

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

# CHAMBERS'S

## NEW

# AMERICAN *ENCYCLOPÆDIA*.

**MERINO**, an important breed of sheep, originally Spanish, but now widely diffused throughout Europe, and constituting a great part of the wealth of Australia. The *M.* has large limbs, and the male has large spiral horns, which do not rise above the head; the skin of the neck is loose and pendulous; the cheeks and forehead bear wool; the fleece is fine, long, soft, and twisted in silky spiral ringlets, abounding in oil, which attracts dust, so that it has generally a dingy appearance. The fleece is sometimes black, and black spots are apt to appear even in the most carefully bred flocks. The *M.* sheep fattens slowly, and owes its value altogether to the excellence of its wool. It has not been found profitable in Britain, where the production of mutton is a great part of the object of the sheep-farmer.

**MERINO.** See **WOOLEN MANUFACTURE**.

**MERIONETH**, a county of Wales, is bounded on the w. by Cardigan Bay, and on the n. by the counties of Caernarvon and Denbigh. Area, 835,291 acres; pop. (1871) 44,593. The coast immediately south of the town of Harlech rises into cliffs, is skirted by sands, and fringed by three dangerous sandbanks at some distance out to sea. *M.* is the most mountainous county in Wales, although its peaks do not rise to the height of some of those in Caernarvonshire. The chain comprising the highest peaks runs from north-west to south-east, and its summits are Arran Mowdddy (2665 feet) and Cader Idris (q. v.). The county is watered by the Dee, which flows north-east, and by the Mawddach and the Dovey, which reach the sea after a south-west course. The soil of *M.* is generally poor, and large tracts are unfit for profitable cultivation. Of the total acreage, only 151,291 acres were under crop in 1876; and of this portion 113,698 acres were in permanent pasture. There were 376,968 sheep in the county. Slate and limestone are largely quarried; a little lead and copper is mined; and of late gold has been found in Merioneth. In 1866, there were obtained at Castell Carnodochan 529 oz. of gold, and at Vigra and Clogau, 214 oz. Woollens and flannels are manufactured. Chief town, Dolgelley (q. v.).

**MERIVALE**, John Herman, an English scholar and translator, was born at Exeter in 1779, studied at St John's College, Cambridge, and was called to the bar in 1805. He contributed largely to Bland's "Collections from the Greek Anthology," published in 1813, and brought out a second edition himself in 1833. From 1831 to his death in 1844, he held the office of Commissioner of Bankruptcy. Among his other literary performances may be mentioned "Poems Original and Translated" (1841), and "Minor Poems of Schiller" (1844).—*M.*, the **REV CHARLES**, son of the preceding, was born in 1809, studied at St John's College, Cambridge, where he took his degree in 1830, and was successively scholar, fellow, and tutor. He has acquired a great reputation as an author by his "Fall of the Roman Republic" (1853), "History of the Romans under the Empire," 8 vols. (1859-65), and Boyle Lectures (1864-65), &c. *M.* was installed Dean of Ely in 1869.—Another son, **HERMAN**, born in 1805, was appointed Professor of Political Economy at Oxford in 1837, and permanent Under Secretary of State for India in 1859. In the same year he was made C.B. He also wrote on colonization. He died on February 8, 1874.

**MERLE D'AUBIGNE**, Jean Henri, a popular ecclesiastical historian, was born at Eaux-Vives, near Geneva in Switzerland, 16th August 1794, studied there and at Berlin—under Neander—and subsequently became pastor of the French Protestant Church in Hamburg. Thence, after a residence of five years, he proceeded to Brussels, became chaplain of King William, who, after the revolution of 1830, invited him

Merlin  
Merseburg

2

to Holland, as tutor to the Prince of Orange. M., however, declined the offer, and returning to Geneva, took part in the institution of a new college for the propagation of orthodox theology, in which he was appointed Professor of Church History. With the exception of some visits to England and Scotland, where he had numerous readers and admirers, he remained constantly at Geneva. The work which has given him so widespread a reputation is his "*Histoire de la Réformation au seizième Siècle*" (1835, et seq.). It is written with the utmost vivacity, and is sometimes eloquent. Its popularity has been immense. Among M. D.'s other writings are—"Le Luthéranisme et la Réforme" (Par. 1844); "Germany, England, and Scotland" (1848); "Le Protecteur, ou la République d'Angleterre aux Jours de Cromwell" (1848); "Trois Siècles de Lutte en Ecosse" (1850); "Caractère du Réformateur et de la Réformation de Genève," and "Histoire de la Réformation en Europe au Temps de Calvin" (1862—1877). He died at Geneva, 20th October 1872.

**MERLIN** (*Falco cæalon* or *Hypotriorchis cæalon*), the smallest of the British *Falconidae*, scarcely exceeding a black-bird in size, but very bold and powerful, and possessing all the characters of the true falcon, with the distinction of large hexagonal scales on the front of the tarsal. It is of a bluish ash color above; reddish yellow on the breast and belly, with longitudinal dark spots, the throat of the adult male white. The wings reach to two-thirds of the length of the tail. It builds its nest on the ground, and is fond of localities where large stones are plentiful, on which it is often to be seen perched, and is therefore often called the *Stone Falcon*. It is common in most parts of Europe, is found in Asia and North America, and extends southwards in Africa, even to the Cape of Good Hope. It was of great repute in the days of falconry, being very easily trained, and flying readily at its quarry. It was therefore often used for taking partridges and wood-pigeons. It is a very lively bird, and often utters a harsh scream. It usually flies low and very rapidly, threading its way, if necessary, through branches and leaves, but it will also follow its prey in mounting upwards to a great height.

**MERLIN**, the name of an ancient Welsh prophet and enchanter, who is believed to have flourished during the decline of the native British power in its contest with the Saxon invaders. Both the Cambrian and the Strathclyde Britons boasted of a M. who was, in all probability, the same personage decked out in different legendary guise.—The Cambrian M., called *M. Emrys* or *Ambrosius*, is said by Geoffrey of Monmouth, in his "*Historia Brittonum*," to have lived in the 5th c., to have sprung from the intercourse of a demon with a Welsh princess, and to have displayed the possession of miraculous powers from infancy. He is alleged to have been the adviser of King Vortigern, and subsequently of Ambrosius, Uterpendragon and the great King Arthur. He is often alluded to by our older poets, especially Spenser, in his "*Fairy Queen*," and also figures in Tennyson's "*Idylls of the King*." He has been made the subject of a metrical romance, of which there is a manuscript copy in the Advocates' Library in Edinburgh. (For an analysis of this romance, see Ellis's "*Specimens of Early English Metrical Romances*.") A collection of prophecies attributed to him appeared in French (Paris, 1496), in English (Lond. 1529 and 1533), and in Latin (Venice, 1554); and their existence is traceable as least as far back as the time of the poet Lawrence (*circa* 1860).—The Strathclyde, or—if we may be allowed an expression which anticipates history—the *Scottish M.*, called *Merlin*, the *Wyllt*, or *Merlin Caledonius*, is placed in the 6th c., and appears as a contemporary of St Kentigern, Bishop of Glasgow. His grave is still shown at Drummelzier, on the Tweed, where, in attempting to escape across the river from a band of hostile rustics, he was impaled on a hidden stake. A metrical life of him, extending to more than 1500 lines, professedly based on Armorican materials, and incorrectly ascribed to Geoffrey of Monmouth, was published by the Roxburghe Club in 1830. His prophecies—published at Edinburgh in 1615—contain those ascribed to the Welsh Merlin.

**MERLON**, in Fortification, is the portion of the parapet between two embrasures. Its length is usually from 15 to 18 feet.

**MERMAID** (i. e., sea-maid), an imaginary inhabitant of the sea. The upper parts of mermaids are represented as resembling those of a human being, generally of a female—although the *Merman* is also sometimes heard of—whilst the body ter-

minates in a tail like that of a fish. There is an evident affinity between the stories concerning mermaids and those concerning the sirens and tritons, perhaps also the nereids, of the ancients. The probability is that these stories have originated in the appearance of seals, walruses, and perhaps still more of the herbivorous cetacea, in regions where they are rare, or to persons unaccustomed to see them. "Large allowance must be made for the workings of an excited imagination, in situations of solitude and apprehension, on the unexpected appearance of an extraordinary and unknown object." Many of the stories concerning mermaids belong to the northern parts of the world, where the herbivorous cetacea are of rare occurrence, and perhaps some of the solitary seals have often given occasion to them. But the herbivorous cetaceans do occasionally wander into the British, and probably even into more northern seas. Sir James Emerson Tennent says concerning the Dugong (q. v.): "The rude approach to the human outline, observed in the shape of the head of this creature, and the attitude of the mother while suckling her young, holding it to her breast with one flipper, while swimming with the other, holding the heads of both above water; and when disturbed, suddenly diving and displaying her fish-like tail—these, together with her habitual demonstrations of strong maternal affection, probably gave rise to the fable of the mermaid; and thus that earliest invention of mythical physiology may be traced to the Arab seamen and the Greeks, who had watched the movements of the dugong in the waters of Maabar." It is right, however, that we should bear in mind the possibility of the existence in the ocean of cetaceans not yet known to naturalists.—The mermaid is a not unfrequent heraldic bearing. In the heraldry of France, she is called a Siren, and in Germany she is occasionally furnished with two fishy tails.

**MERMAID'S GLOVE** (*Hatichondria palmata*), a sponge pretty common in the British seas, and the largest of British sponges. It grows in deep water, and is sometimes two feet in height. It receives its name from the somewhat finger-like arrangement of its branches. It is not slimy, and has a very porous surface; rough, with myriads of minute fragile spicules. Its color is yellowish.

**ME'ROË.** See **ETHIOPIA**.

**MERO'PIDÆ.** See **BEZ-EATER**.

**MEROVINGIANS**, the first dynasty of Frankish kings in Gaul. The name is derived from Merwig or Merovaens, who ruled about the middle of the 5th c., having united a few tribes under his sway. His grandson, Chlodwig or Clovis (q. v.), greatly extended his dominions, and on his death divided his kingdom among his four sons, one of whom, Chlotar or Clotaire I., re-united them under his own sway in 568. On his death in 561 the kingdom was again divided into four parts—Aquitaine, Burgundy, Neustria, and Austrasia. His grandson, Clotaire II., again united them in 613; but after his death in 628, two kingdoms, Neustria and Austrasia, were formed, in both of which the Merovingian kings retained a merely nominal power, the real power having passed into the hands of the mayors of the palace. The dynasty of the M. terminated with the deposition of Childeric IV. in 752, and gave place to that of the Carolingians (q. v.), sprung from the Austrasian mayor of the palace.—The chief authority for the earlier parts of the history of the M., is Gregory of Tours. See also Thierry's "Recits mérovingiens" (Par. 1839), and Pertz, "Geschichte der merov. Hausmeier" (Leip. 1819).

**MERRIMAC**, a river of New England, U. S., rising in New Hampshire, and falling into the Atlantic Ocean at Newburyport, after a course of about 120 miles. It receives several small tributaries, and has numerous falls, affording immense water-power, on the principal of which are the manufacturing towns of Nashua and Manchester, in New Hampshire, and Lowell and Lawrence, in Massachusetts. Navigable 15 miles to Haverhill.

**MERSEBURG**, a town of Prussian Saxony, capital of a circle of the same name, on the Saale, 60 miles south-south-east of Magdeburg. The cathedral, a noble specimen of medieval architecture, is surmounted by four beautiful towers, and has one of the largest organs (with 4000 pipes) in Germany. It contains the monument of Rudolf of Swabia, an aspirant to the imperial title, who was here defeated and slain (1080) by Henry IV.; a bronze plate in low relief, probably the oldest medieval effigy extant. The castle—a picturesque edifice, mostly of the 15th c.—was once a real-

dence of the Saxon princes. Cotton and woollen goods, paper, and tobacco are here manufactured, and bleaching and brewing are carried on. The beer of M. is famous. Pop. (1875) 13,678. It was near this town that the emperor Henry the Fowler gained his famous victory over the Hungarians in 934.

**MERSEY**, an important river of England, separates, in its lower course, the counties of Cheshire and Lancashire, and has its origin in the junction of the Thame and Goyt, on the borders of Derbyshire, east of Stockport. It flows in a west-south-west direction, and is joined on the right by the Irwell from Manchester, at which point it becomes navigable for large vessels. Besides the Irwell, the chief affluents are the Bollin and the Weaver from Cheshire. At its junction with the Weaver, the M. expands into a wide estuary, which forms the Liverpool channel. The estuary is about 16 miles long, and from 1 to 8 miles broad; opposite Liverpool it is a mile and a quarter in width, with a considerable depth at low water. It is much obstructed by sandbanks; but the excellent system of pilotage in practice here renders the navigation comparatively secure. Cougars, shrimps, flounders, and sparlings abound in the river and estuary. Entire length with the estuary, nearly 70 miles.

**MERTHYR-TY'DVIL** is a market-town of South Wales, with a population, in 1871, of 51,949 within the parish, which has a local board of health. The parliamentary borough embraces Aberdare and two other outlying districts; pop. 97,090. It is on the northern border of the county of Glamorgan, abutting upon the county of Brecknock, and surrounded by lofty hills. It is built upon the river Taff, 500 feet above sea-level, 34 miles from its mouth and port at Cardiff; and it includes the junctions of the greater and lesser Taff, the Morlais, and the Dowlais, streams which there unite to constitute the main river. M. is the seat of the iron trade of Glamorgan, as represented by the great works of Dowlais, Cyfarthfa, and Plymouth, and in a less degree by that of Penydarren. It also contains large collieries, and is celebrated, with Aberdare, for the excellence of its steam coal. The annual make of finished iron in this place, chiefly in the shape of rails, merchant-bars, girders, and ship-plates, may be stated roughly at 200,000 tons. The exports of coal are considerable, and are increasing, but the chief consumption is within the works. The population are all directly dependent upon the works, there being no other trade or manufacture. Railways branch from M. to Brecon, to Swansea, to Cardiff and Penarth, and to Newport and Hereford. The borough was created by the first Reform Act, and now returns two members. Its chief town-officer is the headborough of the lordship, called the "High Constable," and its government is vested in a Local Board. Dowlais contains some fine public buildings, but M. is deficient in this respect. Though a busy, it is not a striking place, having risen very rapidly with the local trade, and having attained nearly its present dimensions before it was under any but the ordinary parochial government. There are, however, symptoms of improvement. It is well supplied with water, and the infantile mortality, long extraordinary, is now reduced. The people, chiefly Welsh, are industrious, and, on the whole, very orderly. There are 17 established churches, and 118 dissenting chapels in the borough.

**MERTON COLLEGE**, Oxford. The House of the Scholars of Merton, commonly called M. C., the model of all the secular colleges, was first founded in Maldon in Surrey by Walter de Merton, Bishop of Rochester, and Lord High Chancellor, in 1264, for the maintenance of 20 scholars in the schools of Oxford, and of a warden and three or four ministers of the altar, who were to manage the property. Before 1274, he transferred his warden and ministers to Oxford—thereby not only founding his own college, but contributing in no small degree to fix the university in its present locality. The fellows were to be as many as the means of the house could maintain, and after some changes, this number was fixed by Archbishop Laud at 24. They were to be elected first and chiefly from the founder's kin; but this was from an early period evaded, and the commissioners of 1552 speak of "a common belief in the university that the elections to fellowships at Merton were formerly determined by personal interest." In 1290, Dr Wyllot, Chancellor of Exeter, endowed twelve *portionists*, or postmasters as they are now called, equivalent to the scholars of other colleges; and in 1604, John Chamber, fellow of Eton, endowed two more—restricted, however, to foundationers from Eton. By the ordinances under 17 and 18 Vict. c. 81, considerable changes were made—six fellowships were

suspended, of which two were assigned to increase the postmasterships, &c., and four to the endowment of the Linacre professorship of physiology, of value £800 per annum. The remaining 16 were thrown open, and not to exceed £250 per annum, exclusive of rooms, until the original number of 24 was restored. The number now being completed, they have reached their limiting value of £500. Sixteen postmasterships, and four scholarships (founded by Henry Jackson in 1753), each of the value of £80 a year, are open without restriction, and tenable for 20 terms from election; but the two postmasterships on the foundation of John Chamber are only to be thrown open in default of candidates from Eton being found duly qualified. This college possesses 18 benefices, to some of which, however, certain other patrons present in turn.

**MERU**, in Hindu Mythology, a fabulous mountain in the centre of the world, 80,000 leagues high. It is the most sacred of all mythical mountains, the abode of Vishnu, and endowed with all imaginable charms.

**MERULIDÆ**, or *Turdidæ*, a family of birds of the order *Insectores*, sub-order *Dentirostres*, having arched and compressed bills, which are pointed and notched, but not strongly. They are regarded by many naturalists as intermediate between the *Laniadæ* (Shrikes, &c.) and the *Sylviadæ* (Warblers, &c.). The species are very numerous, and are arranged in many genera. They are very widely distributed over the globe, some of them being found in cold and some in warm climates. Some are migratory; a few species are gregarious at all seasons, many are gregarious only in winter. They generally build their nests in trees. They feed chiefly on soft animal and vegetable substances, as berries, insects, and worms. Many of them are birds of very sweet song; some are remarkable for their imitative powers. To this family belong thrushes (among which are reckoned the black-bird, rookwing, fieldfare, ring-ouzel, &c.), orioles, mocking-birds, dippers, &c.

**MESAGNA**, a town of the province of Lecce, in Southern Italy, situated amidst scenery of oriental beauty, 37 miles north-west of Lecce, and surrounded by strong walls. The district around is fruitful, and yields delicious oil, which forms an important article of the trade of Mesagna. Pop. 8500.

**MESEMBRYACEÆ**, or *Ficoideæ*, a natural order of exogenous plants, both herbaceous and shrubby, but all succulent. As defined by some botanists, it includes the orders *Tetragoniaceæ*, *Sesuviaceæ*, &c., of others. Of the more restricted M., about 400 species are known, a few of which are natives of the south of Europe, but none are British; the greater number belong to South Africa and the South Sea Islands.—The Ice Plant (q. v.) belongs to this order. The leaves of some species when burned, yield soda in great abundance. Large quantities of burilla are made from them in the Canary Islands, in Spain, and in Egypt. The seeds of some, as *Mesembryanthemum crystallinum* (the Ice Plant), and *M. geniculiflorum*, are ground into flour to make bread. *M. geniculiflorum* is used as a pot-herb in Africa. The fruit of *M. edule* (Hottentot's Fig) is eaten in South Africa, and that of *M. acutilaterale* (Fig's-faces) in Australia.—*M. emarcidum* is called *Kou* by the Hottentots, who beat and twist up the whole plant, allow it to ferment, and chew it like tobacco. When newly fermented, it is narcotic and intoxicating.—Some species of *Mesembryanthemum* are now common annuals in flower-gardens in Britain.

**MESENTERY**, Mesenteric Disease. The mesentery derives its name from being connected to the middle portion (Gr. *meson*) of the small intestine (*enteron*). It is a broad fold of peritoneum (the great serous membrane of the abdomen), surrounding the jejunum and the ileum, and attached posteriorly to the vertebral column. Its breadth between the intestinal and vertebral borders is about four inches; its attachment to the vertebral column is about six inches in length, and its intestinal border extends from the duodenum to the end of the small intestine. It serves to retain the small intestines in their place, while it at the same time allows the necessary amount of movement, and it contains between its layers the mesenteric vessels, the lacteal vessels, and mesenteric glands. These glands are 100 to 150 in number, and are about the size of an almond. They exert an organising action on the contents of the lacteals, the chyle being more abundant in flurine and in corpuscles after it has passed through them. Hence, it is obvious that disease of these

Meshid  
Moss

6

glands must always seriously affect the process of assimilation. The most important affection of these organs is their scrofulous or tubercular degeneration, which gives rise to the disease known as *Tubercles Mesenterica*, a disease most common in childhood, but confined to no period of life. In the great majority of cases, it is associated with, and often marked by, other results of the tubercular or scrofulous diathesis, such as pulmonary consumption, tubercular peritonitis, scrofulous disease of the spine, rickets, &c.; but sometimes the mesenteric glands seem almost exclusively affected, in which case the disease becomes sufficiently distinct to allow of easy detection. The leading symptoms are acceleration of the pulse, occasional fever, especially towards evening, loss of color and flesh, derangement of the digestive organs (constipation or diarrhoea, and occasional vomiting), a steady pain in the region of the navel, increased by pressure; but perhaps the most characteristic symptom is tumefaction and hardness of the abdomen, with general emaciation. The enlarged glands can sometimes be detected by a careful examination with the hand, especially in advanced cases. The progress of the disease is generally slow, but at length hectic fever sets in, the emaciation becomes extreme, dropsical effusion appears, and the patient dies exhausted, if not cut off by the access of some acute inflammation.

The treatment mainly consists in the administration of cod-liver oil, or, if the stomach is too irritable to bear that medicine, of iodide of potassium, combined with some bitter infusion, the bowels being at the same time carefully attended to. The application of stimulating liniments, or of iodine ointment, or the abdomen is often of great service. When the disease has advanced to a considerable extent, remedies are of little use, except to palliate some of the more urgent symptoms.

Independently of the disease that has just been noticed, inflammation of these glands is by no means uncommon, when the mucous membrane of the small intestine is ulcerated, as, for example, in typhoid or enteric fever.

MESHID, a important city of Persia, capital of the province of Khorassan, in a fertile and well-cultivated plain, on the Tejend, in lat.  $36^{\circ} 17'$  n., long.  $59^{\circ} 40'$  e. It is by far the most important town of the north-east of Persia, being the centre of numerous converging routes. The city presents a surprising and beautiful view from a distance. Above the walls, which are of vast circuit, shine the gilded dome of one of the most splendid mosques of the East, the beautiful minarets of the tomb of Imaum Riza, a follower of Ali, and the summits of other sacred buildings. M., as the chief seat of the great sect of the Shiites, is of nearly equal importance with Mecca, the sacred city of the orthodox Mohammedans, and hence it abounds in "holy" men, arrayed in green turbans and sashes, who instruct the pilgrims visiting the city. The town carries on manufactures of woollen goods and of metal-ware, especially sword-blades, gold work, and articles of jewellery. It is a famous place of pilgrimage, and a centre, to some extent, of education. Caravans arrive almost daily. Pop. 70,000. In the neighborhood are the ruins of Thus, the old capital of Khorassan, which contains the tomb of the celebrated poet Firdusi.

MESILLA, a town and valley on the Rio Grande, New Mexico, U.S., acquired of Mexico in 1834 by purchase, under the Gadsden treaty. Lat.  $32^{\circ} 17'$  n., long.  $106^{\circ} 45'$  w. It is a narrow, but fertile valley, on the southern overland route to California. The town, settled in 1850, had in 1870 a population of 1878.

MESMER, Franz (according to others, Friedrich-Anton), the founder of the doctrine of Animal Magnetism (q. v.), or Mesmerism, was born in 1733 or 1734, at a village near the Bodensee. He studied at Vienna, and there took the degree of Doctor of Medicine in 1766. About 1772, he began, along with Father Hell, to investigate the curative powers of the magnet, and was led to adopt the opinion, that there exists a power similar to magnetism, which exercises an extraordinary influence on the human body. This he called Animal Magnetism, and published an account of his discovery, and of its medicinal value, in 1775. Honors were conferred upon him in Germany. In 1778, he went to Paris, where he attracted much attention. His system obtained the support of members of the medical profession, as well as of others; but he refused an offer of an annual pension of 20,000 livres (about £800) to reveal his secret; and this, combined with other circumstances, gave rise to suspicion, and induced the government to appoint a commission, composed of physicians and naturalists, whose report was unfavorable to him. He now fell into disrepute, and

after a visit to England, retired to Meersburg, where he spent the rest of his life in complete obscurity. He died March 5, 1816.

**ME'SMERISM.** See **ANIMAL MAGNETISM**.

**MESNE LORD** is, in English Law, a lord who is himself a tenant to some other lord, called a lord paramount. The phrase is, however, not now used, because subinfeudation was abolished in the time of Edward I.—**MESNE PROCESS** was the name given to writs which issued in respect of a pending action before final judgment was given.—**MESNE PROFITS** are the profits or rents drawn by a person who is wrongfully in possession of real property, and who is afterwards ejected, in which case the mesne profits are recoverable, along with the estate itself.

**MESOPOTAMIA** (Gr. *mesos* middle, and *potamos*, a river), the region between the Euphrates and the Tigris; but the name is generally applied to the northern part of this region, which is called by the Arabs *Al-Jesira* (the Island). The northernmost districts of M. are mountainous, being penetrated by the southern spurs of the mountains of Armenia; all the rest is a plain, rarely broken by rocky heights. This plain is dry steppe, green with vegetation only in the wet season; but wherever it is naturally watered, or artificially irrigated, it displays fertility. The inhabitants consist chiefly of Turks, Kurds, Turcomans, and Yesids, with Armenians in the north, and Syrians and Arabs in the plains. The chief occupation of the people is the feeding of cattle; and of the civilisation of ancient times, or even of that which prevailed in a later period (during the Ayubite rule), few or no traces now exist. M. forms a part of the Turkish empire, and is divided into several *eyalets* or governments. For the history of the country, see **AS SYRIA**, **BABYLONIA**.

**MESOZOIC** (Gr. *middle-life*), a term introduced by Professor Phillips to designate the group of geological periods, the fossil remains of which differ equally from those of the **Palæozoic** (ancient-life) and **Cainozoic** (newer-life) epochs. It is synonymous with the more generally employed term **Secondary**, and includes the rocks of the Triassic, Oolitic, and Cretaceous periods.

**ME'SPILUS.** See **MEDLAR**.

**MESS** (Fr. *mete*, Old Fr. *mes*, Ital. *messo*, a dish, from Lat. *misetum*, sent, or served up) originally signified a dish or portion of food; but is used in the British army and navy in the sense of a number or association of officers or of men taking their meals together. In societies consisting entirely of the male sex, and of one set of men continually thrown together, it is a very important social point that the mess should be well regulated. There are consequently stringent rules—both of the service and of mutual etiquette—laid down for its government. One officer acts as caterer, receives subscriptions from the several members, charges the wine to those who drink it, &c.; a steward has charge of the more menial department, arranging for the cooking, purchase of viands, servants, rations, &c.

In the navy, the Admiralty lend the plate and glass; in the army, such expenses are met by the mess fund, which is kept up by a contribution not exceeding thirty days' pay, or difference of pay, on the appointment or promotion of an officer, and an annual subscription from each officer not exceeding eight days' pay, which subscription, in the case of subalterns, is, since 1872, paid by the state. Of course, each officer has to pay periodically his share of the general expense for provisions, &c. In the navy, this expense is limited to £3 a month per head for the ward-room mess, and £1 10s. in the gun-room. In the army, there is no specific limit, but commanding officers are enjoined to enforce proper economy. Government assists the mess of regiments serving at home, and on certain foreign stations where the necessities of life are expensive, with an annual allowance of £25 for each troop or company. The whole of this allowance is to be applied in aid of the cost of the first allowance of wine, and towards reducing the daily expense of the mess, &c. The annual vote for this allowance is about £40,000.

In regiments, there is the officers' mess, to which all the officers of the regiment are bound to subscribe their regulated entrance-fee; but it is optional with married officers to use it or not, and if they elect not to do so, they are exempted from the annual contribution, and only pay for their share of the consumption on the special occasions when they may attend. The sergeants have also a mess, when the commanding officer can succeed in establishing one. It is considered necessary for dis-

Messalina  
Messiah

8

cipline that these messes should be quite exclusive, though, in continental armies, and especially the French, the case is different, the utmost familiarity being encouraged between all ranks when off duty. The social equality of officers and men, due to conscription and promotion from the ranks, suffices to account for this difference of system. The sergeants draw their *Rations* (q. v.), supplementing them at their discretion; the officers can draw them or not (through their messman) but on foreign stations they almost invariably do so.

There is no mess for staff-officers with an army, unless they form private arrangements among themselves. In the British navy, if the ship be small, there is one general mess—the gun-room—to which all the officers must belong. If the vessel have a considerable complement, there is the ward-room mess (of which the captain is not an effective member, as he dines in his own suite of cabins), for the commander, lieutenants, master, chaplain, paymaster, marine officers, surgeon, assistant-surgeon, and chief-engineer; the gun-room, for sub-lieutenants, second masters, midshipmen, cadets, and master's assistants; and the engineers' mess (governed by the rules for the gun-room), for engineer officers below the rank of chief-engineer. Officers or civilians voyaging in a ship of war as passengers are ordinarily elected honorary members of the mess to which their rank would entitle them. Rations are not issued to members of a mess; but each is granted, in lieu thereof, an allowance of £1 a month, with the power of purchasing ship's provisions at government rates. Common seamen and common soldiers, in the navy and army respectively, *mess* together in tables comprising a certain number, according to their ratings or squads; but this has no reference to the technical meaning of *messing* as applied to officers, and is merely for the purpose of economy of fuel and labor in the cooking of their rations.

**MESSALINA.** Valeria, the daughter of Marcus Valerius Messala Barbatus, and wife of the Roman emperor Claudius, a woman infamous for her lasciviousness, her avarice, and the atrocities which she perpetrated. Taking advantage of the weakness and stupidity of the emperor, she played the adulteress without restraint, and unreluctingly caused all to be put to death who stood in the way of her unhallowed gratifications. The best blood of Rome flowed at her pleasure. Among her victims were the daughters of Germanicus and Drusus, Julia and Antonia, M. Vinicius, Valerius Asiaticus, and her confederate Polybius. She went so far in vice as to offer her charms for sale like a common prostitute; and at last, during a temporary absence of the emperor, she publicly married one of her favorites, G. Silius, upon which Narcissus, one of the emperor's freedmen, represented to him that M. was aiming at his destruction, and received orders for her execution. She was put to death by Eudus, a tribune of the guards, in the gardens of Lucullus, 48 A.D. Her name has become a by-word for crime and lust.

**MESSENGERS.** King's (Queen's), officers employed by secretaries of state to convey dispatches at home and abroad. In former days, their occupation consisted, to a considerable extent, in serving the secretaries' warrants for the apprehension of persons accused of high treason and other grave offences against the state, nor was it unusual for them to keep the prisoners whom they apprehended at their own houses. They are now principally employed in foreign service.

**MESSENGERS-AT-ARMS,** the officers who execute the process and letters of the Courts of Session and Justiciary in Scotland. They are appointed by, and are under the control of the Lyon King-at-Arms (q. v.). Act 1587, c. 45, contains various provisions regarding these officers, which show that, prior to that period, the Lyon exercised jurisdiction over them, both as to their admission and the trial of complaints against them. There are a certain number of messengers-at-arms in every county of Scotland, amounting in all, at present, to about one hundred.

**MESSENEA,** a district in the south-west of the Peloponnesus, bounded on the e. by Laconia, on the n. by Arcadia and Elis, and on the s. and w. by the sea. It was composed chiefly of extensive plains, watered by the *Pamisos* and other streams. Those plains were famous for their fertility, and particularly for their wheat-harvests. At an early period, after the Doric conquest, it rose to power and opulence. Its chief cities were Messene, Methone, and Pylor. It is chiefly noted for its two wars with Sparta, known as the Messenian Wars, the first of which

(according to the common chronology) lasted from 743 to 724 B.C.; and the second from 685 to 686 B.C. In both instances, the Messenians were defeated, and in consequence, a great part of them emigrated to Sicily, where they took possession of Zancle, which then received the name of Messana, the present Messina. After the lapse of 300 years, Epaminondas invited their descendants back to Greece, and they joyfully responded to his invitation. M. is the name of one of the *nomarchies* of the modern kingdom of Greece.

MESSIAH (Heb. *Mashiach*), equivalent to the Greek *Christos*, the Anointed, designates, in the Old Testament, the great deliverer and Saviour, whom the Jews expected to be sent by God, not only to restore their country to the power and splendor which it exhibited in the days of David, but even, by compelling the Gentiles to acknowledge the supremacy of the theocratic people, to raise it to the summit of universal dominion. This large conception, however, first begins to develop itself after the time of Solomon; for the oldest biblical records in their Messianic indications refer rather to the high degree of prosperity which the chosen people were to expect for themselves. This expectation, already visible in the Abrahamidae, appeared for a moment to have realised itself in the conquest of Canaan; but the subsequent, and often disastrous wars (in the period of the "Judges" and of Saul), as well as the internal feuds and dissensions of the Hebrews themselves—left it, in point of fact, unfulfilled. Nevertheless, the hope of the appearance of the M. had rooted itself strongly in the people, and during the glorious and peaceful reigns of David and Solomon, had so grown and enlarged, that even after the secession of Israel, and during the momentous ages that elapsed until its destruction as a kingdom, not only was the hope of a universal world-sovereignty, and of an extraordinary degree of prosperity, warmly cherished, but it was also confidently expected that God would raise up a branch from the stem of David as the M., the founder of the national prosperity, and the bringer-in of the all-embracing theocracy. That branch was declared to be "the anointed of the Lord," and since David applied that epithet to himself, the Jews transferred it to the deliverer whom they expected, and called him "Son of David." The prophetic writings contain many such allusions to the M., whose coming was expected shortly, and even during the time of the generation then living, whose birthplace, in congruity with his Davidic descent, was announced to be Bethlehem, and who, it was believed, was to be endowed with Divine attributes. These prophetic allusions are commonly termed MESSIANIC PROPHECIES. Along with such, the prophets associated the idea of a forerunner (Elijah, Jeremias, or Moses), whose function was to prepare the people for the appearance of the Messiah. The coming of the Messianic kingdom was to be preceded by a period of severe misfortune and bitter sorrows, the purpose of which was the reconciliation of the people with God (Isaiah i. 25, &c.; Joel iii.; Dan. ix.; Zech. xiii.). These sorrows are called the woes of the M.; they are minutely described in the second book of Ezechiel—an apocryphal work. Hence spring up the idea of a suffering M.—widely diffused among the Jews—who, by enduring grief and shame, should make atonement for the people, and reconcile them with God. This conception was greatly strengthened by the picture in Isaiah (chapters lii. and liii.), of a "servant of God," which, in fact, is generally regarded as the most distinct prophecy of the Saviour. Hence the step further of considering the M. an offering and sacrifice for the sins of the people, was an easy one; yet, on the other hand, it is singular that no trace of this is found in the Apocrypha, not to mention the popular belief of the Jews, that the M. was to live for ever (John xii. 34), that a crucified Saviour was a stumbling-block to them (1 Cor. i. 23), that even the disciples of Jesus did not comprehend his allusions to his death, and that their faith in him as the M. was for long dim and doubtful. In fact, this popular belief of the Jews was the very reason why they did not recognise Jesus as the Messiah. In the later Judaism (as it shews itself in the Talmud), the conceptions of the M. are rich in singularities. It was believed that the *true* M., the son of David, would be preceded by another Messiah, a son of Joseph, or Ephraim, who should suffer death for men as a sin-offering. Century after century, the Jews have expected the former, and repeatedly have they risen and placed themselves under the standard of dreamers, fanatics, and impostors, who took to themselves the sacred name; as, for example, BAR-COCHBA (q. v.) in the 2d c.; one Moses in the Isle of Candia, in the 5th c.; one Julian in Palestine, in

the 6th c.; several in Persia and Arabia in the 12th c.; and as late as the 16th c.; Sabatai Zevi, in Aleppo. Even yet, the hope of a M. is not dead in the hearts of the strict Talmudistic Jews.

The *crucial* question of theology, however, is not the form in which the doctrine (so to speak) of the M. was held by the Jews. All rational students of Scripture, whether "orthodox" or "heterodox," now admit that its growth was gradual, and that it acquired precision and definiteness of outline in the course of ages from its first rude phase, among the pastoral princes of the Syrian wilderness, down to that sublime yet shadowy personality—the Man of Sorrows—that continually floats before the vision of the "Younger Isaiah." The grand question is: Was this doctrine essentially a Divine inspiration, an objective truth of God, or only a lofty conception of the religious soul? The strict rationalistic theologians maintain—and endeavor to prove by an analytic examination of the Gospels—that Jesus assumed the dignity of M., either to accommodate himself to a rooted conception of his countrymen, or partly because he had come to believe it himself—a conclusion, it is said, at which he might arrive quite honestly, since he felt that the *truth* which he taught was the real and only "kingdom of God," and that therefore he was justified in applying to himself all that was said (tropically) by the prophetic poets in old times concerning him who should usher in this "golden age" of the world's faith. The mass of orthodox theologians, on the other hand, regarding the so-called Messianic prophecies of the Old Testament as positive, divinely suggested (perhaps, even on the part of their authors, *conscious*) predictions of Jesus Christ, repudiate the principle of accommodation, or even spiritual application, and try to show that the Saviour accepted the Messianic prophecies as literally and exclusively applicable to him. The historico-spiritual school, represented in Germany by men like Neander, Rothe, Tholuck, &c., and in England, generally speaking, by the divines of the "Broad Church" party, occupy a middle position between these two extremes: with the rationalists, they hold that the Old Testament doctrine of the M. was gradually developed, contains many human elements, and does not imply any knowledge of the historical Jesus on the part of those who announce it; with the "orthodox," on the other hand, they assert that the doctrine is the expression of a fact, not of a sentiment—that Jesus of Nazareth was actually the Son of God, the appointed M., and that in him the so-called Messianic prophecies were fulfilled in a far higher sense than ever the prophets could have dreamed. It will thus be seen that the rationalists resolve the doctrine of the M. into a merely *subjective* religious idea; while the orthodox, and also the historico-spiritual school of theologians, hold that the doctrine was the expression of a divine fact—the *substance* of a heavenly faith.

MESSINA, a city of Sicily, chief town of the province of same name, one of the most ancient and most important cities of the island, is charmingly situated on the strait of M., encircled by a zone of abrupt conical rocks, and commands a view of Calabria. Pop. in 1871, 71,921. The town is enclosed by old walls, and has several fine squares and wide lava-paved streets. The harbor, which is formed by a projecting tongue of land curved in the form of a sickle (whence its primitive name *Zaucle*—Gr. *sickle*—see *MESSANIA*), is about four miles in circumference, and can contain a thousand ships; it is defended by a citadel and six forts; the depth is sufficient to admit vessels of large size; and the quays are spacious. The trade of M., chiefly in silk, oil, wine, coral, fruits, linseed, fish, &c., although less extensive than formerly, is still an important source of wealth to Sicily. The chief imports are cotton and woollen manufactures, hardware, and other articles of colonial produce. The damasks and satins of M. are excellent, and the fisheries important. M. has steam-boat communication with Naples, Marseille, and Malta. In the 16th c., M. was a renowned seat of learning, and in the 16th c. a famous school of painting was founded there by Pelidoro da Caravaggio. In modern times it has undergone terrible vicissitudes, having been ruthlessly bombarded by the royal forces on several occasions during the war of independence in 1848.

MESSINA, Straits of (Ital. *Faro di Messina*, Lat. *Mamertinum fretum*), between Italy and Sicily, are 2½ miles in length, and vary from 2½ to 10 miles in breadth. A strong current runs through the strait, which is of great depth. See *SCYLLA* AND *CHARYBDEIS*.

**ME'SSUAGE**, the legal term used in English law to describe a dwelling-house and piece of land adjoining.

**ME'STRE**, a town of Northern Italy, in the province of Venice, and 5 miles north-west of the city of Venice, on the margin of a lagoon. It is connected with Venice, Padua, and other places by railway. There are many villas around the town and along the road to Padua, reaching almost to that city. *M.* has a considerable transit-trade. Pop. 8500.

**METACE'NTRE**. See **HYDROSTATICS**.

**METAL** (in Heraldry). The field of the escutcheon and the charges which it bears may be of metal as well as of color; and the two metals in use among heralds are gold and silver, known as *or* and *argent*. It is a rule of blazon that metal should not be placed on metal, or color on color.

**METALLURGY**, is the art of extracting metals from their ores. The operations are partly mechanical and partly chemical. Those processes which depend principally on chemical reactions for their results have reference chiefly to the roasting and smelting of ores, and are described under the heads of the different metals. But there are certain preliminary operations of a mechanical kind which metallic ores undergo, such as crushing, jigging, washing, &c., which we shall describe here, as they are essentially the same for the ores of lead, copper, tin, zinc, and indeed most of the metals. (For *Iron*, see that head.)

Ores are first broken up with hammers into pieces of a convenient size for crushing or stamping. Waste material, such as pieces of rock, spar, &c., which always accompany ore, are as far as possible picked out by hand, and the ore itself arranged in sorts according to its purity. Various kinds of apparatus, such as riddles, sieves, &c., are then used for separating it into different sizes, in order to secure a uniform strain on the crushing machinery.

The ore is raised by means of small wagons, to the platform, where it is ready to be supplied to the crushing-rollers. These rollers are mounted in a strong iron frame, held together by wrought-iron bars, and bolted to strong beams. Their distance apart is regulated by means of a lever, to which a weight is attached. The bearings of the rollers slide in grooves, so that when any extra pressure is put upon them by a large or hard piece of ore, the lever rises, and allows the space between the rollers to widen. The crushed ore falls upon a series of sieves, which are made to vibrate. These have meshes increasing in fineness as they descend; and the upper two are so wide that pieces of ore too large to pass through them are conducted into the lower part of the bucket-wheel, and raised again to the platform to be re-crushed. The lower four sieves separate the remaining portion of the crushed ore into different degrees of fineness, which is collected in the pits.

Instead of crushing-rollers, sometimes a stamping-mill is used, especially for tin ores, which require to be reduced to a fine powder. The stamping-mill consists of a series of upright shafts with a weighty piece of iron at the bottom of each. They are raised by means of an axle with projecting cams, and then falling by their own weight, act like hammers.

After being crushed, the ore is washed and sifted on a jigging sieve. The ore is placed on the table from which the sieve is filled. It is then immersed in a tub of water and a jigging motion communicated to it by a workman alternately raising and lowering a handle. This effects two purposes—it washes the ore, and it separates the material into two layers: the upper consists of the lighter spar and other impurities, which are raked off; and the lower consists of the heavier and purer portions of the ore, which are now ready for the roasting furnace.

It will be apparent that in the bottom of the tub there must be a quantity of more or less valuable ore, which, from its fineness, has fallen through the sieve. This is called *sludge* or *slime*; and the minute particles of ore it contains are recovered either by simply forming an incline on the ground, and washing it with a current of water, or by using an inclined table, called a *slewing-table*. Ore which has been reduced to powder at the stamping-mill, as well as *slime*, is washed by this apparatus. The material is put into the chest, which is placed in a sloping position, and is supplied with water on turning the stopcock. The current carries the contents of the chest through the opening at the bottom, and spreads it, with the aid of a series of

stops, or small bits of wood, over the surface of the table. A stream of water is then kept flowing over the table till the earthy impurities are all carried down into the trough, the pure particles of the ore remaining, by reason of their greater specific gravity, near the top of the table, whence they are removed to be smelted. Sometimes the table is suspended by chains, and receives a succession of blows at the top from a *buffer*, moved by cams on the same principle as the stamping-mill. This arrangement is found of great advantage in dressing very poor ores.

The variety of machinery and apparatus used in dressing ores is very great, and they pass under different names in different districts, but they are all very similar in principle to those we have described.

**ME'TALS, ME'TALLOIDS.** Although each metal is considered in a separate article, there are various points regarding the general physical and chemical characters of these bodies, and the method of classifying them, which require notice.

It is not easy to define a metal. All the elements are usually divided by chemists into two groups—viz., the non-metallic bodies or metalloids, and the metals; the list of non-metallic bodies containing all those elements in which the characteristic properties of the bodies popularly known as metals (such as silver, gold, iron, &c.) are wanting; these characteristic properties being their metallic lustre, their opacity, and their capacity of conducting heat and electricity. The non-metallic elements are 14 in number—viz., oxygen, hydrogen, nitrogen, sulphur, selenium, tellurium, phosphorus, chlorine, bromine, iodine, fluorine, carbon, boron, and silicon, of which five are gases, one a liquid, and the rest are solids at ordinary temperatures.

The division of the elements into these two great groups is, however, not based upon any definite scientific grounds, and it is still an open question whether some of the metalloids, as, for example, tellurium and silicon, should not be placed amongst the metals. The non-metallic bodies or metalloids being only remarkable as a group for their negative properties, require no special consideration, and we therefore proceed to notice the general properties of the metals.

The following are the most important of the *physical* properties of the metals.

1. All metals, unless when they are in a finely pulverised form, exhibit more or less of the characteristic lustre termed metallic. Two of the non-metallic elements, iodine and carbon, in some forms, present also a metallic lustre.
2. All metals are good conductors of heat and electricity, although in very unequal degrees.
3. With the exception of mercury, all the metals are solid at ordinary temperatures. With the exception of gold, copper, calcium, and strontium, the metals are more or less white, with a tendency to blue or gray. Most of them have been obtained in crystals, and probably all of them are capable of crystallising under certain conditions.
4. Metals are remarkable for their opacity, and, with the exception of gold, do not transmit light, even when they are reduced to extremely thin leaves.
5. All the metals are fusible, although the temperatures at which they assume the fluid form are very different (see *FUSING POINTS*); and some of them, as mercury, arsenic, cadmium, zinc, &c., are also volatile.
6. Great weight, or a high specific gravity, is popularly but erroneously regarded as a characteristic of a metal; while platinum, osmium, and ridium (the heaviest bodies known in nature), are more than 20 times as heavy as water, lithium, potassium, and sodium are actually lighter than that fluid.
7. Great differences are observable in the hardness, brittleness, and tenacity of metals. While potassium and sodium may be kneaded with the finger, and lead may be marked by the finger-nail, most of them possess a considerable degree of hardness. Antimony, arsenic, and bismuth are so brittle that they may be easily pulverised in a mortar; while others, as iron, gold, silver, and copper, require great force for their disintegration. Taking iron and lead as representing the two extremes of tenacity, it is found that an iron wire will bear a weight 26 times as heavy as a leaden wire of the same diameter. See *DUCTILITY, MALLEABILITY*.
8. It is a remarkable property of the metals, that none of them are capable of being dissolved without undergoing chemical change. Sulphur, phosphorus, iodine, &c., may be dissolved, and after the evaporation of the solvent, may be re-obtained with all their original properties; but this is never the case with metals.

Amongst the chief *chemical* properties of metals we next notice:

Their strong affinities to certain of the non-metallic elements. All the metals, without exception, combine with oxygen, sulphur, and chlorine, and often in several

proportions, forming oxides, sulphides (formerly termed sulphurets), and chlorides. Many of them combine with bromine, iodine, and fluorine. The other compounds of this nature, excepting carbide (formerly carburet) of iron, or steel, and the hydrides of arsenic and antimony (commonly known as arseniuretted and antimonyuretted hydrogen), which are of importance in toxicology, may be passed over without notice.

The metallic oxides are, without exception, solid bodies, insoluble in water, and usually present a white or colored earthy appearance. Hence the old name of *metallic calx* for these oxides.

Those oxides which are termed basic possess the property of directly uniting with the so-called oxyacids (such as sulphuric, nitric, carbonic, and silicic acid), and of forming a new chemical compound of the second order, termed a *salt* (q. v.).

The compounds of the metals with chlorine, iodine, bromine, and fluorine, such, for instance, as chloride of sodium, or common salt ( $\text{ClNa}$ ), are termed *haloid salts* (q. v.). The same metal may often combine both with chlorine and with oxygen in more than one proportion. For example, we have subchloride of mercury ( $\text{Hg}_2\text{Cl}$ ); suboxide of mercury ( $\text{Hg}_2\text{O}$ ); chloride of mercury ( $\text{HgCl}$ ); oxide of mercury ( $\text{HgO}$ ). For the compounds of the metals with sulphur, see **SULPHIDES OF THE METALS**.

Metals enter into combination with one another when they are fused together, and such combinations are termed *Alloys* (q. v.), unless when mercury is one of the combining metals, in which case, the resulting compound is termed an *amalgam*. It is doubtful whether all alloys are true chemical compounds. Definite compounds of the metals with each other do, however, certainly exist, and are sometimes found native, as, for example, the crystallised silver and mercury compound represented by the formula  $\text{AgHg}_2$ .

In consequence of their strong affinities for the metalloids, the metals are seldom found in a free or uncombined state, even in the inorganic kingdom, and never in animals or plants. The more common metals, in consequence of their strong affinity for oxygen and sulphur, are very rarely met with in the uncombined state; but some of those which are less abundant, such as gold, silver, and platinum, are found uncombined, in which case the terms *native* and *virgin* are applied to them; and other metals, as mercury and copper, occur both in a free and in a combined state. Many native alloys are found, but the ordinary sources of the metals are oxides, sulphides, chlorides, and carbonates, sulphates and other salts. These are termed the *ores* of the metals. The methods of obtaining the metals from their various ores fall under the head of **METALLURGY**.

Various classifications of the metals have been suggested by different chemists. The following is probably one of the most convenient:

I.—The *Light Metals*, subdivided into—

1. The metals of the alkalis—viz., potassium, sodium, cesium, rubidium, lithium.

2. The metals of the alkaline earths—viz., barium, strontium, calcium, magnesium.

3. The metals of the true earths—viz., aluminium, glucinum, zirconium, yttrium, erbium, terbium, thorium, cerium, lanthanum, didymium.

II.—The *Heavy Metals*, subdivided into—

1. Metals whose oxides form powerful bases—viz., iron, manganese, chromium, nickel, cobalt, zinc, cadmium, lead, bismuth, copper, uranium, thallium.

2. Metals whose oxides form weak bases or acids—viz., arsenic, antimony, titanium, tantalum, niobium (or columbium), tungsten, molybdenum, tin, vanadium, osmium.

3. Metals whose oxides are reduced by heat—noble metals—viz., mercury, silver, gold, platinum, palladium, iridium, ruthenium, rhodium, osmium. (Several of the rare metals are here omitted.)

Another classification is that by which the *M.* are arranged in six groups, each group being named after a metal which possesses the common characters in a well-marked degree: viz., (1.) the sodium group; (2.) the calcium; (3.) the iron; (4.) the copper; (5.) the platinum; and (6.) the antimony groups.

**METAMORPHIC ROCKS.** Few of the deposits forming the crust of the earth remain in the condition in which they were deposited. By infiltration of a cement-

ing fluid, by pressure, or by some other indurating agency, sand has become converted into sandstone, and clay and mud into shale. In some strata, this operation has been carried still further. There is a class of rocks, including gneiss, mica-schist, clay-slate, marble, and the like, which, while certainly of aqueous or mechanical origin, have, by intense molecular action, become more or less crystalline. To them, the convenient name Metamorphic (Gr. transformed) Rocks has been given by Lyell.

The Metamorphic Rocks were formerly considered to be the fundamental strata of the earth's crust. The original incandescent mass, it was said, losing its heat by radiation, a solid uneven crust of granite was formed. As soon as the ordinary atmospheric and aqueous agencies began to operate, a disintegration took place, and the abraded materials carried down by the waters, were deposited in the basins which contained the boiling sea. It was thought that this not only accounted for the condition in which the Metamorphic Rocks now exist, but for the remarkable undulations and contortions so characteristic of these strata. Gneiss and the allied crystalline schists were accordingly placed as the lowest sedimentary strata in a division equivalent to the Paleozoic Period, and called the *Azoic*, because they were destitute of organic remains, the conditions in which they were formed being opposed to the existence of animals.

It is now, however, known that Metamorphic Rocks occur as contemporaneous deposits in all epochs of the earth's geological history. In Canada and in the Hebrides, they are of Laurentian age; in the Highlands of Scotland, Cambrian and Silurian; in Devon and Cornwall, Old Red Sandstone and Carboniferous; and in the Alps, Oolitic and Cretaceous, and in some parts even Tertiary. Although deposits of such various ages have been thus altered, the resulting rocks are in structure and composition very similar; their ultimate constituents do not differ from those of ordinary clays and sandstones. In all of them, silica forms the largest proportion, consisting of about 60 to 70 per cent.; alumina follows next, and then other substances in smaller quantities, such as lime, soda, potash, iron, &c. This similarity of composition, and the abundance of clays and sandstones, suggest the supposition that the Metamorphic Rocks may be nothing more than these deposits greatly altered; this is confirmed by many observed instances, in which aqueous strata are continuous with, and gradually change into, Metamorphic Rocks. The granite of Dartmoor has intruded itself into the slate and slaty sandstone, twisting and contorting the strata. Hence some of the slate rocks have become micaceous; others more indurated, having the characters of mica-slate and gneiss; while others, again, appear converted into a hard-zoned rock, strongly impregnated with felspar. In some places in the Eastern Pyrenees, the chalky limestone becomes crystalline and saccharoid as it approaches the granite, and loses all trace of the fossils which it elsewhere contains in abundance. These illustrations tell of changes occurring in the proximity of granite, and it has been consequently somewhat hastily concluded that this rock, coming up in a molten condition from below, has, by the radiation of its heat, produced the metamorphosis. But the observed stratigraphical position of granite, its sometimes passing by insensible degrees into gneiss, and the experiments of Solly and Bryson on its internal structure, shew without doubt that this rock is, at least in many places, an extreme result of metamorphic action, and not the cause of it. To call the energy producing these results metamorphic or molecular action, is simply to hide our ignorance—we get a name, but nothing more. To speak dogmatically on a subject so obscure, is a sign of the same ignorance. The following, however, are the most probable agents that, together or separately, produced these remarkable changes:

1. *Heat*.—From whatever source derived, heat does exist, either distributed universally, or occurring locally in the mass of the earth; and where it exists, thermo-electric influences induce action, which, carried on over immense series of years, might produce in the end great changes. It is generally maintained that granite is the result of crystallisation from perfect fusion, and that the strata converted into gneiss must have been reduced to a state of semi-fusion. But we know of crystallisation taking place in the most compact amorphous solids without any approach to fusion, as in the axes of railway-carriages; and of metamorphic action without semi-fusion, as in the highly indurated bottoms of bakers' ovens, in which the clay is subjected to a long-continued though not a great heat; or in the sandstone floor

of an iron furnace, which, from long contact with the molten iron, loses its color, becomes white and hard, and breaks with a porcelainic fracture, having, indeed, been changed into quartz rock. Besides, the frequent occurrence of cavities in the rock crystals of gneiss containing a fluid which fills them only when the temperature is raised to at least  $94^{\circ}$  F., shews that the crystal could not have been formed at a higher temperature. We are therefore safe in maintaining, that the heat was not in all cases so great as to produce fusion.

2. *Pressure*.—This alone is sufficient to effect the consolidation and induration of aqueous deposits, converting clay or sand into solid stone. When heat is added to pressure, greater activity is likely to be the result. The undulatory movements of the earth's crust, by carrying down to great depths deposits formed on the surface, bring them under the influence of pressure, heat, and thermo-electricity, and at the same time elevate rocks that have been thus acted upon.

It is thought that heated water may be also a powerful agent, especially when it is subjected to great pressure.

These and other agents, then, operating through immense intervals of time, set in motion chemical attraction, whereby the various substances which entered into the composition of the sedimentary deposits rearranged themselves as they are found in the Metamorphic Rocks.

The description of the various Metamorphic Rocks will be found under their different names, viz., GNEISS, QUARTZITE, MICA-SCHIST, CLAY-SLATE, and MARBLE.

**METAMORPHOSIS** (Gr. change of form) denoted, in the mythology of the ancients, those transformations of human beings into beasts, stones, trees, and even into fire, water, &c., in fables of which that mythology abounded. The origin and significance of such fables it is often impossible to determine. Some of them probably originated in observation of the wonderful transformations of nature; some in a misapprehension of the metaphors employed by the older poets; and some, perhaps, in mere superstition and love of the marvellous. The wild imagination of the Orientals filled their mythologies with metamorphoses in the greatest number; and the classic mythology approaches to them in this respect. They were the theme of some of the poets and other Greek authors of the Alexandrine period, and of Ovid among the Latin classics. The medieval literature of Europe, especially of Germany, in its fairy tales and other forms of folk-lore, is also wonderfully rich in metamorphoses.

**METAMORPHOSIS OF ANIMALS.** This term is applied to changes which certain animals undergo after their escape from the envelope of the egg, and which are of such a nature as essentially to alter the general form or the mode of life of the individual.

The most remarkable metamorphoses occur in the Batrachians, Crustaceans, Insects, and Tape-worms, and are briefly noticed in the articles on those classes of animals. For an excellent general account of the metamorphoses of animals, the reader is referred to a series of articles by De Quatrefages in the "*Revue des Deux Mondes*" for 1853.

**METAMORPHOSIS OF ORGANS,** in Botany, a subject of so much importance, that it has been exalted to the rank of a distinct branch of botanical science, under the name of *Morphology* or *Vegetable Morphology*. Attention to it is essential to a philosophical study of botany; yet it may almost be said that nothing was known either of its facts or its laws, till the poet Goethe proclaimed them to the world in his treatise entitled "*Die Metamorphose der Pflanzen*," in 1790. Linnæus had, indeed, called attention to the development of organs, and the changes which they undergo, and had made this the subject of a "thesis" entitled "*Prolepsis Plantarum*" in 1760; but, in a manner very unusual with him, he mixed up with his observations and philosophical speculations certain fanciful suppositions, the falsehood of which soon becoming apparent, caused all the rest to be neglected. Wolff afterwards extricated the true from the fanciful in the views of Linnæus, and gave them greater completeness; but he introduced the subject only incidentally in a paper on comparative anatomy, which failed to attract the attention of botanists, and probably had never been seen by Goethe, whose discovery, apparently altogether original, is one of the finest instances on record of acute observation combined with philosophical generalisation.

Metamorphosis  
Metayer

16

The metamorphosis of organs is noticed in the articles on particular organs. It is only necessary here to make a very general statement of its facts and laws. A plant is composed of the *axis* and its *appendages*; the axis appearing above ground as the stem and branches, below ground as the root; the appendages being entirely above ground, and essentially *leaves*; all organs which are not formed of the axis being modified leaves. The proof of this consists very much in the gradual transition of one organ into another, manifest in some plants, although not in others; as of leaves into bracts, one of the most frequently gradual transitions; of leaves into sepals, as seen in the leaf-like sepals of many roses; of sepals into petals, as seen in the petal-like sepals of lilies, crocuses, &c.; of petals into stamens, as seen in water-lilies; and even of stamens into pistils, often exemplified in the common house-leek. The proof is confirmed and completed by observation of the monstrosities which occur in plants, particularly in the frequent return of some part of the flower to its original type, the leaf, and in the conversion of one part of the flower into another, which is often the result of cultivation, and is particularly illustrated in *double* flowers, the increase of the number of petals being the result of the conversion of stamens into petals.

A flower-bud being a modified leaf-bud (see *BUD*), and a flower therefore the development of a modified leaf-bud, the parts of a flower correspond in their arrangement with the leaves on a branch. But peculiar laws govern the development of organs in each species of plant. Thus, the leaves in one are opposite; in another, alternate; in another, whorled; all depending on the law which governs the growth of the axis in relation to the development of leaves, which is very constant in each species; and in like manner the parts of the flower are developed in whorls around an abbreviated terminal portion of the axis, the energies of the plant being here directed to the reproduction of the species, and not to the increase or growth of the individual. The fruit itself, being formed from the pistil, is to be regarded as formed of modified leaves. Goethe truly says: "The pod is a leaf which is folded up and grown together at its edges, and the capsule consists of several leaves grown together; and the compound fruit is composed of several leaves united round a common centre, their sides being opened so as to form a communication between them, and their edges adhering together."

The metamorphosis of organs has been investigated with great diligence and success, and beautifully elucidated by Miquel, Lindley, Schleiden, and other botanists.

#### METAMORPHOSIS OF TISSUE. See *TISSUE*.

**METAPHOR** (Gr. *metaphora*, a transference), a figure of speech, by means of which one thing is put for another which it only resembles. Thus, the Psalmist speaks of God's law as being "a light to his feet and a lamp to his path." The metaphor is therefore a kind of comparison, in which the speaker or writer, casting aside the circumlocution of the ordinary similitude, seeks to attain his end at once, by boldly identifying his illustration with the thing illustrated. It is thus of necessity, when well conceived and expressed, graphic and striking in the highest degree, and has been a favorite figure with poets and orators, and the makers of proverbs, in all ages. Even in ordinary language the meanings of words are in great part metaphors; as when we speak of an *acute* intellect, or a *bold* promontory.

**METAPHYSICS**, a word of uncertain origin, but first applied to a certain group of the philosophical dissertations of Aristotle (see *ARISTOTLE*). As since employed, it has had various significations, and more especially two—a larger and a more confined. In the more confined sense, it is allied to the problems of the Aristotelian treatise, and is concerned with the ultimate foundations of our knowledge of existing things. What is the nature of our knowledge of the external world, seeing that mind cannot properly know what is not in contact with itself? has been asked by philosophers, and answered in various ways; and this is the great question of metaphysics (see *PERCEPTION*, *COMMON SENSE*). The name "Ontology" has been applied to the same inquiries into our cognizance of existences out of ourselves. But as the solution of this difficult question was found to involve an investigation into the nature of the human mind, it became allied with the science whose object it is to describe fully and systematically the laws and properties of our mental constitution—a science called by the various names of Psychology, Mental Philos-

ophy, Moral Philosophy; and hence Metaphysics came to be an additional name for this more comprehensive department. The word is employed at the present day by writers of repute in both meanings. Thus, Ferrier's "Institutes of Metaphysic" is occupied solely with the questions connected with knowledge, or the nature of our perception of an external world; his explanatory title is, "The Theory of Knowing and Being." On the other hand, Mansel's Metaphysics is divided into two parts—Psychology, or the science of the facts of consciousness, which expresses the science of mind generally; and Ontology, or the science of the same facts considered in their relation to realities existing without the mind—that is, the problem of Perception, or Metaphysics in the narrower sense.

METASTASIO (originally Trapassi), Pietro, one of Italy's most admired poets, was born at Rome in 1698, of humble parents, and gave early evidence of his genius by his boyish improvisations. M. having attracted the casual notice of Gravina, a famous juriconsult of the day, the latter undertook the entire education and career of the youth, whose paternal name of Trapassi became thenceforward Gleesied into Metastasio, both words being identical in signification. The young poet speedily advanced in classical and general knowledge; and to his patron's enthusiastic devotion to the Greek drama, may doubtless be traced much of the after-bent of M.'s own poetical tastes. By the early death of Gravina, M. was placed in possession of considerable property. In 1724, he published one of his most celebrated dramas, "La Didone," which, with "Il Catone" and "Il Siroe," conferred on the poet a European name. In 1780, M. accepted the post of poet-laureate to the Imperial court of Vienna. During his sojourn in Vienna, M. composed his "Giuseppe Riconosciuto," "Il Demofonte," and the "Olimpiade." He died at Vienna in 1782. M. was distinguished for the generosity, integrity, and candor of his nature, the sincerity of his friendships, and the disinterested warmth of his sentiments. His works are innumerable, embracing 68 dramas, 48 cantatas, besides a vast number of elegies, canonette, sonnets, and translations. They enjoy unexampled popularity among all grades of his countrymen; in their pure classical subjects and forms, the educated student finds instruction and delight; while their facile musical grace and verbal simplicity adapt them to the popular appreciation of the artless beauties of poetry. The best editions of M. are those of Turin (1757, 14 vols.); Paris (1755, 12 vols.); Paris (1780, 12 vols., large 8vo); Genoa (1802, 6 thick vols.); Mantua (1816—1820, 20 vols.).

METAYER (Ital. *metà*, Fr. *moitié*, half), in French, is the cultivator of a *metairie*, or farm, the tenant of which gives the landlord a portion of the produce as his rent. In some of the older French dictionaries, such as that of Trevoux, the word is said to apply to any kind of farmer, but in the oldest dictionary of French and English, Cotgrave's, the word is thus interpreted: "Properly one that takes ground, to the halves, or binds himself by contract to answer unto him of whom he holds them half, or a great part of the profits thereof." The term has lately got a meaning in political economy on account of some eminent writers having raised the question, whether this arrangement between landlord and tenant is not so much more advantageous than any other, both to the parties immediately concerned, and to the public at large, that it ought to be specially encouraged. Sismondi appears to have been the first to open this wide view of the influence of the practice, and he has given a chapter to its consideration in his Political Economy (b. iii. chap. 5). He says what cannot be denied, that such an arrangement was a great improvement on mere serfdom, which gave the cultivator no interest in the produce of his industry. But in giving the reasons for his admiration of the system as one which provides in the general case for the wants of the peasant while relieving him of all anxiety about markets and prices, he admits that a metayer peasantry never advance beyond the humble, happy, and contented lot which immediately falls to them. It is a system, therefore, inconsistent with the application of large capital to cultivation, and consequently with the extraction of the highest value which the soil can yield. A tenant will hesitate to lay £50 worth of guano on his fields if half the additional crop it will bring goes to his landlord. To those who maintain that the moral effect of the system is beneficial, this will be no argument against it, but to the political economist it is an argument against the practicability of the system in a rich money-making agricultural country. Where there is an enterprising peasantry without capital it is a valuable resource; a great portion of the valuable agricultural dis-

tracts of Scotland were thus brought into cultivation by improvers whose rent was a portion of the crop. But while these very districts in a great measure owe their present prosperity, and the existence of a set of capitalist-farmers to such a system of cultivation pursued with more energy than M. Sismondi considers natural to it, there is no doubt that the substitution of such an arrangement for money-rent would now be a very serious waste.

**METELLUS**, the name of a Roman family of the plebeian gens Cæcilia, which rose to be one of the first families of the Roman nobility.—One of the most distinguished members of the family was **QUINTUS CÆCILIUS M. MACEDONICUS**, who received his surname from his victory over Andriscus, an aspirant to the throne of Macedonia (148 B.C.). His life was considered by ancient writers an example of the greatest felicity. He died 118 B.C.—Another was **QUINTUS CÆCILIUS M. NUMIDIUS**, who twice defeated Jugurtha in Numidia (109 B.C.), and was celebrated for his integrity of character, but was superseded in his command by Marins. His son, **QUINTUS CÆCILIUS M.**, surnamed *Pius*, joined Sulla in 83 B.C., but sought to moderate the severity of his proscriptions. He, too, bore a distinguished character for virtue.—**QUINTUS CÆCILIUS M. CRÆTICUS** conquered Crete, and reduced it to a Roman province (67 B.C.).—**QUINTUS CÆCILIUS M. PIUS SCIPIO**, sometimes called **QUINTUS SCIPIO**, and sometimes **SCIPIO M.**, was a son of Publius Cornelius Scipio, who was adopted by one of the Metelli, and became the father-in-law of Pompey, and his zealous partisan. He commanded under him at Pharsalus, maintained war on his behalf for some time in Africa; and after the battle of Thapsus (46 B.C.), died by his own hand.

**METEMPSYCHOSIS.** See **TRANSMIGRATION OF SOULS.**

**METEOROLOGY** (Gr. *metēōra*, meteors, or atmospheric phenomena) was originally applied to the consideration of all appearances in the sky, both astronomical and atmospheric; but the term is now confined to that department of natural philosophy which treats of the phenomena of the atmosphere as regards weather and climate. The leading points of this wide subject will be found under such heads as **AEROLITES, ATMOSPHERE, BAROMETER, BOILING, CLOUDS, DEW, ELECTRICITY, EVAPORATION, FOG, HAILSTONES, HALOS, HOAR-FROST, LIGHTNING, MAGNETISM, RAIN, SNOW, STORMS, &c.** We confine ourselves here to a historical sketch of the science.

Owing to the complexity of the phenomena, meteorology is the most difficult and involved of the sciences, and seems, indeed, at first sight, almost incapable of being reduced to a science at all. On this account, the only procedure admissible in the first place is long and patient observation, and a faithful recording of facts.

From the nature of the subjects which make up the science, it may be inferred that they occupied men's minds from a remote antiquity. The splendid and ever-varying panorama of the sky, and the changes of temperature through the days and the seasons, with all the other elements constituting the weather, and thus powerfully affecting the necessities and comfort of man, are of a nature well fitted to arrest his attention. From the time spent in the open air in the early ages, and from the imperfect protection afforded against the inclemency of the seasons, those appearances which experience proved to precede a change of weather would be eagerly recorded and handed down. In this way, many most valuable facts were ascertained and passed current from hand to hand; and, perhaps, there is no science of which more of the leading facts and inferences have been from so early a period incorporated into popular language.

Aristotle was the first who collected, in his work "On Meteors," the current prognostics of the weather. Some of these were derived from the Egyptians, who had studied the science as a branch of astronomy, while a considerable number were the result of his own observation, and bear the mark of his singularly acute and reflective mind. The next writer who took up the subject was Theophrastus, one of Aristotle's pupils, who classified the opinions commonly received regarding the weather under four heads, viz., the prognostics of rain, of wind, of storm, and of fine weather. The subject was discussed purely in its popular and practical bearings, and no attempt was made to explain phenomena whose occurrence appeared so irregular and capricious. Cicero, Virgil, and a few other writers also wrote on the subject without making any substantial accessions to our knowledge; indeed the treatise of

Theophrastus contains nearly all that was known down to comparatively recent times. Partial explanations were attempted by Aristotle and Lucretius, but as they wanted the elements necessary for such an inquiry, being all but totally ignorant of every department of physical science, their explanations were necessarily vague, and often ridiculous and absurd.

In this dormant condition, meteorology remained for ages, and no progress was made till proper instruments were invented for making real observations with regard to the temperature, the pressure, the humidity, and the electricity of the air. The discovery of the weight or pressure of the atmosphere made by Torricelli in 1643, was undoubtedly the first step in the progress of meteorology to the rank of a science. This memorable discovery disclosed what was passing in the more elevated regions of the atmosphere, and thus the elevations and depressions of the barometric column largely extended our knowledge of this subtle element. See **BAROMETER**.

The invention and gradual perfecting of the Thermometer (q. v.) in the same century, formed another capital step; as without it, nothing could be known, beyond vague impressions, regarding temperature, the most important of all the elements of climate. This great invention soon bore excellent fruit. Fahrenheit constructed small and portable thermometers, which, being carried by medical men and travellers over every part of the world, furnished observations of the most valuable description—the comparative temperature of different countries became known, and the exaggerated accounts of travellers with regard to extreme heat and cold were reduced to their proper meaning. Scarcely less important was the introduction of the Hygrometer (q. v.), first systematically used by De Saussure (died 1799), and afterwards improved by Dalton, Daniell, and August. From the period of the invention of these instruments, the number of meteorological observers greatly increased, and a large body of well-authenticated facts of the utmost value was collected. The climates of particular parts of the earth were determined, and the science made great and rapid advances by the investigations undertaken by distinguished philosophers into the laws which regulate the changes of the atmospheric phenomena.

The theory of the trade-winds was first propounded by George Hadley in the "Philosophical Transactions" for 1735; and it may be mentioned as a remarkable fact, that, for about half a century, it remained quite unnoticed, when it was independently arrived at by Dalton, and published in his essays.

The publication of Dalton's Meteorological Essays, in 1798, marks an epoch in meteorology. It is the first instance of the principles of philosophy being brought to bear on the explanation of the intricate phenomena of the atmosphere. The idea that vapor is an independent elastic fluid, and that all elastic fluids, whether alone or mixed, exist independently; the great principles of motion of the atmosphere; the theory of winds, their effect on the barometer, and their relation to temperature and rain; observations on the height of clouds, on thunder, and on meteors; and the relations of magnetism and the aurora borealis—are some of the important questions discussed in these remarkable essays, with an acuteness, a fullness, and a breadth of view that leave little to be desired.

One of the most interesting and fruitful subjects of inquiry that engaged the attention of meteorologists was dew. The observations on this subject were first collected and reduced to a perfect theory by Dr Wells. See **Dew**.

In 1828, Daniell published his "Meteorological Essays and Observations," which, while adding largely to our knowledge in almost every department of the subject, are chiefly valuable as bearing on the hygrometry of the atmosphere. Though the practical advantages which he anticipated would flow from it have not been realised, yet this difficult and still obscure department of meteorology stands indebted to him more than to any other philosopher. The law of the diffusion of vapor through the air, its influence on the barometric pressure, and its relations to the other constituents of the atmosphere, are among the least satisfactorily determined questions in meteorology. Since this element is so important as an indicator of storms and other changes of the weather, and since so much remains still to be achieved, it is to be hoped that it will soon be more thoroughly investigated. A most important addition has lately been made to our knowledge of the vapor of the atmosphere by Professor Tyndall, in his experiments on radiant heat, especially as regards the gases. The vapor of water is there shewn to exert extraordinary energy as a radiant and absorbent of heat; and hence the vapor dissolved in the air acts the part of a covering or

protection to the earth. As it is, to some extent, impervious to solar and terrestrial radiation, it follows that if the air were quite drained of its moisture, the extremes of heat and cold would be so intense and insufferable, that all life would instantly perish, there being no screen shielding the earth from the scorching glare of the sun by day, and from the equally scorching and blighting effects of its own radiation by night. It is to be expected that this great discovery will soon throw light on many questions of meteorology.

Electrical observations have been, of all meteorological observations, perhaps the least productive, partly owing to their scantiness, from the expense and trouble attending them, and partly, no doubt, to the free and bad use made of the name of electricity by crude theorists in explaining phenomena of which it would have been wiser to have confessed their ignorance. But the brilliant discoveries which have recently been made on the mutual relations of heat, motion, electricity, magnetism, and the other forces of matter, lead us to indulge the hope that the application of these results to meteorology will be attended with discoveries equally brilliant and important. Humboldt's treatise on "Isothermal Lines" (1817) constitutes a notable epoch in experimental meteorology. Dove has since continued the investigation, and in his splendid work, "On the Distribution of Heat on the Surface of the Globe," has given charts of the world, shewing the temperature for each month, and for the year, and also charts of abnormal temperatures. It is scarcely possible to overestimate the value of this work, for though, to a considerable extent, the lines are hypothetical, there can be no doubt that a close approximation to the march of mean temperature and its distribution over the earth through the year, has been arrived at. The idea has been carried out with greater fullness of detail by the United States' government in the beautiful and elaborate series of charts of temperature and rainfall given in the "Army Meteorological Register" for 1855. In these charts, the temperature and rainfall in the different seasons for every part of the United States, deduced from accurate observations, may be seen at a glance. Buchan has published isothermals for the British Isles, Mohn for Norway, and Blandford for Hindustan; and isothermals for the sea have been published by the Admiralty.

The establishment of meteorological societies during the last twenty years must also be commemorated as contributing in a high degree to the solid advancement of the science which, more than any other, must depend on extensive and carefully conducted observation. In this respect, the United States stand pre-eminent, the observers there numbering nearly 800. Great Britain is also well represented in the English and Scottish societies, which together number above 200 observers. In France, Germany, Russia, &c., the science is also being widely cultivated. Owing to the disastrous flooding of the Rhone, an inquiry has been carried on for several years, having for its object the determination of those causes which affect the rainfall in the basins of the Rhone and Saône. Observers in Germany and Great Britain have been secured to co-operate with the French observers, and under the management of a commission, it may be expected that important conclusions respecting the rainfall and the progress of storms will be arrived at, and means devised to avert the calamity of these great floods, by timely warning being given of their approach.

A special object of meteorological societies is to ascertain the degrees of heat, cold, and moisture in various localities, and the usual periods of their occurrence, together with their effects on the health of the people, and upon the different agricultural productions; and by searching into the laws by which the growth of such products is regulated, the agriculturalist may be enabled to judge with some degree of certainty whether any given article can be profitably cultivated.

But perhaps none of the arts have benefited to so large an extent by the labors of meteorologists as navigation. The knowledge thus acquired of the prevailing winds over the different parts of the earth during the different seasons of the year—and the regions of storms and calms—and the laws of storms, have both saved innumerable lives, and by pointing out the most expeditious routes to be followed, shortened voyages to a remarkable degree. In connection with this, the name of Captain Maury (q. v.) deserves special commendation for the signal service he has rendered to navigation.

Another fruit of the multiplication of meteorological stations is the prediction of storms and "forecasts" of the weather, which have been carried on in the United States, and commenced with ability and success by Admiral Fitzroy in England.

These "forecasts" are based on telegrams which are received every morning from above forty selected stations in Great Britain and Ireland, and on the continent, from Haparanda as far south as Lisbon. These telegrams give the exact state of the barometer, thermometer, hygrometer, and rain-gauge, with the direction and force of the wind, and appearance of the sky at each of these forty stations at eight in the morning. In the event of there being any storm or other atmospheric disturbance at one or more of these places, a full and accurate description of it is thus conveyed to London; and it is thence the duty of the officials there to consider the direction in which the storm is moving, so as to enable them to give warning of its approach by special signals. But in addition to warnings of storms, Fitzroy also issued daily "forecasts" of the weather likely to occur in the different districts of Great Britain for the following two days, and which were in like manner founded on the state of the atmosphere at distant points, keeping in view the atmospheric currents known generally to prevail at that particular time of the year. As the cost of this system was about £2000 annually, a severe test was applied, at the instance of the Treasury, from July 1861 to June 1862, for the purpose of ascertaining whether the expenditure was justified by the success attending it. During the first six months, 413 signals were hoisted, and in 214 cases a storm occurred where a warning was given. It must not be inferred that in the remaining 199 cases there was no storm anywhere; all that was meant was, that no storm occurred at the places where the signal was given; but a storm may have occurred, and probably did occur, in some other part of the country. Now that the system has been longer in use, the signals are given from a better knowledge of the movements of the atmosphere, so that if the test were again applied, the number of failures would be found to be much fewer. Since the barometric depression is in almost all cases spread over a wider area than the storm which accompanies it, and since the storm occasionally passes into the upper regions of the atmosphere, so as to be less felt on the earth's surface at that place, it is obvious that a considerable time must yet elapse before a sufficiently intimate knowledge of the movements of the air be acquired in order to indicate with certainty the particular places where the storm will break out, and where it will not. The problem to be practically worked out is this: Given the telegrams from the stations showing the exact meteorological conditions prevailing over the included area, with indications of a storm approaching in a certain direction, to determine, not the probable area over which the tempest will sweep, but the precise localities which will altogether escape, the places where the storm will rage, and the places where it will not touch the earth, but pass innocuously into the upper regions of the atmosphere: its continuance, its violence, and the particular directions from which the wind will blow at the places visited by the storm while it lasts. Considerable progress has already been made towards the solution of this difficult problem; and if a complete solution be impossible, such an approximation to a solution will doubtless be arrived at as will render it foolhardy to disregard the warnings given.

But these predictions only extend to a few days. Does the present state of the science afford any grounds to hope that prediction for longer periods will yet be attained? Weather-registers extending over long periods give no countenance whatever to the notion, that there are regularly recurring cycles of weather on which prediction may be based. Further, the manner in which good and bad seasons occur in different places with respect to each other, shews clearly that they have little direct immediate dependence on any of the heavenly bodies, but that they depend directly on terrestrial causes. Thus, while the summer of 1861 was almost unprecedentedly wet and cold in Scotland, the same summer was hot and dry to a degree equally unprecedented on the continent of Europe, and particularly in Italy; and such examples may be multiplied almost *ad infinitum*.

The assumption that the equatorial and polar currents of wind at any locality may ultimately balance each other, would appear, from recent observation, to give some ground for prediction extending over considerable intervals. Thus, a wet summer was predicted for Britain in 1862, from the circumstance of a most unusual prevalence of east winds in the spring of that year. An almost incessant continuance of south-west winds followed, which discharged themselves in deluges of rain, clouded skies, and a consequent low temperature. As these south-west winds prevailed till the spring of 1863, less south-west wind was looked for during the sum-

mer, which was thus expected to be fine and warm—a prediction which was realised. This prediction holds in about three cases out of four.

The following are a few standard works on Meteorology, in addition to those already referred to: L. F. Kämtz's "Meteorology," translated from the German (Lond. 1845); Dr Ernst Erhard Schmidt's "Lehrbuch der Meteorologie" (Leipz. 1860); Professor Eddy's "Fourth Report on Meteorology," (Washington, 1867); Drew's "Meteorology," a useful handbook (Lond. 2d ed. 1860); Hertel's "Meteorology" (1861); D. P. Thomson's "Introduction to Meteorology" (1849); Buchan's "Handy Book to Meteorology" (1868); Loomis, "Treatise on Meteorology" (1868).

**METEORS.** The whole subject of meteors was treated in the body of the work under the head of **ÆROLITES**. The subject, however, has since occupied a great deal of attention, and there is at present a tendency on the part of astronomers and physicists to separate that class of meteors known as "shooting-stars" from the group of *meteorolites* (which includes *aëro-siderites*, or masses of meteoric iron; *siderolites*, which are conglomerates of iron and stone; and *ærolites*, which are wholly of stone), on the grounds, that the most prominent appearances of the former are *periodic*, while the latter seem to occur at irregular intervals, and that the former have hitherto not been *proved* to leave any traces of their visit on the earth's surface. We are, however, hardly as yet in a position to decide as to the similarity or dissimilarity of the two classes of bodies.

Popular interest has been largely aroused respecting "shooting-stars," by reason of the brilliant display of them which took place on the night of November 13, 1866. This "star-shower," the grandest that has ever been observed in Britain, was confidently predicted, from the occurrence of a similar shower at the corresponding date 1799, 1833, and 1834; and the extremely favorable state of the atmosphere rewarded those who were on the watch with a complete view of one of nature's most magnificent displays. The shower commenced about 11½ P.M., with the appearance at brief intervals of single meteors; then they came in twos and threes, steadily and rapidly increasing in number till 1h. 13m. A.M. on November 14, when no fewer than 57 appeared in one minute. From this time, the intensity of the shower diminished gradually, wholly ceasing about 4 A.M. The total number of meteors which at that time came within the limits of the earth's atmosphere was estimated at about 940,000, and the number seen at each of the several observatories in Britain averaged 6000. This star-shower, like those of 1833 and 1834, seemed to proceed from the region of the heavens marked by the stars and in the constellation Leo; and it has been shewn by astronomers that this was the point towards which the earth in her orbit was moving at the time; consequently, she had either overtaken the meteoric shower, or had "met" it proceeding in a contrary direction. The meteors on that occasion presented the usual variety of color, size, and duration; the great majority were white, with a bluish or yellowish tinge; a considerable number were red and orange; and a few were blue; many surpassed the fixed stars in lustre, and some were even brighter than Venus (the most brilliant planet as seen from the earth) at her maximum. Most of the meteors left trains of vivid green light 5°–15° in length, which marked their course through the heavens, and endured for 3" on an average, then becoming dissipated; though some of the trains were almost 40° in length, and remained in sight for several minutes. Professor Airy observed that the direction of the meteors' flight was little influenced by the earth's attraction.

On the morning of November 14, 1867, a star-shower equal in magnitude to that of 1866 was observed in France and America, but was almost wholly invisible in Britain, on account of the cloudy state of the atmosphere.

The brilliant display of 1866 gave a vigorous impulse to the astronomical investigation of shooting stars, and it is now generally agreed that the November meteors move in an orbit round the sun, inclined at about 7° to that of the earth, and that, in all probability, this orbit forms a ring or belt of innumerable small fragments of matter, distributed with very variable density of grouping along it, thus corresponding so far to the Planetoid (q. v.) group between Mars and Jupiter. It is also agreed that the motion of this meteor ring round the sun is retrograde; that the earth's orbit at that point where she is situated on November 13–14, intersects this ring; and that, probably, in 1799, 1833–1834, and 1866–1867, it is the same group of meteors which has been observed; and the last-mentioned hypothesis has

been made the foundation of a calculation of the probable orbit and periodic time of this meteor-ring. The fact that a November star-shower generally occurs for two years in succession, and then recurs at an interval of 82 or 83 years, seems to indicate that though the earth may pass through the meteor-orbit every year, the meteors are so grouped at intervals along the ring, and their periodic time differs so much from that of the earth, that it requires 82—83 years before this accumulating difference amounts to a complete revolution of either the earth or the ring, and a repetition of the star-shower becomes possible.

Professor Newton of Yale College, America, who entered into an elaborate investigation of the subject, concluded that the 5 possible periodic times (the earth's being taken as unity) of the meteor-ring were  $2+1-83-25$ ,  $1+1-83-26$ , and  $1-83-26$ , and that of these, the fourth,  $1-1-83-25$ , or 854.62 days, is the actual period of its revolution round the sun, and that, consequently, it has described 84 revolutions while the earth has described 83, the cycle of 84 meteor revolutions differing from 83 years by only 3.17 days; and in accordance with this estimate, he calculated its orbit and the approximate extent (seeing the meteor shower generally occurs in two successive years) of the meteor-group which produces the November showers. His conclusions have, however, been vigorously opposed by other eminent astronomers, such as Professor Adams (q. v.) and Mr Alexander Herschel, both of whom hold that the first four of the possible periods given by Professor Newton are *impossible*, and that the last,  $1-83-25$  (i. e., that the meteor-ring makes  $1-83-25$  of a solar revolution in a year, and one complete revolution round the sun in 83.5 years), is the correct estimate. If this view be correct, the meteor-group must be so much extended along its ring or orbit as to take more than a year to cross the earth's orbit, and a long time must necessarily elapse before a fair estimate of this extent can be obtained. A periodic time of  $83\frac{1}{2}$  years, and an orbit which at the same time approaches so near the sun as to intersect that of the earth, indicate a path of great ellipticity, akin to those of the comets; and the idea of the cometary nature of these meteors derives support from two remarkable facts, the one discovered by Schiaparelli of Milan, that this assumed orbit coincides very nearly with that of the great comet of 1862 (Professor Adams connects this comet with the August meteor), and the other by C. F. W. Peters of Altona, that it coincides with that of Temple's comet.

Mr Alexander Herschel also maintains that the meteors are of recent origin, probably fragments from some of the great luminous bodies, and that though at present assembled in a comparatively dense group, the difference of their relative velocities will have the effect of gradually distributing them all over the meteoric ring, when a November shower will occur every year. Mr Herschel also carefully observed 20 meteors with the view of calculating their weight, from the rate of their motion and the amount of heat (as shewn by their brightness) evolved in the destruction of their velocity, by the resistance of the atmosphere, and found their weight to vary from 80 grains to  $7\frac{1}{2}$  lbs.

The cause of the luminosity of meteors was long a point in dispute, the two chief suppositions being, that the resistance of the atmosphere to a body dashing through it at about 80 miles per second, generated so much heat as to produce ignition; while the other was the action of terrestrial magnetism. The point most strongly urged against the first supposition, by the supporters of the second, was, that the height at which meteors were occasionally seen rendered any action of the atmosphere impossible; but as this objection was founded on the purely hypothetical opinion that the atmosphere did not extend more than about 50 miles from the earth's surface, it was not very cogent. This problem was handled by Sir John Herschel in an able paper published in the "Edinburgh Review" (January 1849), in which he clearly shewed that the very high latent heat of the air in the higher and rarer parts of the atmosphere, would be sufficient to cause an enormous development of heat in the event of the air being compressed before a body advancing into it with a "planetary" velocity. This opinion is now held by almost all eminent men of science. The enormous heat to which the meteor is thus subject, produces incandescence, after which, with more or less facility, according to the nature of the materials of which the meteor is composed, the outer portion becomes liquid, and, by the powerful resistance of the air to the meteor's rapid course, is thrown off in a long stream, forming the tail, which, after rapidly losing its velocity, is precipitated to the earth as a fine

dust like volcanic ash; while the meteor thus rapidly and constantly diminishing as it flies along in its headlong course, either becomes wholly dissipated into "tail," falls to the earth, or makes its way out beyond the limits of the earth's atmosphere, and continues its course. This supposition of exclusive atmospheric agency also gives a plausible explanation of the phenomenon of meteors "bursting," this being caused by the sudden heating and consequent expansion of the outer part, while the interior was still in the state of intense cold acquired while in interplanetary space.

While astronomers physicists in general have been thus trying to reduce the phenomena of meteors to a system, their chemical brethren have not been idle. Public collections of meteoric bodies have been made at Vienna, the British Museum, Paris, Berlin; and private ones by Mr Greg of Manchester, Baron Reichenbach in Austria, and Professor Shepard in America; and opportunities have thus been afforded of determining the nature of their composition.

**METHODISTS**, the name originally given, about the year 1729, by a student of Christ-Church to the brothers Wesley, and several other young men of a serious turn of mind, then members of different colleges of Oxford, who used to assemble together on particular nights of the week chiefly for religious conversation. The term was selected, it is believed, in allusion to the exact and *methodical* manner in which they performed the various engagements which a sense of Christian duty induced them to undertake, such as meeting together for the purpose of studying Scripture, visiting the poor, and prisoners in Oxford jail, at *regular* intervals. Subsequently, it came to be applied to the followers of Wesley and his coadjutors, when these had acquired the magnitude of a new sect; and though their founder himself wished that "the very name," to use his own words, "might never be mentioned more, but be buried in eternal oblivion," yet it has finally come to be accepted by most, if not all of the various denominations who trace their origin mediately or immediately to the great religious movement commenced by John Wesley. For an account of the origin and earlier development of Methodism, see articles on the brothers **WESLEY** and **WHITEFIELD**. We confine ourselves here to a brief notice of its organisation, doctrine, and present condition.

1. *Organisation*.—This appears to have been partly improvised by Wesley to suit the exigencies of his position. It was not a theoretical and premeditated, but a practical and *extempore* system. In the "Rules of the Society of the People called Methodists" drawn up by himself, he says: "In the latter end of the year 1739, eight or ten persons came to me in London, who appeared to be deeply convinced of sin, and earnestly groaning for redemption. They desired (as did two or three more the next day) that I would spend some time with them in prayer, and advise them how to flee from the wrath to come, which they saw continually hanging over their heads. That we might have more time for this great work, I appointed a day when they might all come together, which, from thenceforward they did every week, viz., on Thursday in the evening." This he calls "the first Methodist Society." Its numbers rapidly increased, and similar "societies" were soon formed in different parts of England, where the evangelistic labors of the Wesleys had awakened in many minds "a desire to flee from the wrath to come, and be saved from their sins"—the only condition, we may remark, required of any for admission into these societies. In order to ascertain more minutely how the work of salvation was progressing in individual cases, Wesley subdivided the societies into "classes," according to their respective places or abode, each class containing about a dozen persons, under the superintendence of a "leader," whose duties are partly religious and partly financial. 1. He has to see each person in his class once a week, "to inquire how their souls prosper, and to encourage, comfort, or censure, as the case may require. 2. To collect the voluntary contributions of his class, and pay it over to the "stewards" of the society, and to give the ministers all necessary information regarding the spiritual or bodily condition of those under his leadership. For preaching purposes, on the other hand, the societies were aggregated—a certain number of them constituting what is called a circuit. This now generally includes a town, and a rural circle of ten or fifteen miles. To each circuit, two, three, or four ministers are appointed, one of whom is styled the "superintendent;" and here they labor for at least one year, and not more than three. Every quarter, the classes are visited by the ministers, who make it a point to converse personally with every member; at the termination of which pro-

ceeding, a "circuit-meeting" is held, composed of ministers, stewards, leaders of classes, lay-preachers, &c. The stewards (who are taken from the societies) deliver their collections to a circuit-steward, and the financial business of the body is here publicly settled. At this quarterly meeting, candidates for the office of the ministry are proposed by the president, and the nomination is approved or rejected by the members. Still larger associations are the "districts," composed of from ten to twenty circuits, the ministers of which meet once a year, under the presidency of one of their number, for the following purposes: 1. To examine candidates for the ministry, and to try "cases" of immorality, heresy, insubordination, or inefficiency on the part of the clergy. 2. To decide preliminary questions concerning the building of chapels. 3. To investigate and determine the claims of the poorer circuits to assistance from the general funds of the body. 4. To elect a representative to the committee of Conference, whose duty is to nominate ministers for the different stations for the ensuing year—their appointments, however, being subject to the revision of Conference. In all the financial and other purely *secular* business of the districts, laymen (such as circuit-stewards and others) deliberate and vote equally with the clergy. The supreme Methodist assembly is the "Conference." The first was held in 1744, when John Wesley met his brother Charles, two or three other clergymen, and a few of the "preachers"—men whom his zeal and fervor had induced to abandon their secular employments, and devote themselves to declaring the message of the Gospel. The purpose for which he called them together was, he says, "for the sake of conversing on the affairs of the 'societies' . . . . and the result of our consultations we set down to be the rule of our future practice." In the course of his life, Wesley presided at forty-seven of these annual assemblies. The Conference now consists of 100 ministers, mostly seniors, who hold their office according to arrangements prescribed in a Deed of Declaration, executed by John Wesley himself, and enrolled in Chancery. But the representatives previously mentioned, and all the ministers allowed by the district committees to attend—who may or may not be members of the legal Conference—sit and vote usually as one body, the 100 confirming their decisions. In this assembly, which is exclusively clerical, every minister's character is subjected to renewed and strict scrutiny, and if any charge be proved against him, he is dealt with accordingly; candidates for the ministry are examined both publicly and privately, and set apart to their sacred office; the entire proceedings of the inferior courts (if we may so call them) are finally reviewed; and the condition, requirements, and prospects of the body are duly considered.

2. *Doctrine and Worship.*—Under this head, not much requires to be said. Wesleyan Methodists claimed to be considered *orthodox*, *Protestant*, and *evangelical*. The propriety of the last two appellations will probably not be disputed, but a rigid Calvinist might object to the first. They accept the *articles* of the English Church, but believing these articles to have been framed on a basis of *comprehension*, they consider themselves at liberty to accept them in an Arminian sense. It must not, however, be supposed that they are out-and-out Arminians. Their great distinguishing doctrine is the universality and freedom of the atonement; hence they reject the Calvinistic doctrine of predestination (which they conceived to be incompatible with the former), but while they maintain the freedom of the will and the responsibility of man, they also maintain his total fall in Adam, and his utter inability to recover himself. If these two appear to the human understanding to conflict, it is nevertheless asserted that the Bible teaches both; and it is objected to high Calvinism, that in its anxiety to be logical, it has shewn itself unscriptural. Prominence is also given by the Wesleyan M. to certain points of religion, some of which are not altogether peculiar to them. They insist on the necessity of men who profess to be Christians feeling a *personal interest* in the blessings of salvation—i. e., the assurance of forgiveness of sins and adoption into the family of God. This, however, is not to be confounded with a certainty of *final salvation*. They believe the Spirit of God gives no assurance to any man of that, but only of *present pardon*. In harmony with this view, they reject the doctrine of the necessary perseverance of the saints, and hold that it is fearfully possible to fall from a state of grace, and even to perish at last after having "tasted of the heavenly gift," and having been "made partakers of the Holy Ghost." They also maintain the perfectibility of Christians,

or rather the possibility of their entire sanctification as a privilege to be enjoyed in this life. But Wesley "explains" that "Christian perfection does not imply an exemption from ignorance or mistake, infirmities or temptations; but it implies the being so crucified with Christ as to be able to testify, 'I live not, but Christ liveth in me.'" He regards the sins of a "perfect" Christian as "involuntary transgressions," and does not think they should be called "sins" at all, though he admits that they need the atoning blood of Christ. The Wesleyan Methodists in their religious services use more or less the English liturgy; the morning service being read in many of their chapels, and the sacramental offices being required in all. They observe a "watch-ought" on the eve of the New Year, on which occasion the religious services are protracted till midnight, and their chapels are generally crowded to excess; and in the beginning of the year they hold a "covenant-service," at which congregations stand up to a man (though this form is not invariable), and solemnly vow to serve the Lord. But even the ordinary religious services in some places are frequently marked by an ebullition of fervent feeling on the part of the audience, which has a very singular effect upon a stranger.

3. *History.*—The history of Methodism is for many years the history of Christian effort to evangelise the neglected "masses" of England. The labors of Wesley, and of those whom he inspired to imitate his example, were of the noblest description, and met with remarkable success. The reformation of life which his preaching produced, for example, among the Kingswood colliers and the Cornwall wreckers, is a testimony to the power of religion which cannot be too highly estimated. The zeal which has inspired the body in regard to foreign missions, although in the highest degree honorable, is only the logical development of their efforts at home—for they originally regarded their society in England as simply a vast "home mission," and neither Wesley nor his followers desired to consider themselves a "sect," a new church, in the common usage of the term, but were warmly attached to the old national church, and considered themselves among her true children. When Wesley died (1791), his "societies" had spread over the United Kingdom, the continent of Europe, the States of America, and the West Indies, and numbered 50,000 members. Since then, they have largely increased, and, according to the returns for the year 1875, the membership (including the numbers in foreign missions, embracing continental India, Northern Europe, China, Asia Minor, the South Sea and West India Islands) amounted then to 564,315 (of whom 393,343 belonged to Great Britain and Ireland), and the number of ministers, 2905 (of whom 2050 belonged to the United Kingdom). The annual income of "The Wesleyan Methodist Missionary Society" in 1875 was £190,000.

The Wesleyan M. have three theological colleges for the training of ministers, one at Richmond Hill, Surrey, a second at Didsbury, South Lancashire, and a third at Headingley, in Yorkshire, besides the establishments at Sheffield and Taunton; two schools (New Kingswood School and Woodhouse Grove School) for the education of sons of Wesleyan ministers; and two for the daughters, one at Clapton and another at Southport. The boys receive a six years' and the girls a four years' course of instruction. The Methodist Book-room is situated in the City Road, London, and issues hundreds of thousands of religious publications (tracts, &c.) monthly. The newspapers and other periodicals possessed in connection with the body are the larger and smaller Magazines, the "Christian Miscellany," "Wesleyan Sunday School Magazine," monthly "Exercises on Scripture Lessons," "Early days," the "Watchman," the "Methodist Recorder," and the "London Quarterly Review." Among the more eminent Methodist authors may be named the two Wesleys, Fletcher, Benson, Clarke, Moore, Watson, Drew, Edmondson, Sutcliffe, Jackson, Treffry, Rule, Nichols, Smith, and Etheridge.

METHODIST EPISCOPAL CHURCH, the name given to the Society of Wesleyan M. in the United States of America, where the first members of that body—immigrants from Ireland—established themselves as a religious society in New York in the year 1766. In the course of a year or two, their numbers had considerably increased, and they wrote to John Wesley to send them out some competent preachers. Two immediately offered themselves for the work, Richard Boardman and Joseph Pilmoor, who were followed in 1771 by Francis Asbury and Richard Wright. The agitations preceding the War of Independence which soon afterwards broke out, interrupted the labors of the *English* Methodist preachers in America, all

of whom, with the exception of Asbury, returned home before the close of the year 1777; but the place appears to have been supplied by others of native origin, and they continued to prosper, so that, at the termination of the revolutionary struggle, they numbered 43 preachers and 13,740 members. Up to this time, the American Wesleyan M. had laid no claim to being a distinct religious organisation. Like Wesley himself, they regarded themselves as members of the English Episcopal Church, or rather of that branch of it then existing in America, and their "preachers" as a body of irregular auxiliaries to the ordained clergy. "Episcopal churches," we are informed, "are still standing in New York and elsewhere, at whose altars Embury, Pilmoor, Boardman, Strawbridge, Asbury, and Rankin, the earliest Methodist preachers, received the holy communion." But the recognition of the United States as an independent country, and the difference of feelings and interests that necessarily sprang up between the congregations at home and those in America, rendered the formation of an independent society inevitable. Wesley became conscious of this, and met the emergency in a manner as bold as it was unexpected. He himself was only a presbyter of the Church of England, but having persuaded himself that in the primitive church a presbyter and a bishop were one and the same order, differing only as to their official functions, he assumed the office of the latter, and, with the assistance of some other presbyters who had joined his movement, he set apart and ordained the Rev Thomas Coke, D.C.L., of Oxford University, bishop of the infant church, September 2, 1784. Coke immediately sailed for America, and appeared, with his credentials, at the Conference held at Baltimore, December 25 of the same year. He was unanimously recognised by the assembly of preachers, appointed Asbury coadjutor bishop, and ordained several preachers to the offices of deacon and elder. Wesley also granted the preachers permission (which shews the extensive ecclesiastical power he wielded) to organise a separate and independent church under the Episcopal form of government: hence arose the "Methodist Episcopal Church in the United States of America." Nevertheless, there were not a few who were dissatisfied with the Episcopal form of government. This feeling grew stronger and stronger, until, in 1830, a secession took place, and a new ecclesiastical organisation was formed, called the METHODIST PROTESTANT CHURCH, whose numbers, according to the returns for 1874, amounted to 65,000 members and 924 preachers. In 1842, a second secession took place, chiefly on the question of slavery—the seceders pronouncing all slave-holding sinful, and excluding slave-holders from church membership and Christian fellowship; and in 1843, a meeting was held at Utica, New York, where a new society was constituted and named the WESLEYAN METHODIST CONNECTION OF AMERICA, whose members in 1870 amounted to 30,000 and its preachers to 250. But in 1844 a far larger and more important secession took place on the same question, when the whole of the Methodist societies in the then slave-holding states, conceiving themselves aggrieved by the proceedings instituted at the general conference of New York (1844) against the Rev. James O. Andrew, D.D., one of the bishops, and a citizen of Georgia, who had married a lady possessed of slaves, resolved to break off connection with their northern brethren. Hence originated the METHODIST EPISCOPAL CHURCH, SOUTH, whose numbers in 1874 were as follows: Travelling preachers, 3184; local preachers, 5344; and members, 663,196, including whites, colored, and Indians. To these must be added 200,000 members, forming the African Methodist Episcopal Church, and 170,000 of the African Methodist Episcopal Zion Church. In 1869 a movement began in favor of the re-union of the northern and southern sections of the Methodist Episcopal Churches, which may—now that slavery is abolished—be successfully carried out. It may here be stated that the members of the *Northern Methodist Episcopal Church* amounted in 1874 to 1,345,089.

Returning to the English Wesleyan M., we now proceed to mention the various secessions from the parent body in the order of time.

1. **THE METHODIST NEW CONNECTION.**—This society detached itself from the older one in 1797. Its doctrines and order are the same; the only difference being that it admits one layman to each minister into the Conference, and allows them to share in the transaction of all business, both secular and spiritual. These laymen are chosen either by the circuits, or by "guardian representatives" elected for life by the conference. In 1875, the numbers of the New Connection were: members, 24,700; preachers, 169. There were in addition 2849 members on probation.

3. **PRIMITIVE METHODISTS**, vulgarly designated **RANTERS**, were first formed into a society in 1810, though the founders had separated from the old society some years before. The immediate cause of this separation was a disagreement as to the propriety of camp-meetings for religious purposes; and also upon the question of females being permitted to preach. A third point of difference is the admission to their conference of two lay delegates for every minister. In 1875, their numbers were: members, 179,429; preachers 1169.

3. **INDEPENDENT METHODISTS**, who separated in 1810. They are chiefly distinguished by their rejection of a paid ministry, and number in England and Scotland: members, 4000; preachers, 290; scholars, 6000.

4. **BIBLE CHRISTIANS**, also called **BRYANITES**, were formed by a local preacher named Bryan, who seceded from the Wesleys in 1815. The only distinction between them and the original body appears to be that the former receive the eucharistic elements in a sitting posture. In 1875, their numbers were: members, 26,699; preachers, 276.

5. **UNITED FREE CHURCH METHODISTS** have been recently formed by the amalgamation of two sects of nearly equal numerical strength. The older of these, called the **WESLEYAN ASSOCIATION**, originated in 1834 in the removal of one or two influential ministers from the original connection. Points of difference subsequently appeared with regard to the constitution of the conference.—The younger sect, called the **WESLEYAN REFORM ASSOCIATION**, took its rise in 1849 through the expulsion of several ministers from the parent body on a charge of insubordination, and being founded on the same principles as the last-mentioned community, arrangements were entered into for their union, which was subsequently effected. Church independency, and freedom of representation in the annual assembly, are two of the most prominent distinctive traits in the organisation of the United Methodist Free Church. Their united numbers in 1875 were: members, 71,817; ministers, 875; local preachers, 8266.—The *Wesleyan Reform Union* consists of about 20 ministers and 7000 members, who have not amalgamated with the Methodist Free Churches.

This is perhaps also the most convenient place to notice the **WELSH CALVANISTIC METHODISTS**. They are not a secession from the followers of Wesley, but originated partly in the preaching of his friend and fellow-evangelist, Whitefield, and partly in that of Howel Harris, a Welsh clergyman of the Church of England. Whitefield was a Calvinist; Wesley, as we have seen, was on some points decidedly Arminian. A difference arose between them on the subject of election. Henceforward their paths lay in different directions. Whitefield, however, did not form a religious sect; and after his death (1799), his followers, being left without any distinct bond or organisation, either followed the leading of the Countess of Huntingdon (q. v.), or became distributed among other denominations, a large portion, especially in Wales, becoming absorbed in the new society gradually forming itself through the preaching of Howel Harris and his coadjutors. This body, however, was not formally constituted a religious society till the beginning of this century.

**METHUEN TREATY**, a commercial treaty between England and Portugal in 1703, so-called in consequence of being negotiated by Paul Methuen of Corsham, English ambassador at Lisbon. It was agreed, by the treaty, that the wines of Portugal should be received by England at a rate of one-third less duty than those of France. In 1836, the Portuguese government relinquished the stipulations of the treaty.

**METHYL** is an organic radical homologous with Ethyl (q. v.), being the lowest term in the series  $C_nH_{2n+1}$ ,  $n$  in this case being equal to 2. Its formula is  $C_2H_5$ ; but in its free state, two atoms unite to form a single molecule, so that free methyl is more accurately represented by  $(C_2H_5)_2$ . It is a colorless gas, of specific gravity 1.036; it burns with a very feeble bluish flame, and is not liquefied at a temperature of  $0^\circ$ . It is obtained by acting upon iodide of methyl with zinc, in the same manner as in the preparation of ethyl.

Like ethyl, it forms a very numerous class of compounds, of which the following are the most important: *Hydride of Methyl* ( $C_2H_5, H$ ), known as *Light Carburetted Hydrogen* (q. v.), *Marsh-gas* and *Fire-damp*, may be obtained either as

naturally or artificially. As a natural product, it sometimes issues from fissures in coal-seams, rushing forth as if under high pressure. These discharges of this gas are termed "Blowers" by the miners, and it is by the combustion of this fire-damp that the terrific explosions which occasionally take place in coal-pits are caused. For its combustion, twice its volume of oxygen (and consequently ten times its volume of air) is required; the resulting compounds being one volume of carbonic acid and two of steam. The vitiated air thus produced, which is utterly unfit for respiration, is known as the *after-damp* or *choke-damp*, and is as much dreaded as the explosion itself. Hydride of methyl is also one of the gaseous exhalations from marshes and stagnant pools; and the bubbles that rise to the surface when the mud at the bottom of a pond is stirred up, consists chiefly of this gas. It may be prepared artificially by strongly heating a mixture of crystallised acetate of soda, hydrate of potash, and powdered quicklime. It is a colorless inodorous, tasteless gas, which may be breathed without apparent injury if well diluted with air. *Hydrated Oxide of Methyl* ( $C_2H_5O.HO$ ), known also as *Methylic Alcohol*, *Wood Spirit*, and *Pyroxylic Spirit* under which title its properties are described, is the strict homologue of vinous or ethylic alcohol ( $C_2H_5O.HO$ ). *Oxide of Methyl* ( $C_2H_5O$ ), or *Methylic Ether*, corresponds to the ordinary, or, correctly speaking, the ethylic ether, and, like the latter, is produced by the distillation of a mixture of methylic alcohol and sulphuric acid. Oxide of methyl, like oxide of ethyl, combines with acids to form a class of ethereal salts, or compound ethers, as they are termed by some chemists as, for example: Acetate of Methyl (or methyl-acetic ether),  $C_2H_5O.C_2H_3O_2$ ; Butyrate of Methyl (or methyl-butyric ether),  $C_2H_5O.C_4H_7O_2$ ; Nitrate of Methyl (or methyl-nitric ether),  $C_2H_5O.NO_3$ ; Salicylate of Methyl (or methylsalicylic ether),  $C_2H_5O.C_7H_5O_2$ . The last-named compound may not only be obtained by distilling a mixture of pyroxylic spirit with salicylic and sulphuric acids, but occurs ready formed in the vegetable kingdom, constituting the essential oil procured from the *Betula lenta*, a species of birch, and from the *Gaultheria procumbens*, or *Winter Green*.

Methyl may be made to enter into combination with bromine, iodine, chlorine, and fluorine, the bromide and iodide of methyl being colorless fluids, and the chloride and fluoride colorless gases. Amongst the most interesting of the numerous methyl compounds must be mentioned the artificial bases or alkalies, which can be obtained from ammonia by the substitution of one, two, or three equivalents of methyl for one, two, or three of the equivalents of hydrogen contained in the ammonia.

If only one equivalent of hydrogen is replaced by methyl, the resulting compound is  $NH_2(C_2H_5)$  or  $C_2H_7N$ , an extremely alkaline gas known as *methylamine*, or *methyllia*, which is more soluble in water than any other known gas; water at 55° dissolving 1150 times its bulk. It is a frequent product of the destructive distillation of nitrogenous substances; and it is present when many natural alkaloids, such as narcotine and morphia, are distilled with caustic potash. The product resulting from the substitution of two equivalents of methyl for two of hydrogen, and known as *amethylamine*, closely resembles methylamine. When the three equivalents of hydrogen are replaced by three of methyl, the resulting compound is  $N(C_2H_5)_3$  or  $C_6H_{15}N$ , a colorless gas, which is known as *trimethylamine*, or *trimethyllia*, and has a disagreeable fishy odor. It occurs in large quantity in herring-brine, and has been detected in the spirit in which anatomical preparations have been long kept. It is also found in *Chenopodium vulvaria* (Stinking Goose-foot), in the flowers of *Crataegus oxyacantha* (Common Hawthorn), and in ergot of rye.

**METHYLATED SPIRIT** consists of a mixture of alcohol, of specific gravity 0.836, with 10 per cent. of Pyroxylic (q. v.) or wood-spirit. This addition of wood-spirit renders it unfit for drinking, although it scarcely interferes with its power as a solvent. It is allowed by the excise to be sold duty-free for manufacturing purposes, and for preserving specimens in museums.

**METHYLENE**. Bichloride of ( $C_2H_2.Cl_2$ ), is an organic compound which has recently attracted much attention from its value as an anæsthetic agent. Dr Richardson, who has long been studying the physiological properties of the methyl-compounds, with the view of finding amongst them a safer compound than chloro-

form, believes, from his experiments on animals, that in the subject of this article he has found such a compound. As the deaths from chloroform may be computed, according to him, at one in 1500 administrations, it is obvious that there is reason for searching for a still safer anæsthetic agent. Dr Suow, as is well known, thought that he had discovered an almost positively safe agent in Amylene ( $C_{10}H_{16}$ ); but the value of more than 200 safe administrations was at once destroyed by two rapidly succeeding deaths; and hence a large number of successful cases of the new agent must be reported before it will displace chloroform from its present well-deserved position. In the article on METHYL (q. v.), we have shewn that the composition of hydride of methyl (or marsh gas) is expressed by  $C_2H_6$ , H, which may be written  $C_2HHHH$ . Now, according to the theory of substitutions, one, two, three, or even all four of the atoms of hydrogen may be replaced by a corresponding number of atoms of chlorine. Thus, (a) if one atom of H be replaced by one atom of Cl, we have *chloride of methyl*,  $C_2H_5Cl$ ; (b) if two atoms of H are replaced by two atoms of Cl, the resulting compound is *bichloride of methylene*,  $C_2H_4Cl_2$ , the  $C_2H_4$  here representing a new radical termed *methylene*, of which very little is known; (c) if three atoms of H are replaced by three atoms of Cl, the resulting compound is *trichloride of formyle*,  $C_2HCl_3$ , or common chloroform, another radical, viz., *formyle*,  $C_2H$ , now appearing; (d) if the whole of the H is replaced by Cl, the resulting compound is *tetrachloride of carbon*,  $CCl_4$ . We thus have four new bodies which may be constructed step by step out of hydride of methyl or marsh gas, and similarly, by starting with tetrachloride of carbon, the chemist may retrace the individual stages till he gets back to marsh gas. All these derivatives of marsh gas possess the power of producing anæsthesia when they are inhaled as vapor by men and animals. That the latter two—viz., chloroform and tetrachloride of carbon—possess this power, has been long known, Dr P. Smith having especially directed attention to the properties of the last named compound; but that the first two also exert the same influence is a fact new to science, for which we are indebted to Dr Richardson. "I discovered," he observes, "that chloride of methyl was a certain and gentle anæsthetic in July [1867] last, and this led me to hope that something more stable and manageable could be obtained—something that should stand between the chloride of methyl and chloroform. That substance is now found in the bichloride of methylene. That this compound would produce rapid, safe, and easy general anæsthesia, I discovered by experiment on August 30th of the present year."—"Med. Times," October 19, 1867.

It is a colorless fluid, having an odor like that of chloroform; and is pleasant to inhale, as it causes little irritation to the mucous membrane. It boils at  $58^\circ$ , and has a spec. gr. of 1.344, while that of its vapor is 2.937 (or nearly three times that of air). Hence, it boils at a lower temperature than other anæsthetics; while its specific gravity, both as a liquid and a vapor, is lower than that of chloroform, but much higher than that of ether; hence, from its easier evaporation, it requires more free administration than chloroform, and, from its greater vapor density, it should be given less freely than ether. It mixes readily with absolute ether, and this combination yields a vapor containing corresponding proportions of each, their boiling-points only differing at most by  $4^\circ$ . It also combines with chloroform in all proportions. It should have a neutral reaction to test-paper. If a trace of acid be present—which is possible, but not probable—its inhalation might prove dangerous. To prevent decomposition, it should, like chloroform, be well guarded from the action of light.

Pigeons are the animals which Dr Richardson most employs for experiments on anæsthetic agents generally. They present various advantages over most other animals; one of the most important being that they die with singular readiness under the influence of these agents. On exposing three pigeons to the action of the vapor of a drachm of chloroform, bichloride of methylene, and tetrachloride of carbon, the peculiarity in the action of the bichloride is the absence, in the sleep it produces, of the so-called second degree of narcotism. The bird glides from the first degree directly into the third, or that of absolute insensibility. The bichloride enters the circulation freely, and sustains the insensibility so well, that intervals of many minutes may be allowed to pass without readministration; while, from its being transformed altogether into vapor at a temperature lower than that of the body, it can be more readily eliminat-

ted from the system than chloroform, or tetrachloride of carbon, when its administration is withheld. On animals, it acts more evenly on the respiration and circulation than any other of the various substances which Dr Richardson has tried; and the only drawback, yet observed, is, that it sometimes produces vomiting; but this misadventure, so far as we know, has not yet been observed when it has been administered to the human subject, and pigeons are known to vomit on slight provocation. The numbers of the respirations and of the pulse rise and fall together, which "is a good point, because there is no condition more perilous than disturbed balance of the circulating and respiratory systems."

All anaesthetics given by inhalation after a certain dose destroy life; but that the destructive power of this new agent is less than that of either chloroform or tetrachloride of carbon, seems proved.

On trying the vapor upon himself, after ascertaining that it could be safely given to the lower animals, Dr Richardson inhaled it until it produced insensibility. "I found the vapor very pleasant to breathe and little irritating, while drowsiness came on and unconsciousness without any noise in the head or oppression. I recovered also, as the animals seemed to recover, at once and completely. I felt as though I had merely shut my eyes, and had opened them again. In the meantime, I had, however, performed certain acts of a motor kind unconsciously; for I inhaled the vapor in the laboratory, and there went to sleep, but I awoke in the yard adjoining. This was on September 28th last, when I inhaled from a cup-shaped sponge. Since then, I have inhaled the vapor in smaller quantities from several instruments, with the effect of proving that there is little difference required for its administration and that of chloroform. A little more bichloride is required in the earlier stages than would be required if chloroform were being used, the fluid being more vaporisable. One drachm of bichloride to forty minims ( $\frac{2}{3}$ ds of a drachm) of chloroform, represents the difference required; but when the narcotism is well set up, less of the bichloride is required to sustain the effect."

The materials on which this article is based are taken from a lecture delivered by Dr Richardson on the 8th of October 1867. In an address on Anaesthetics by Dr Tidy, published in the "British Medical Journal," Jan. 4, 1879, it is mentioned that Mr Morgan, a dentist, has "administered methylene 1800 times to persons of all ages, and for periods varying from a few minutes to three-quarters of an hour, without a single accident. He also regards it as safer than chloroform, and speaks of the rapidity with which it effects complete unconsciousness, as a rule two minutes only being needed; the rapidity of recovery, from one to three minutes only being required for the anaesthesia to pass away; and lastly, the rapidity with which consciousness may be abolished, if it return during the operation—as the chief points in its favor. The cause of death from its administration is syncope, not coma; hence, a bloodless condition of the lips—a point easily to be noticed—is the principal indication of danger."

On the other hand, the preliminary report on the action of anaesthetics presented to the committee of the British Medical Association, and published in the same number of the "Journal," does not speak so favorably of methylene. The so-called bichloride of methylene, it is alleged, has no definite and constant boiling point, and therefore appears to be a mixture. The formula, as now generally used,  $\text{CH}_2\text{Cl}_2$ , shews it to be a compound of chloride of methyl and chloroform ( $\text{CH}_3\text{Cl} + \text{CHCl}_3$ ). With frogs under methylene it was found that the heart became rapidly affected and soon stopped. With rabbits, respiration rapidly deteriorated and stopped while the heart was still beating. In an experiment with artificial respiration and exposure of the heart, the heart was weakened and soon stopped, but not as rapidly as with chloroform. As in the case of chloroform, the right ventricle became enormously distended, the first sign of paralysis being the commencement of the distension. [Ether does not affect the heart.] The experimenters found that as anaesthetics, *Isobutyl Chloride* ( $\text{C}_4\text{H}_9$ ) and *Ethidene Dichloride* ( $\text{C}_2\text{H}_2\text{Cl}_2$ ) combine the advantages of speed and safety, and are therefore preferable to methylene.

*Chloride of Methyl*, the first of the compounds derived by substitution from hydride of methyl, has, according to good authorities, also valuable remedial qualities. Half an ounce of it, diluted with water, and with the addition of a little sugar, acts as a pleasant but potent intoxicator. In smaller doses, it might be useful as a soothing and refrigerating agent.

**METONIC CYCLE**, so called from its inventor, Meton, who flourished at Athens about 483 B.C., is a cycle of 19 years, at the end of which time the new moons fall on the same days of the year, and eclipses recur in nearly the same order. This arises from the circumstance, that 19 solar years are nearly equal to 235 lunations, their average values being 6939.68835 and 6939.60249 days respectively.

**METONYMY** (Gr. *metonymia*, signifying a change of name) is a figure of speech by which one thing is put for another to which it bears an important relation, as a part for the whole, the effect for the cause, the abstract for the concrete, &c. For example, "*Lying lips* are an abomination to the Lord." This figure is very expressive, and is much used in proverbial and other pithy modes of speech.

**METOPÉ**, the space, in the frieze of the Doric order, between the triglyphs—generally ornamented with figures, or bulls' heads, or pateræ.

**METRA**, an ingenious pocket-instrument, invented by Mr Herbert Mackworth, about 1858. It combines the thermometer, clinometer, goniometer, anemometer, level, plummet, scales, &c., so that, by its assistance, travellers or engineers can at once record their observations. It enables us to determine the dip of rocks, angles of crystals, temperature, rate of wind, to take levels of large surfaces, determine latitude, and a variety of other matters connected with physical science. As a pocket-instrument, it is of great value.

**METRE** (Gr. *metre*) is that regulated succession of certain groups of syllables in which Poetry (q. v.) is usually written. A greater or less number of groups forms a *line* or *verse* (Lat. a turning), and in modern languages, the verses usually rhyme with one another; although this is not at all essential to the notion of metre. See **RHYME**, **BLANK VERSE**. In the classic languages, metre depended upon the way in which long and short syllables were made to succeed one another. English metre depends, not upon the distinction of long and short, but upon that of *accented* and *unaccented* syllables. Thus, in the lines,

The cu'r'few to'ls | the kne'll | of pa'r't'ing da'y—  
Wa'rriors and | ch'iefs, should the | sha'ft or the | swo'rd—

the accents occur at regular intervals; and the groups of syllables thus formed constitute each a metre, or measure. The groups of long and short syllables composing the metres of classic verse, were called *feet*, each foot having a distinctive name. The same names are sometimes applied to English measures, an accented syllable in English being held to be equivalent to a long syllable in Latin or Greek, and an unaccented syllable to a short.

Every metre in English contains one accented syllable, and either one or two unaccented syllables. As the accent may be on the first, second, or third syllable of the group, there thus arise five distinct measures, two dissyllabic and three trisyllabic, as seen in the words—1, fo'lly (corresponding to the classic Trochee); 2, reca'll (Iambus); 3, te'rribly (Dactyle); 4, confu'sion (Amphibrachys); 5, absen'tee' (Anapaest).

These measures are arranged in *lines* or *verses*, varying in length in different pieces, and often in the same piece. The ending measure of a line is frequently incomplete, or has a supernumerary syllable; and sometimes one measure is substituted for another. All that is necessary is, that some one measure be so predominant as to give a character to the verse. Constant recurrence of the same measure produces monotony. The following lines exemplify the five measures:

*1st Measure.*

Ri'ch the—treas'ure.  
Be'tter | ai'xty | yea'rs of | Eu'rope | tha'n a | cy'cle | of Ca | tha'y.

*2d Measure.*

Alo'ft | in a'w | ful sta'te.  
The pro'pler stu'd | y of | manki'nd | is ma'n.

*3d Measure.*

Bi'rd of the | wi'derness.  
Wa'rriors and | ch'iefs, should the | sha'ft or the | swo'rd.

## 4th Measure.

The de'w of | the mo'ring.  
O you'ng Loch|inva'r has | come ou't of | the we'st.

## 5th Measure.

As they ro'ar | on the sho'ro.  
The Assy'r | ian came do'wn | like a wo'lf | on the fo'ld.

It is instinctively felt that some of these measures are better suited for particular subjects than others. Thus, the first has a brisk, abrupt, energetic character, agreeing well with lively and gay subjects, and also with the intense feeling of such pieces as "Scots, wha ha'e." The second is by far the most usual metre in English poetry; it occurs, in fact, most frequently in the ordinary prose-movement of the language. It is smooth, graceful, and stately; readily adapting itself to easy narrative, and the expression of the gentler feelings, or to the treatment of severe and sublime subjects. The trisyllabic metres, owing to the number of unaccented syllables in them, are rapid in their movement, and calculated to express rushing, bounding, impetuous feelings. They are all less regular than the disyllabic metres. One of them is frequently substituted for another, as in the opening of Byron's "Bride of Abydos:"

Know' ye the | la'nd where the | cy'press and | my'rtil  
Are e'mblems | of dee'ds that | are do'ne in | their cl'ime;  
Where the ra'ge | of the vu'l | ture, the lo've | of the tu'r | tle—

where each of the three lines is in a different metre. In addition to this irregularity, one of the unaccented syllables is often wanting. For instance, in Mrs Hemans's poem, "The Voice of Spring:"

I co'me, | I co'me ! | ye have ca'll'd | me lo'ng;  
I co'me | o'er the mou'n | tains with li'ght | and so'ng—

the first line has only one measure of three syllables, although the general character of the versification is trisyllabic.

In a kind of verse introduced by Coleridge, and used occasionally by Byron and others, the unaccented syllables are altogether left out of account, and the versification is made to depend upon having a regular number of accents in the line:

There i's not wi'nd enou'gh to twi'rl  
The o'ne red le'af, the la'st of its cla'n,  
That da'n'ces as o'ften as da'n'ce it ca'n  
On the to'pmost twi'g that looks up at the sky'.

Here there are four accents in each line, but the number of syllables varies from eight to eleven.

To scan a line or group of lines, is to divide it into the measures of which it is composed.

The variety of combinations of metres and rhymes that may be formed, is endless; but a few of the more usual forms of English versification have received special names, and these we may briefly notice.

*Octosyllabics* are verses made up each of four measures of the second kind of metre, and therefore containing eight (*octo*) syllables:

With fru'it | less la' | bor, Cla' | ra bon'nd  
And stro've | to sta'nch | the gu'sh | ing wo'und.

Scott's poems are mostly in octosyllabics, and so is "Hudibras," and many other pieces.

*Heroic* is a term applied to verses containing *five* metres of the second kind, or ten syllables. Heroics either rhyme in couplets, or are without rhymes, constituting blank verse. Many of the chief narrative and didactic poems in the English language are in rhyming heroics; as those of Chaucer, Dryden, Pope, Cowper, &c. Milton's two great poems, Young's "Night Thoughts," Thomson's "Seasons," Cowper's "Task," Wordsworth's "Excursion," and many others, are written in

**Metre**  
**Metternich**

34

blank heroics. Metrical dramas are almost always in blank verse; in which case there is frequently a supernumerary syllable, or even two, at the end of the line:

To be, | or not | to be, | that is | the ques | tion:  
Whether | 'tis no | bier in | the mind | to suf | fer.

In *Elegiacs*, the lines are of the same length and the same measure as in heroics; but the rhymes are alternate, and divide the poem into quatrains or stanzas of four lines, as in Gray's "Elegy." The Spenserian stanza, popularised by Spenser in the "Fairy Queen," and much used by Byron, differs from common heroics only in the arrangement of the rhymes, and in concluding with an Alexandrine (q. v.).

*Service metre*, also called *common metre*, is the form of versification adopted in the metrical Psalms, in many hymns, and other lyrical pieces. From being frequently employed in ballads, this metre is also called *ballad metre*. The first and third lines often rhyme, as well as the second and fourth.

Such are some of the more usual and definite forms of versification. In many poems, especially the more recent ones, so much licence is assumed, that it is difficult to trace any regular recurrence or other law determining the changes of metre, or the lengths of the lines; the poet seeks to suit the modulation at every turn to the varying sentiments. But it may be questioned whether much of this refinement of art is not thrown away, upon ordinary readers at least, who, failing to perceive any special suitableness, are inclined to look upon those violent departures from accustomed regularity as the results of caprice.

The kind of verse called *Hexameter* is described under its own name.

**METRE**, the basis of the "metrical" or modern French system of weights and measures, and the unit of length. The first suggestion of a change in the previous system dates as far back as the time of Philippe le Bel; but up till 1790, no important change had been effected. On the 8th May 1790, proposals were made by the French government to the British, for the meeting of an equal number of members from the Academy of Sciences and the Royal Society of London, to determine the length of the simple pendulum vibrating seconds in lat. 45° at the level of the sea, with the view of making this the unit of a new system of measures. The British government, however, did not give this proposal a favorable reception, and it fell to the ground. The French government, impatient to effect a reform, obtained the appointment by the Academy of Sciences of a commission composed of Borda, Lagrauge, Laplace, Monge, and Condorcet, to choose from the following three, the length of the pendulum, of the fourth part of the equator, and of the fourth part of the meridian, the one best fitted for their purpose. The commission decided in favor of the last—resolving that the 1-10,000,000th of a quadrant of the meridian (the distance from the equator to the pole, measured as along the surface of still water) be taken for the basis of the new system, and be called a "metre." Delambre and Mechain were immediately charged with the measurement of the meridian between Dunkerque and Barcelona; and the result of their labors was referred to a committee of twenty members, nine of whom were French, the rest having been deputed by the governments of Holland, Savoy, Denmark, Spain, Tuscany, and the Roman, Cisalpine, Ligurian, and Helvetic republics. By this committee, the length of the metre was found to be 443·296 Parisian lines, or 89·3707904 English inches; and standards of it and of the kilogramme, (see **GRAMME**) were constructed, and deposited among the archives of France, where they still remain. The "metrical system" received legal sanction 2d November 1801. The following are the multiples and fractions of the metre which are in common use, expressed in English measure:

	English Inches.		English Feet.	English Yards.
Millimètre,	·0893707904			
Centimètre,	·893707904			
Decimètre,	8·93707904			
<b>METRE,</b>	89·3707904	=	8·2808392	= 1·093633
Decamètre,	893·707904	=	82·848992	= 10·93633
Hectomètre,	8937·07904	=	828·08992	= 109·3633
Kilomètre,	89370·7904	=	8280·8992	= 1093·633
Myriamètre,	893707·904	=	82808·992	= 10936·33

From the metre, the other principal units of measure and weight are at once derived. See **ARE**, **LITRE**, **GRAMME**, **FRANC**.

**METRONOME**, a valuable small machine for indicating the correct time or speed at which a musical composition should be played. It was invented in 1815 by Mälzel, the inventor also of the automaton trumpeter. See **AUTOMATON**. The test of a correct metronome is, that when set at 60 it shall beat seconds.

**METROPOLIS LOCAL MANAGEMENT ACT**. The metropolis of the United Kingdom, owing to its immense size, has been regulated for sedile and sanitary purposes chiefly by special acts, one of which is called the Metropolis Local Management Act. It had long been subject to a special Building Act, which laid down minute regulations as to the formation of streets, alteration and building of houses; and the Metropolis Buildings Act still contains a code applicable to building regulations, the chief principle of which is, that no person can build or make alterations till they have been duly approved by the inspectors, whose duty it is to see that certain conditions have been complied with as regards the public safety. In 1855, a great change was made in the internal economy of the metropolis, by the Metropolis Local Management Act, which created the Metropolitan Board of Works, and provided it with extensive powers of drainage, sewerage, lighting, cleaning, removing nuisances, and general improvements, and with powers also to rate the occupiers of houses for the expenses of the general management. Formerly, each vestry did what it thought proper within its own parish, and there was no uniformity observed in the details of management. But the above act contained a code of laws affecting numerous details of street and city life. One important function was the systematic construction of sewers and the removal of nuisances. No new building is now allowed to be built without sufficient drains and water-closets. Paving is enforced in most cases.

**METROPOLITAN**. In Church Law, the bishop of a *metropolis*, or "mother city," upon which other episcopal cities are in some sense dependent. The gradations of the hierarchy, on which this dependence is founded, are of very early origin, and may, it is alleged, be traced, at least in germ, in the letters of St Paul to Timothy and to Titus. The commentaries of the Fathers (as Chrysostom, 15 "Hom. in 1 Tim.," and Eusebius, "Hist. Eccles." 1. iii. c. iv.) recognise it as of apostolic institution. The jurisdiction of metropolitans, according to the ancient law of the church, was very considerable, and extended over all the bishops of that province of which the metropolitan see was the capital. It was their privilege not only to summon and preside over provincial councils, to consecrate the provincial bishops, but also to decide certain causes, and in other ways to exercise authority within the sees of their suffragans. Recent canons have very much restricted their powers. The metropolitan is distinguished from an ordinary archbishop by his having suffragan bishops subject to him, which is not necessarily the case of an archbishop.

In the Church of England, the archbishops of Canterbury and York are metropolitans, and in the Protestant Episcopal Church of Ireland, those of Armagh and Dublin. In the newly-constituted hierarchy of the Roman Catholic Church in England, the Archbishop of Westminster has the rank of metropolitan. In the Roman Catholic Church of Ireland, the Archbishops of Armagh, Dublin, Cashel, and Tuam all possess the same rank.

**METTERNICH**, Clemens Wenzel Nepomuk Lothar, Prince von Metternich, and Duke of Pontella, an eminent Austrian diplomatist and statesman, born at Coblenz, 15th May 1773. His father, Franz Georg Karl, Count von Metternich, was also an Austrian diplomatist, and an associate of Kaunitz. He represented a very ancient and distinguished family, whose original seat was in Jülich. Young M. was educated at the university of Strasburg, and afterwards studied law at Mainz and travelled in England. In 1795, he married the grand-daughter and heiress of the celebrated minister Kaunitz, by whom he acquired large estates. His diplomatic career commenced at the congress of Rastadt, which he attended as representative of the Westphalian counts. His rise was very rapid; he added to the advantages of his birth and connections, a more than ordinary share of diplomatic ability, with the most graceful and winning manners. In 1801, he became Austrian ambassador at Dresden; and on the outbreaking of the third coalition war, he negotiated the treaty of alliance between Austria, Prussia, and Russia. In 1806, he went as ambassador to Paris, and concluded, in 1807, the treaty of Fontainebleau, very favorable to the in-

Mettray  
Meuse

36

terests of Austria; but on the outbreaking of the war between France and Austria in 1809, he was detained some time ere he could obtain his passport. In course of that year, he succeeded Count Von Stadion as Minister of Foreign Affairs, concluded the treaty of peace with the French minister Champagny, and accompanied the Empress Maria Louisa to Paris. He guided the course of Austria amidst the difficulties of 1812-1813. He maintained at first a temporising policy and a scheme of an armed mediation of Austria; but the obstinacy of Napoleon reduced him to the necessity of adopting at last a decided step, and led him to resolve upon that declaration of war by Austria against France, which took place in August 1813, and he subsequently conducted with great ability the negotiations which ended in the completion of the quadruple alliance. On the eve of the battle of Leipzig, the emperor of Austria bestowed upon him the princely dignity. He was afterwards employed in almost all the chief diplomatic affairs of that eventful time; and after the congress of Chatillon and negotiations with the Count d'Artois, he went to Paris, and signed the convention of Fontainebleau with Napoleon, went to England to negotiate concerning a new quadruple alliance, and attended the congress of Vienna, of which he was unanimously elected president. He signed, as Austrian plenipotentiary, the second peace of Paris, 20th November 1815. After this, he continued still to conduct the diplomacy of Austria, and in 1831 was appointed chancellor (*Haus-, Hof- und Staatskanzler*), and in 1836 succeeded Count Zichy in the presidency of ministerial conferences on home affairs. His efforts were now earnestly directed to the maintenance of peace in Europe, and the preservation of the existing state of things in the Austrian dominions by the strictest measures of police and severe despotism. The revolutionary movement of 1848 breaking forth with sudden violence, caused the aged minister to flee from Austria, and to seek refuge in England; nor did he return to Vienna till the end of 1851, when he received great marks of honor and favor from the emperor; but although sometimes consulted, he was never again asked to undertake the cares of office. He died at Vienna, 11th June 1859. The general opinion respecting M. has been well expressed by the "Times" newspaper: "He was renowned rather than great, clever rather than wise, venerated more for his age than his power, admired but not lamented." His son Richard became ambassador at the Court of Napoleon III., after the peace of Villafranca.

**METTRAY.** The Reformatory of M. is the true parent of all institutions intended to reform and restore to society, and not merely to punish, juvenile delinquents. M. Demetz, a member of the Parisian bar, struck with the evils and hardship attending the commitment to prison of young, and, considering their training and habits, scarcely responsible criminals, there to languish hopelessly for a time, and then to emerge worse than when they entered, resolved, in conjunction with the Vicomte Bretignères de Courteilles, to found a school which should have for its object the reformation of this class of offenders. In 1839, accordingly, the Reformatory, or, as it is called, the Colony of Mettray, was set on foot, about five miles from the city of Tours in France. Thms M. Demetz, by his assiduous labors and self-devotedness, rendered to France and Europe one of the greatest benefits that could be conferred on society, by proving that, by agricultural and other labors of industry, and well-considered rules of organisation and discipline, the neglected and criminal may be trained to take their place honestly and honorably in society. The children consist wholly of orphans, foundlings, and delinquents, and, in 1872, amounted in number to 792. From the foundation up to that date, 4287 had been received. The relapses into crime of those who had left the colony amounted only to about 4 per cent. The success of this establishment is to be attributed not solely to the excellent training and close supervision at M. itself, but to the care which is taken to preserve the link between the authorities and those who have left the colony. A small payment is made by the state for children sent under judicial sentence; the large extra expenditure necessarily incurred being defrayed from charitable contributions from the individuals constituting the "Paternal Society of Mettray."

**METZ,** the strongest fortress of the German imperial territory of Alsace-Lorraine, and capital of the district of Lorraine; before 1871, the main bulwark of France in her north-eastern frontier and capital of the department of Moselle. It is situated on the Moselle at its confluence with the Sella. The strength of M. con-

sists in its exterior defences, of which the principal are eleven forts, partly strengthened and improved since the German occupation, and partly entirely new. The city contains many important institutions, barracks, hospital, military schools and arsenals. The cathedral, a Gothic edifice, begun in 1014, and finished in 1546, is remarkable for its boldness, lightness, and elegance, and has a beautiful spire of open work, 273 feet in height. The industry of M. is active; there is a good trade in wine, brandy, indigo, glass; and there are several cloth manufactories in the neighborhood. The pop. of M., which in 1869 was 49,325, had in 1875, by reason of emigration into France, decreased to 37,925, or with garrison, 45,556.

M., known to the Romans as *Divodurum*, was afterwards called Mettis (corrupted from *Mediomatrici*, the name of the people), and hence the present form. Under the Franks, M. was the capital of Austrasia (q. v.). At the division of Charlemagne's empire, M., with the rest of Lorraine (q. v.), fell to Germany and was afterwards made a free city of the Empire. In 1552, it was treacherously taken possession of by the French; and although Charles V. besieged the place from October 1552 to January 1553, they kept it till it was formally ceded to them in 1648. In August 1870, Bazaine was compelled to retire into M. with his army; and after an investment of 70 days, during which no attempt was made to take the city by force (not even a single shell having been fired into it), Enrope was startled to hear of the capitulation of M., by which 180,000 men and immense military stores fell into German hands (27th October 1870). By the treaty of Frankfurt, M. was annexed to Germany as part of Lorraine.

MEUDON, a town of France, in the dep. of Seine-et-Oise, 5 miles west of Paris, on the Versailles and Paris Railway. The *château*, approached by a fine avenue of four rows of lime-trees, was built by the side of an older *château*, the work of Phillibert Delorme, by the Grand Dauphin, son of Louis XIV., in 1699. During the Revolution, it was converted into a factory for warlike engines, and surrounded with a permanent camp, to keep out spies. The *château*, as it exists at present, was fitted up for Marie Louise by Napoleon, in 1812. It has a fine terrace, gardens beautifully laid out, and commands a very fine prospect. The Forêt de Meudon is a favorite holiday resort of the Parisians. Near it has been erected an expiatory chapel, dedicated to Notre Dame des Flammes, marking the spot where a terrible railway accident occurred in May 1842, in which more than 100 persons were burned alive. Whiting is manufactured to a considerable extent, and there are numerous beach-fields. Rabelais was curé of M. for a long time. The *château* was for many years a favorite summer residence of Prince Napoleon. Pop. (1876) 6385.

MEU'LEBEKE, a town of Belgium, in the province of West Flanders, 20 miles south-west of Ghent, on the Mandel, a tributary of the Lys. Weaving is carried on, and there are several breweries. It is near a railway, which connects it with Bruges and other places. Pop. 8,300.

MEURTHE, formerly a department in the north-east of France, immediately south of the former department of Moselle. The area was about 2254 sq. miles; pop. in 1866, 428,387. Its surface is undulating and picturesque; while along the eastern border run the Vosges Mountains, rising in one point to 1148 feet in height. The chief rivers are the Moselle, and its affluents the Meurthe, the Madon, the Sèille, &c. This district is no less remarkable for the beauty of its scenery, than for the fertility of its soil and the variety of its productions. After the treaty of Frankfurt, by which part of M. was ceded to Germany, the rest of M., together with the small part of the department of Moselle that remained to France, was formed into a new department under the name MEURTHE-ET-MOSELLE; area, 2015 sq. miles; pop. (1876) 404,600. Arrondissements: Nancy, Lunéville, Toul (from M.), and Briey (from Moselle); capital, Nancy.

MEUSE, a frontier department in the north-east of France. Area, 2400 sq. miles; pop. (1876) 294,054. The surface is traversed from south-east to north-west by two parallel ranges of hills, which form the right and left bank of the river Meuse (see MAAS), and separate it from the basin of the Seine on the west, and from that of the Moselle on the east. The Meuse, the Ornain, and the Aire, are the chief rivers. The soil is generally poor, except in the valleys of the principal rivers, which are remarkably fertile and well cultivated. The usual crops are raised in average quantities. 22,000,000 gallons of wine (red and white) are made annually.

The four arrondissements are Bar-le-Duc, Commercy, Montmédy, and Verdun. The capital is Bar-le-Duc.

MEXICO constitutes the south-west extremity of North America, and occupies a portion of the isthmus which connects the latter with the south part of the American continent. It is bounded on the n. by the territories of the United States, on the w. by the Pacific Ocean, on the s. by the Pacific and Central America, and on the e. by the Gulf of Mexico. The area of M. is about 750,000 square miles, and the pop. (1878) about 9,840,000. In 1861, the 8,000,000 inhabitants were thus distributed amongst the various races: Indians, 4,800,000; whites, 1,004,000; half-breeds, 1,190,000; negroes, 6000. The following table gives the names of the provinces and their chief towns, with the populations for 1869:

States.	Pop. in 1869.	Chief Towns.	Population.
Agua Calientes.....	140,630	Agua Calientes.....	22,534
Campeachy.....	80,366	Campeachy.....	15,196
Chiapas.....	193,187	San Cristobal.....	10,475
Chihuahua.....	179,971	Chihuahua.....	12,000
Cochilla.....	95,397	Saltillo.....	8,106
Colima.....	68,333	Colima.....	31,000
Durango.....	185,077	Durango.....	12,419
Guanajuato.....	874,043	Guanajuato.....	62,000
Guerrero.....	300,929	Tixtla.....	6,501
Hidalgo.....	404,207	Pachuca.....	13,000
Idaleco.....	924,580	Guadalajara.....	70,000
Mexico.....	653,688	Toluca.....	12,000
Michoacan.....	618,240	Morelia.....	26,000
Morelos.....	150,384	Cuernavaca.....	.....
Nuevo Leon.....	174,000	Monterey.....	13,500

Federal District.....	275,996	Mexico.....	200,000
California.....	21,645	La Paz.....	500

*Physical Character, &c.*—The great mass of the Mexican territory consists of an elevated plateau, formed by an expansion of the Cordilleras of Central America (q. v.), from which terraced slopes descend with a more or less rapid inclination towards the Atlantic on the east, and the Pacific on the west. This vast tract, which extends from 18° to 32° n. lat., and from 95° to 115° w. long, comprises one of the richest and most varied zones in the world; for while its geographical position secures to it a tropical vegetation, the rapid differences of elevation which characterise it, afford it the advantages of temperate climates, in which all the varieties of our European flora and fauna can come to perfection; and it thus combines within its limits an almost unparalleled exuberance and multiplicity of natural products. The table-lands of M. lie at elevations varying from 5000 to more than 9000 feet above the level of the sea, and exhibit great differences of level and varieties of soil. They generally incline northward, and are for the most part girt in by low mountain chains, among which rise individual lofty peaks, as Cofre de Perote (13,400 feet), Orizava (17,370 feet), and others; while they are intersected by higher ranges, above which tower a few cones, as Iztaccihuatl, the White Woman (15,700

feet), and the volcano of Popocatepetl, or the Smoking Mountain (17,880 feet). These volcanoes and several others of less note, lying within the parallels of  $18^{\circ} 15'$  and  $19^{\circ} 30'$  n. lat., form a transverse volcanic band between the two oceans, and do not follow the inclination of the central chain, as is the case in the volcanoes of South America. Volcanoes also occur isolated, as, for instance, in the plain of Mixtcapan, 2900 feet above the sea, where, in 1719, the volcano of Jorullo, which still emits smoke, was formed after an eruption by which a surface of many square miles was raised several feet above the level of the plain; in fact, every part of the Mexican territory betrays the volcanic nature of its formation, although neither earthquakes nor any other active phenomena have of late been of frequent occurrence. The principal chain, intersecting the table-land, is the Sierra Madre, or Tepe Suene, in which lie the chief gold and silver mines, and which, after traversing the states of Queretaro and Guanajuato, divides into three main branches, the central of which forms the water-shed between the Pacific Ocean and the Gulf of Mexico. In addition to these great chains, the Mexican territory is intersected by numerous lesser ranges, which on the Pacific side break up the terraced declivities into innumerable deeply-cleft valleys, which assume almost the character of steep ravines near their junction with the narrow littoral plains of the Pacific Ocean. Violent storms rage on this coast, blowing from the south-west during the hot months, when the climate is as prejudicial to whites as on the Mexican Gulf, although it is not visited by the yellow fever. M. may be said to be generally deficient in navigable rivers; for although some of the largest have a course of more than 1000 miles, few are free from rapids. The Rio Santiago, or Rio Grande, with a course of 500 miles, is broken near Guadalajara by 60 falls in the space of less than three miles; the Rio Grande del Norte, which forms in its lower courses the boundary between M. and the United States, has a winding course of nearly 1800 miles, but it is only navigable for small sailing-vessels to Matamoras, 60 miles from its mouth, where a bar and numerous shoals prevent the passage of large vessels. A similar remark applies to the majority of the rivers which fall into the Gulf of Mexico. The eastern coast generally presents great obstacles to navigation, as it is low and sandy, unbroken by bays or inlets, and lined by sandbanks several miles in width; the only points of access being the mouths of rivers, which are not good roadsteads, as, with few exceptions, the rivers have little water, except at the rainy season, which generally sets in about June, accompanied by overpowering heat, during the prevalence of which the yellow fever, or *comito prieto*, rages like a pest in all the low lands. M. is on the whole badly supplied with water; and since the Spaniards have discontinued the system of irrigation, which was followed by the Aztec races with so much success, many tracts have become barren, and unsuited for the purposes of human occupation. A great portion of the table-lands can only be used for pasture. Springs are rare, and many of the rivers flow in deep mountain-beds, without receiving smaller tributaries, while the rapid evaporation on a light soil, covering porous rocks, leaves the surface dry and hot, and unable to support any vegetation beyond the cactus and some low grasses. The plains, moreover, contain the beds of numerous dry salt lakes, but this is chiefly the case on the north and east of the table-land. The western parts of the plateaux between  $100^{\circ}$  and  $102^{\circ}$  w. long. (known as the Baxio) yield, by careful irrigation, rich crops of maize and wheat, and rank among the most fertile agricultural districts of Mexico. They are, however, here and there interrupted by sterile tracts, either covered by stones, and then known as "pedregal," or with lava, when they are characterised as a *mal país* (bad country). In contrast with these unprofitable districts, the plains are occasionally broken by depressions of the soil, known as *Barrancas*, descending sometimes 1000 feet, and measuring several miles across, which are covered with a luxuriant vegetation of trees and shrubs, and watered by small streams running through the middle of the valley. M. has numerous lakes, but few of any importance; that of Chapala in Jalisco is one of the most considerable, being more than 90 miles long.

*Climate, Products.*—The differences of climate, depending upon the different degrees of altitude, are so great in M., that the vegetable products of this vast country include almost all that are to be found between the equator and the polar circle. In the course of a few hours, the traveller may experience every gradation of climate,

embracing torrid heat and glacial cold, and pass through different zones of vegetation, including wheat and the sugar-cane, the ash and the palm, apples, olives, and guavas. The Spaniards, on their first occupation of M., distinguished its great climatic divisions under the characteristic names, which are still retained, of the *Tierras Calientes* (hot or littoral lands), *Tierras Templadas* (temperate lands), and *Tierras Frias* (cold or high lands). The mean annual heat of the *Tierras Calientes* is 77°; and the soil, which is generally fertile, produces maize, rice where water can be procured for irrigation, bananas, pine-apples, oranges, manioc; and sarsaparilla, jalap, and vanilla in the littoral swampy forests. This tract has only two seasons—the winter, or season of north winds, and the summer, or season of breezes. In the former, the hurricanes are the terror of navigators, but the coast is clear of yellow fever, which prevails in the hot season. On the medium elevations of the *Tierras Templadas*, the temperature is extremely equable, varying only from about 70° to 80° F.; the climate healthy, and wherever water is abundant, a perpetual summer reigns, yielding a varied and active vegetation, which embraces all the cereals, fruits, and vegetables of Central and Southern Europe, amongst which maize, oranges, lemons, grapes, and olives are produced in the most exuberant abundance. The *Tierras Frias*, which would scarcely have been characterised as cold by discoverers belonging to a less southern climate than Spain, possess a generally temperate climate, the mean annual heat ranging between 66° and 68° F.; but on the highest of the table-lands, the air is keener, and the soil more arid, and agriculture is limited to the cultivation of barley and of the agave, or Mexican aloe, which held the place of the vine among the ancient Aztecs, and is still extensively cultivated for the sake of its juice, which is made into the fermented drink known under the name of *pulque*. In addition to the vegetable products already referred to, M. yields coffee, tobacco—whose growth is, however, limited by governmental restrictions—yams, capsicums, pepper, pimento, indigo, ipecacuanha, dragon's-blood, copaiba, fan-palms, india-rubber trees, mahogany, rosewood, ebony, &c.

The products of the mines, which rank among the richest in the world, include the precious metals. The gold-mines of M. occur principally on the west side of the Sierra Madre, north of 24° n. lat., and, until the discovery of the metal in Australia, their yield surpassed the produce of any other part of the world. Silver mines abound in M., and the argentiferous veins, which may be said to intersect every part of the western declivities of the Andes, occur in some places, as in the *Veta Madre* lode at Guanajuato, in beds varying from 10 to 50 yards in depth; the precious metal being in these cases intermixed with sulphur compounds, antimony, and arsenic. But although these mines possess the additional special advantage of being situated in fertile districts, affording abundant food to miners and their cattle, their working has been very imperfectly carried on, owing to the unsettled state of the country. At the close of the last, and the beginning of the present century, the annual value of the gold and silver of M. was upwards of £8,000,000, of which 9-10ths were yielded by the silver; but the political disturbances, preceding and consequent on the wars of independence, have very considerably reduced this sum, which has probably never been reached since M. was finally separated from the mother-country. In addition to gold and silver, M. yields tin, antimony, mercury, copper, lead, iron, and zinc; while carbonate of soda, used in smelting silver, is found crystallised on the surface of several lakes, and occurs, together with common salt, in dry seasons, on the more arid parts of the surface of the elevated table-lands.

Cattle, horses, asses, mules, and sheep abound in M., where, in consequence of the extent and excellence of the pasture-grounds, all the domestic animals introduced from the Old World have multiplied excessively. Buffaloes feed in the lower plains; goats and sheep are plentiful; the tapir, wolf, American lynx, jaguar, wild-cat, several species of the skunk, the brown porcupine, stag, deer, &c., are to be found. Parrots, humming-birds, and wild game birds, including turkeys, are abundant; and almost all the lakes yield large quantities of fish. The cochineal insect and the silk-worm are reared with great success on the table-land of Mixtecapan.

*Commerce, &c.*—Notwithstanding the enormous advantages presented by her natural productions, and the important geographical position which she occupies between the Atlantic and the Pacific, M., owing to her unsettled government, and the consequent insecurity of life and property, has not been able to develop her

foreign commerce beyond the value of about 10 millions sterling. The precious metals constitute, it is estimated, nearly nine-tenths of the exports, the remainder being made up by productions of the soil, and industrial products, such as cotton, woollen, and silk goods, soap, leather, saddlery, gold and silver lace, cigars, brandy, &c. England, France, Hamburg and Lübeck, and the United States of America are the principal powers with which M. maintains relations of foreign commerce; while the city of Mexico is the chief focus of internal trade, and Vera Cruz the principal port for maritime commerce. The total value of the foreign trade of M. in 1853 was—for imports, £5,600,000; for exports, £5,100,000. For the number of ships entering and clearing the ports of M., see **VERA CRUZ** and **TAMPICO**. M. possesses about 400 miles of railway, the line from Vera Cruz to Mexico being one of the most wonderful pieces of engineering enterprise in the world. The annual traffic amounts to about 250,000 passengers, and 190,000 tons of freight. The financial condition of M. has been allowed to fall into such disorder since the establishment of independence, that the expenditure has been continually increasing beyond the receipts. According to the printed estimates, the estimated amount of the budget for 1855-6 was £4,760,000. The total expenditure for the same year was estimated at £4,950,000. The revenue is derived mainly from the customs. The total amount of the national debt cannot be stated. The loans contracted by the imperial government are entirely repudiated by the present government.

**Army, Navy, &c.**—In accordance with the old constitution of M., the standing army was to consist of 26,000 men, with a reserve of 65,000 men; but this number, which had fallen to nearly half the required force in 1855, has been so extensively reduced since that period by continual civil wars, that according to Spanish authorities, the government of the late President Juárez, on the breaking out of hostilities with the French in 1862, was unable to bring into the field more than 5000 infantry, 600 cavalry, and 9500 of the national guard. The total strength of the army is now estimated at about 20,000 men. The navy consisted of only some 300 men, while the fleet numbered only 9 small ships of war, carrying in all between 30 and 40 cannon. Education in M., long in the lowest possible condition, even among the wealthier classes, is now steadily improving. Liberal allowances have been made by the central and state governments for establishment of new schools, &c. In 1853 there were in M. nearly 4000 public schools, with about 190,000 scholars.

**Religion, &c.**—The Roman Catholic is the dominant church of M., but all other sects are tolerated. M. has 3 archbishops and 10 bishops. The administration of justice is not what it should be, but is not so inefficient, nor the courts so corrupt, as formerly. Brigandage and smuggling endanger personal security, and seriously damage the resources of the nation, but are gradually disappearing.

The supreme power of the state was, in 1858, vested in the hands of Benito Juárez, who was to bear the title of Constitutional President and administer public affairs in conjunction with a legislative congress, composed of a chamber of senators and a lower house of representatives. Each province was to elect two senators and one deputy to every 40,000 inhabitants, and was, moreover, to have a separate provincial legislative chamber, presided over by its governor. President Juárez is undoubtedly, along with General Iturbide, to be regarded as the most distinguished character in modern Mexico. The unfortunate Maximilian was a mere episode in the career of the country. A Provisional Regency of the Mexican Empire was appointed by the *Junta Superior del Gobierno*; which was itself constituted (16th June, 1863) by a decree of Marshal Forey, leader of the French army of invasion. It was composed of 85 members. This Junta at the same time established, under French influence, an *Assembly of Notables*, whom it charged with deciding in the name of the people what form of government M. should adopt. On the 10th of July 1863, this body, by an overwhelming majority, decided in favor of a constitutional hereditary monarchy, and that the new ruler should bear the title of Emperor of Mexico. See **MEXICO**. The present constitution dates from 1857. The executive power is vested in a president, elected by universal suffrage, for a period of 6 years. The legislative power is confided to a congress consisting of a House of Representatives (one for each 80,000 inhabitants), and a senate (with two members for each state).

**History of Mexico.**—The history of ancient M. exhibits two distinct and widely-differing periods, the former of which, that of the Toltecs, appears to have begun in

the 7th, and ended with the 12th c.; while the second, that of the Aztecs, began in the year 1200, and may be said to have been closed by the conquest of Cortes in 1519; for although the race has maintained occupation of the Mexican territory, its existence as a nation ceased with the Spanish domination. The origin and primitive seats of the Toltecs are shrouded in mystery; and all that we learn of this people is, that they came from the north, from some undefined locality, which they designated Tullan, and from whence they brought to the valley of Mexico the first elements of civilisation. Their laws and usages stamp them as a people of mild and peaceful instincts, industrious, active, and enterprising. They cultivated the land, introduced maize and cotton, made roads, erected monuments of colossal dimensions, and built temples and cities, whose ruins in various parts of New Spain still attest their skill in architecture, and sufficiently explain why the name Toltec should have passed into a synonym for architect. They knew how to fuse metals, cut and polish the hardest stones, fabricate earthenware, and weave various fabrics; they employed hieroglyphics for the record of events, were acquainted with the causes of eclipses, constructed sun-dials, devised a simple system of notation, and measured time by a solar year, composed of 18 months of 20 days each, adding 5 complementary days to make up the 365, and intercalating 12½ days at the expiration of every 5½ years, which brought them within an almost inappreciable fraction to the length of the tropical year, as established by the most accurate observations. These and other arts, with a mild form of religion, and a simple but just mode of administering the laws, the Toltecs bequeathed to the Aztecs, who engrafted upon the civilisation of their predecessors many fierce and sanguinary practices in their religions, and many puerile usages in their social life. Nothing is known of the exact time, and still less of the manner and causes of the departure of the Toltecs from M.; but it has been conjectured that they went towards the south, and that the colossal architectural remains of the cities of Palenque, Uxmal, and Mitla, in Central America, are the work of their hands. The Aztecs, as we have said, imparted to the institutions of the Toltecs a tinge of their own sombre cruelty, and produced an anomalous form of civilisation, which astonished the Spaniards by its mingled character of mildness and ferocity. Like the Toltecs and the Chichimeca, a rude tribe who had succeeded them, the Aztecs came from the north, and after wandering from place to place, founded in 1325 the city of Tenochtitlan, or Mexico. On the arrival of the Spaniards, their empire was found to extend from ocean to ocean, stretching on the Atlantic from 18° to 21° n. lat., and on the Pacific from 14° to 19° n. lat. Their government was an elective empire, the sovereign being selected from the brothers of the deceased prince, or, in default of them, from his nephews. Their laws were severe, but justice was administered in open courts, the proceedings of which were perpetuated by means of picture-written records.

The Aztecs believed in one supreme invisible creator of all things, the ruler of the universe, named *Taotli*—a belief, it is conjectured, not native to them, but derived from their predecessors, the Toltecs. Under this supreme being stood 13 chief and 200 inferior divinities, each of whom had his sacred day and festival. At their head was the patron god of the Aztecs, the frightful *Huitzilopochtli*, the Mexican *Mars*. His temples were the most splendid and imposing; in every city of the empire his altars were drenched with the blood of human sacrifice. Cortes and his companions (see *Drax*) were permitted by Montezuma to enter that in the city of Mexico, and to behold the god himself. "He had a broad face, wide mouth, and terrible eyes. He was covered with gold, pearls, and precious stones; and was girt about with golden serpents. . . . On his neck, a fitting ornament were the faces of men wrought in silver, and their hearts in gold. Close by were braziers with incense, and on the braziers three real hearts of men who had that day been sacrificed" (Helps' "Spanish Conquest in America," vol. II., book x., chap. 4). The smell of the place, we are told, was like that of a slaughter-house. To supply victims for these sacrifices, the emperors made war on all the neighboring and subsidiary states, or in case of revolt in any city of their dominions, and levied a certain number of men, women, and children by way of indemnity. The victims were borne in triumphal processions and to the sound of music, to the summit of the great temples, where the priests, in sight of assembled crowds, bound them to the sacrificial stone, and opening the breast, tore from it the bleeding heart, which was

either laid before the image of their gods, or eaten by the worshippers, after having been carefully cut up and mixed with maize. In the years immediately preceding the Spanish conquest, not less than 20,000 victims were annually immolated. These atrocities were incongruously blended with milder forms of worship, in which fruits, flowers, and perfumes were offered up amid joyous outbursts of song and dance. According to their mythology, Tzotl, who delighted in these purer sacrifices, had once reigned in Anahuac (a name which at first probably applied only to the country in the immediate vicinity of the capital, though afterwards it was applied to the whole Aztec empire) in the golden age of the world, but being obliged, from some unexplained cause, to retire from earth, he departed by way of the Mexican Gulf, promising to return. This tradition accelerated the success of the Spaniards, whose light skins and long dark hair and beards were regarded as evidences of their affinity with the long-looked-for divinity. The Mexican priesthood formed a rich and powerful order of the state, and were so numerous that Cortes found as many as 6000 attached to the great temple of Mexico. The education of the young of both sexes remained till the age of puberty in the hands of the priests and priestesses; and the sacerdotal class were thus able to exercise a widely diffused influence, which, under the later rulers, was almost equal to that of the emperor himself. The women shared in all the occupations of the men, and were taught, like them, the arts of reading, writing, ciphering, singing in chorus, dancing, &c., and even initiated in the secrets of astronomy and astrology.

On the arrival of Cortes, in 1519, the Aztec throne was occupied by Montezuma, an energetic prince, who, after his election to the throne, which for several generations had been occupied by his ancestors, made successful war on the powerful and highly-civilised neighboring state of Tlascala, and on Nicaragua and Honduras; after a time, however, he grew indolent, and alienated the affections of his subjects by his arrogance and exactions, and by his unremitting devotion to the services of the temples. According to the oracles which he frequently consulted, great changes were impending over the empire, the return of Quetzalcoatl was near at hand, and the fall of his race was impending. The tidings of the arrival on the coast of the expedition of Grigalva in 1518 terrified Montezuma and his priestly councillors; and when the hieroglyphic reports of his provincial officers announced the landing in the following year of Cortes and his companions, he endeavored to propitiate the dreaded strangers by sending an embassy charged with valuable gifts to meet them. The road to success was thus open to the Spanish captain, who, with a handful of men, advanced from St. Juan de Ulloa to M., and gradually subdued the entire empire of the Aztecs, whose power crumbled to dust before the greater energy and superior civilisation of their Christian invaders. In 1540, M. was united with other American territories under the name of New Spain, and governed by viceroys appointed by the mother-country. The intolerant spirit of the Catholic clergy led to the suppression of almost every trace of the ancient Aztec nationality and civilisation, while the strict system of sequestration enforced in M. crippled the resources of the colony; yet notwithstanding these drawbacks, M. ranked first among all the Spanish colonies in regard to population, material riches, and natural products. It may be said to have vegetated for nearly three centuries in a state of semi-quietude prosperity, interrupted by few disturbances of any kind until the year 1810, when the discontent, which had been gaining ground against the vice-regal power during the war of the mother-country with Napoleon, broke into open rebellion under the leadership of a country priest named Hidalgo. The defeat and subsequent execution of the latter in 1811 put a partial stop to the insurrection, but the atrocities committed under the sanction of the new viceroy, Calleja, exasperated the people, and gave an irresistible impulse to the revolutionary cause. Guerrero and Iturbide in turn gained signal advantages over the Spaniards. For a time, Iturbide maintained a self-established imperial rule over the colony; but on the downfall consequent on his tyrannical abuse of power, a constitutional mode of government was inaugurated, and in 1824 the independence of M., which had chosen a federal republican form of government, was finally established, and in the following year definitely recognised by every foreign power, except Spain. The Mexican war was stained with excesses and atrocities on both sides; but it must be confessed that the Spaniards gained an unenviable pre-eminence in regard to the wanton cruelty which characterised their method of

conducting hostilities. With them the war was one of extermination, every commander being allowed, at his own discretion, to hunt down and slaughter the insurgents like brutes. The welfare of the new republic was unhappily disturbed by constant outbreaks of civil war under the leadership of the *Escoscos*, or aristocratic faction, and the *Yorkinos*, or democrats; and the history of the quarter of a century during which M. has exercised independent power, leaves little to recount beyond ever-recurring acts of violence, and the rapid and summary deposition of one president after another. In 1836, Texas secured its independence of the Mexican republic, for which it had struggled for several years, and at the same period differences arose with France, which were, however, brought to a peaceful conclusion after the taking of Vera Cruz in 1838 by the French troops. In 1841, General Santa Anna, on the retirement of Bustamante, succeeded in regaining the direction of affairs, from which he had been more than once deposed, and under the title of Dictator, exercised the power of an autocratic ruler. In 1845, M. was compelled to recognise the independence of Texas, which was incorporated with the United States, whose troops having entered the Mexican territory, provoked a declaration of war on the part of the Mexican government. Hostilities were carried on with great energy by both parties until 1848, when peace was finally concluded, after several bloody engagements had been fought without any definite result on either side; and the city of Mexico had been stormed and taken by the Americans under General Scott. In 1852, after Santa Anna and Herrera had been in turn deposed and recalled to power, a revolutionary movement of more than ordinary importance brought General Cevallos for a time to the head of affairs; but, when the insubordination and arrogance of the soldiery threatened universal anarchy, Santa Anna was again recalled, 17th March 1853. Having reorganised the army, and suppressed by the most cruel severity the insurrection of the federals, he declared himself President for life, and thus again rekindled civil war. In 1855, he had to flee from the country. Since then, utter confusion has prevailed. Santa Anna was succeeded by General Alvarez, who held office for about two months, after whom came General Comonfort, who was forced to resign in 1858; when a General Zavago assumed supreme power, but was almost immediately deposed by a General Robles. This person also proving a futility, Benito Juarez was elected; but his claims were contested by General Miramon—the head of the priestly and conservative party—and the country was plunged in civil war. The acts of wanton aggression and flagrant injustice perpetrated on foreigners in M. during this period of internal disorder, during which the Cortes passed an act suspending all payments to foreigners for two years, could not fail to draw upon the Mexican government the serious remonstrance of those European powers whose subjects had just cause of complaint; and the result was to bring a fleet of English, French, and Spanish ships into the Mexican Gulf for the purpose of enforcing satisfaction. In December 1861, the British minister left M., and the Spaniards disembarked a force at Vera Cruz, and took possession of the fort of St Juan d'Ulloa, a step which was soon followed by the arrival before the former city of the allied fleet. A proclamation, signed by the commanders-in-chief of the three naval divisions, and addressed by them to the Mexican people, elicited no satisfactory reply; and steps were accordingly taken to advance at once upon the capital. This measure alarmed the provisional government of M., and brought about an armistice, with a view of negotiating a treaty for the future regulation of commercial intercourse between M. and the great European powers. This treaty was drawn up and provisionally ratified by the different commanders, but not confirmed on the part of France, and consequently the French troops retained occupation of the Mexican territory after the English and Spaniards had declined to join in further hostile demonstrations. In April 1862, the French emperor formally declared war against the government of Juarez, who had assumed arbitrary rule as president of the republic. The French, who spent £8,000,000 on the Mexican expedition, did not meet with the sympathy and welcome from the people at large which the assumed unpopularity of Juarez had led them to anticipate; and, although the taking of Puebla and other decided successes gave them a firmer footing in the country, it was evident that whatever grievances the Mexican nation had against their government, they entertained a deeply-rooted hatred against foreigners, and were certainly not prepared to welcome with cordial unanimity the thorough re-

organisation of their political system, which the European powers, with France at their head, were initiating for the country.

**MEXICO.** After the declaration of war against Juarez by the French, they issued a proclamation to the Mexican people, April 16, 1862, setting forth that one of the objects of the contest was to rescue them from the tyranny of the President, and put the government of the country on a stable footing. Little faith, however, seems to have been put in these professions; and the invaders, though joined by Marquez, the military leader of the clerical party, met with little success till the arrival of General Forey with a reinforcement from France in September. Forey then took the command in chief, addressed a proclamation to the Mexicans, promising them perfect liberty in the choice of a new government in room of that of Juarez; and in the spring of 1863, concentrated the French troops, and marched on Mexico. On his way, he took the strongly fortified city of Puebla after a two months' siege, capturing its defender, Ortega, and his whole force (May 18); and, Juarez having fled from the capital, and transferred the seat of his government to San Luis Potosí at their approach, the French entered Mexico on June 10. A fortnight afterwards, a provisional government, headed by General Almonte, was established, and an "Assembly of Notables," which was called (June 24) to deliberate upon the best form of government, decided in July, by a vote of 231 to 19, in favor of a "Limited Hereditary Monarchy," with a Catholic prince for sovereign, under the title of "Emperor of Mexico," and resolved in the first place to offer the crown to the Archduke Ferdinand Maximilian (q. v.) of Austria, failing whom, to request the good offices of the Emperor Napoleon in obtaining another monarch. That this resolution was the fruit of a general earnest wish on the part of the Mexican notables, the feeble and almost unwilling support most of them accorded to their chosen emperor after his desertion by the French, will not allow us to suppose; but, on the other hand, we have not the slightest reason for believing that anything approaching intimidation or undue influence was exercised by the French. Most of them doubtless argued that a government supported by France would be sufficiently powerful to maintain the country in a state of tranquillity, and in the hope of this long-wished-for result, cast in their lot for empire. These changes were, of course, vigorously protested against by the republican assembly at San Luis, and the two parties prepared with eagerness to try the fortune of war. On October 1, Forey departed from Mexico, and General Bazaine took the command of the French forces, and commenced the campaign with vigor. The result of the winter's struggle was that in spring the imperialists were in possession of the whole country, with the exception of the four northern provinces. October 3, 1863, the Archduke Maximilian had given audience at his château of Miramar, near Trieste, to a deputation which was sent to offer him the crown, and had accepted it. On May 22, the emperor and empress landed at Vera Cruz, and on June 12, made their public entry into the capital; and soon after the middle of the year, the imperialists had gained possession of every state in the kingdom, Juarez fleeing in August to the United States. As small parties of the republicans still maintained a species of guerrilla warfare in various districts, Maximilian, on October 2, 1865, published a proclamation, menacing with death, according to the laws of war, all who were found in armed opposition to his government; the republic having ceased, not only by the express wish of the nation, but also by the expiry (November 22, 1864) of Juarez's term of office, and his flight beyond the frontiers; the amnesty, however, being accorded to such as submitted before November 15. In accordance with this edict, Generals Arteaga and Salazar, who were defeated and captured, October 18, were shot on the 21st; and many hundreds of captured republicans were dealt with under the terms of the same order.

This contest in M. had from the commencement excited the liveliest interest in the United States, though the civil war, raging there also, prevented any active interference in the affairs of its neighbor. A general impression existed that France had taken advantage of the troubles of the United States to establish its authority firmly on the American continent; and this belief, along with the violation of the "Monroe doctrine" by the establishment of imperialism in M., induced the United States to give all their sympathy and diplomatic aid to Juarez and his supporters. In November 6, 1865, Secretary Seward forwarded a dispatch to Paris, in which it was stated that the presence of the French army in M. was a source of "grave re-

section" to the government of the United States, and that the latter could on no account allow the establishment of an imperial government, based on foreign aid, in M., or recognise in that country other than republican institutions. This dispatch led to an interchange of diplomatic notes during the following six months; the Americans holding firmly to their first statements, and even insinuating the probability of an armed interference on behalf of Juárez; till the French emperor, who was wearied with a contest so expensive and, though successful, so barren of lasting fruits, ultimately agreed, in the summer of 1866, to withdraw his troops from Mexico. The Belgian legion and some Austrian levies, however, were not included in this arrangement. Accordingly, from the autumn of 1866 till Feb. 1867, the French troops by degrees evacuated M., and their departure was the signal for a fresh rising on the part of the Juaristas. See **MAXIMILIAN** and **JUÁREZ**. The political condition of M. is still far from satisfactory.

**MEXICO** (City). Mexico, or Mejico, the capital of the republic, is situated in  $19^{\circ} 20'$  n. lat., and  $99^{\circ} 5'$  w. long., at an elevation of nearly 7500 feet above the level of the sea, in the valley of Tenochtitlan,  $2\frac{1}{2}$  miles west of Lake Tezcucó. The pop. was, in 1878, 230,000. This beautiful city, which is built on the site of the ancient Tenochtitlan of the Aztec empire, is situated on an extensive plateau, having an area of more than 1700 square miles, surrounded by lofty mountains, and including five lakes within its area. The principal streets, which all converge towards the great square of Mexico, are regularly and well laid-out, broad, clean, and well-paved and lighted; but the buildings, both private and public, are low, and of a light style of architecture, in consequence of water being found in many parts of the city at only a few feet below the surface, and partly from apprehension of earthquakes. The Plaza Mayor, one of the finest squares of the western world, contains the cathedral, a spacious and imposing building, erected on the ruins of the great *teocalli*, or temple of the Aztec god Mixtli, and adorned with the *kellenda*, a circular stone, covered with hieroglyphics, by which the Aztecs used to represent the months of the year. The palace of the Cortes, in the same square, consists of various buildings appropriated to offices of state, government schools, and public institutions of various kinds, but like everything else in Mexico, has been suffered gradually to fall to decay since the evacuation of the Spaniards. Mexico contains fourteen churches, some monasteries and convents, and numerous charitable institutions; the fine hospital has been converted into a barrack. There are schools of jurisprudence, medicine, agriculture, engineering, and an academy of the fine arts, containing valuable Aztec antiquities; also several theatres and a circus: the bull-ring was demolished in 1874. In addition to the ordinary *alameda* or public walk of a Spanish city, Mexico is remarkable for the extent and beauty of its *paseos*, or raised paved roads, planted with double rows of trees, which diverge far into the country from every quarter of the city. Mexico still boasts a few of the water-gardens for which the ancient city was so celebrated, and although no longer floating, as in the days of the Aztecs, they form attractive objects in the midst of the surrounding swamps, which, by the negligence of the Mexicans, have been suffered to increase in the vicinity of the lakes. The trade of Mexico is chiefly a transit-trade, although it has a few manufactures, as cigars of superior quality, gold-lace, hats, carriages, saddlery, &c.; and these articles, together with gold and silver, and some of the numerous valuable natural products of the Mexican plain, it transports, chiefly by means of mules, to Vera Cruz and other ports, importing in return the manufactured goods of Europe and various colonial products.

**MEXICO**, Gulf of, a basin of the Atlantic Ocean, the estimated extent of which is 800,000 English square miles, is closed in by the United States on the north, by Mexico on the west and south, and its outlet on the east is narrowed by the jutting peninsulas of Yucatan and Florida, which approach within 500 miles of each other. Right in the middle of this entrance is planted the island of Cuba, dividing the strait into two—the Strait of Florida, 120 miles wide, between Cuba and Florida, and the Strait of Yucatan, 105 miles wide, between Cuba and Yucatan. The former or northern entrance connects the Gulf with the Atlantic Ocean; the latter or southern, with the Caribbean Sea. The depth of water is supposed nowhere to exceed three-fourths of a mile, yet the gulf contains few islands—the Florida Keys, the deltas of the Mississippi, and a few on the coast of Yucatan, being the most import-

ant of them. The shores, which are very sinuous, form numerous bays, the largest of which is the Bay of Campeachy (q. v.). The coasts are mostly low and sandy or marshy, and are laved with numerous lagoons; good harbors are consequently not numerous, the best being those of Vera Cruz, New Orleans, Pensacola, and Havana. The gulf is visited by violent northern gales called *nortes*, which prevail from September to March, when they attain their maximum force, and then immediately terminate. The most remarkable feature in connection with the Gulf of M. is the *Gulf Stream* (q. v.), which enters it by the southern channel, passes round it, and emerges through the Strait of Florida. Owing partly to the presence of this heated current, the temperature of the gulf is  $8^{\circ}$  or  $9^{\circ}$  higher than that of the Atlantic in the same latitude.

**MEYERBEER**, Jakob, commonly called Giacomo Meyerbeer, a celebrated musical composer of the present age, was the son of a wealthy Jewish banker, and was born at Berlin, September 5, 1794. He was a precocious child, playing tunes on the piano spontaneously (it is said) as early as his fifth year. He began to study dramatic composition under Bernhard Anselm Weber; and in 1810 entered the school of Vogler at Darmstadt, where he formed an intimate friendship with the renowned Karl Maria von Weber. While at Darmstadt, he wrote a cantata, "Gott und die Natur." Subsequently, he composed an opera, "Jephthah," produced at Munich in 1812; but though warmly admired by his friends, Vogler, Weber, and others, it fell flat on the audience, and was considered a failure. He now proceeded to Vienna, where he acquired a brilliant reputation as a pianist; but another opera which he produced here by command of the court, "Die beiden Knechten," was no more successful than the previous one. Italian music was the rage at the time, and nobody had a chance who did not imitate Rossini. M. was induced by his friend Salieri to visit Italy, where he became an enthusiastic convert to the new Italian school, and began the composition of a series of operas which proved highly popular. We may mention his "Romilda e Costanza," (performed at Padua in 1819), "Semiramide" (Turin, 1819), "Emma di Resburgo" (Venice, 1820), the first of M.'s compositions that excited a furor; "Margherita d'Anjou" (1822), "Esule di Grenada" (1823), and "Crociato" (Venice, 1825). The last of these afforded, perhaps, the most decisive proofs of the high genius of its author, and was received with great applause in Paris, whither M. now proceeded, and took up his residence. In 1831, was produced, after numerous rehearsals, his "Robert le Diable," which caused an excitement "perhaps unparalleled in the history of the Parisian stage;" while it was received with nearly as great enthusiasm in England, Italy, Austria, and Russia; and in 1836, "Les Huguenots," in which he reached the climax of his fame. His next opera, "Le Prophète" (1849), fairly sustained his reputation. It was followed by "Pierre le Grand" (1854), "Dinorah" (1858), and "L'Africaine" (1865). M. died on May 2, 1864.

**MEZEN**, or Mezene, a district town in the government of Archangel, European Russia, 50 miles from the mouth of the river of the same name, remarkable for the salmon and herring fisheries which supply St Petersburg with frozen fish during winter. Pop. (1867) 1746.

**MEZEN**, or Mezene, a river in the north of European Russia, rises in the north of the government of Vologda, and flows north-west into the White Sea, having a course of about 450 miles.

**MEZIERES**, a fortified town of France, capital of the dep. of Ardennes, on the right bank of the Meuse, on the isthmus of a promontory formed by the river, which washes its walls on two sides, and separates it from Charleville (q. v.). It was strongly fortified by Vauban, and is defended by a citadel. It communicates with Charleville by a suspension-bridge. In 1815, the town held out for two months against the Allies, who besieged it after the battle of Waterloo. Over the north side of the church is a bomb-shell, which has been sticking there ever since the town capitulated. In 1520, the Chevalier Bayard, with 2000 men, successfully defended it against 40,000 Spaniards under Charles V. In the Franco-German war of 1871, M. capitulated after a cannonade of two days. Pop. (1876) 5204.

**MEZŐ-TÚR**, a town of Hungary, on the Berettyó, an affluent of the Körös, 60 miles south-west of Debreczen. Pottery is made, and there is an important market. Pop. (1867) 20,447.

Mezquite  
Miasma

48

**MEZQUITE**, the name of two Mexican trees or shrubs, of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, bearing pods filled with a nutritious pulp. The **COMMON M.** (*Algarobia glandulosa*) is a small shrub, with stems often decumbent, and armed with strong straight spines. It is found in great profusion throughout vast regions, chiefly consisting of dry and elevated plains. In dry seasons, it exudes a great quantity of gum (*Gum Mezquite*), similar in quality to gum-arabic, which seems likely to become a considerable article of commerce, and which has begun to be exported to San Francisco from the Mexican ports on the Pacific.—The **CURLY M.**, or **SCREW M.** (*Strombocarpa pubescens*), also called **SCREW BEAN** and **TOURNIL**, although only a shrub or small tree, is of great value in the wild and desert regions of the western part of North America, where it occurs along with willow-brushes near springs of water. Its wood is used as fuel, and the pulp of its pods for food. The pods are spirally twisted into compact rigid cylinders, from an inch to an inch and a half in length.

**MEZZOFANTI**, Giuseppe, Cardinal, a remarkable linguist, was born, 17th September 1774, at Bologna, where he received his education, and subsequently (1815) received the office of university librarian. In 1831, he settled in Rome, and was advanced to the dignity of a Monsignore; in 1833, he was appointed secretary of the College of the Propaganda; then keeper of the Vatican Library; and in 1838, he was raised to the dignity of cardinal. He died, 15th March 1849, at Rome. M.'s European reputation was founded, not on any literary or learned works that he wrote, but on the almost miraculous extent of his linguistic acquisitions. Towards the end of his life, he understood and spoke fifty-eight different tongues. As early, indeed, as 1820, Lord Byron called him "a walking polyglott, a monster of languages, and a Briareus of parts of speech." He was not in the strict sense a critical or scientific scholar; yet, although his linguistic skill lay chiefly in verbal knowledge, his acquirements in other departments were by no means inconsiderable. See Russell's "Life of Cardinal Mezzofanti" (Lond. 1858).

**MEZZOTINTO**. See ENGRAVING.

**MEZZOJU'SO** (Arab. *Menzil-Jusuf*, village of Joseph), a town of Sicily, in the province of Palermo, 18 miles south-south-east of Palermo city. It is one of the four colonies of Alibaulans, who, on the death of Scanderbeg, in the 15th c., fled to Sicily, to avoid the oppression of the Turks. They preserve their language to a great extent, and follow the Greek ritual, their priests being allowed to marry; but, except on fête-days, they are not to be distinguished in feature or dress from the peasantry of the rest of Sicily. Pop. 5700.

**MGLIN**, a town of Russia, in the government of Tchernigov, 125 miles north-north-east of the town of Tchernigov. There is a large cloth-factory, and a considerable number of German families. Pop. (1867) 5842.

**MHENDIGU'NJ**, a town of British India, in the territory of Onde, 90 miles south-east of Lucknow, 3 miles south of the right bank of the river Saeel. It is a busy, thriving place, with a pop. estimated at 20,000.

**MHOW**, a town of British India, in the territory of Indore, 13 miles south-west of the town of Indore, near the Vindhyan Mountains, on an eminence on the Gumber river. Near it are the cantonments, which have altogether the appearance of a European town, having a church with steeple on an eminence, a spacious lecture room, a well-furnished library, and a theatre. They are situated at an elevation of 2019 feet above the sea, and are occupied by a considerable force. On the 1st July 1857, the sepoys mutinied here, during the great rebellion of that year.

**MIAGAO**, a town in the island of Panay, one of the Philippine Isles, in the province of Iloilo. The inhabitants, who are industrious, comfortable, and well educated, are estimated at 81,000 in number.

**MIA'KO**, or **Kioto**, now called **SAR-KIYO**, the ancient capital of Japan, situated in the s. w. of the island of Nipon. Broad and clean streets cross each other at right angles, and the houses are mostly of the better class. During the double rule in Japan, it was the residence of the Mikado, then only the spiritual emperor, and was and is the stronghold of the national religion. Some of the temples are of

great size and splendor. In 1868, the great revolution broke out: the Shogun, or temporal ruler, was deposed, and the Mikado, who was now invested with complete authority, both temporal and spiritual, removed his court to Yedo. Most of the aristocratic dwellings are consequently tenanted, and the population in 1876 was only 374,496. M. is still, however, the seat of considerable trade with the interior. It is also a centre of Japanese literature and art, and is well provided with public schools for boys and girls, besides special provision for instruction in English, French, and German. It is famed for the manufacture and dyeing of silks.

MIA'MI, a river of Ohio, United States of America, rises by several branches in the western centre of the state, and after a south-south-west course of 150 miles through one of the richest regions of America, and the important towns of Dayton and Hamilton, empties itself into the Ohio River, 20 miles west of Cincinnati. It is sometimes called the Great M., to distinguish it from the Little M., a smaller river, which runs parallel to it, 15 to 25 miles east, through the Miami Valley.

MIA'SMA (Gr. pollution; in the plural, *Miasmata*), or Malaria. It is proved by the experience of all ages that there is an intimate connection between malarial districts and certain diseases, especially the various forms of intermittent and remittent fever; but the exact nature of the noxious agent, and the circumstances on which its formation and extrication depend, are even at the present day not altogether established. It is clearly neither heat nor moisture, for the crews of clean ships, when cruising in the tropics at a distance from land, are usually very healthy; nor is it any known gas extricated from the marsh, for the gases collected by stirring up marshes (carbonic acid, nitrogen, oxygen, and carburetted hydrogen) may be inspired without giving rise to any symptoms resembling those produced by malaria. It may be regarded as an established fact, that the noxious agent is a product of vegetable decomposition occurring under certain conditions of heat and moisture. That vegetable decomposition is the source of the poison, is inferred from various circumstances. For example, this special morbid influence is nowhere so powerful as in the deltas and along the banks of large tropical rivers which, in their flood bring down the washings of the soil, full of vegetable remains, which, upon the subsidence of the waters, are left reeking in the hot sun. Again, the poison has been traced, in various places in Italy, France, and the Netherlands, to the practice of steeping flax in stagnant waters, and even in streams; and in India, it was formerly the custom, after extracting the coloring matter, to throw the remains of the indigo into large heaps, which, in the course of three years, became excellent manure: it was found, however, that these heaps, alternately soaked by the heavy rains and heated by a tropical sun, decomposed and emitted miasmata precisely similar in their effects to those produced by marshes. Marsh-miasmata are seldom evolved at a temperature under 60°, but at and above 80° they are prevalent and severe; and the nearer we approach the equator, the more violent, as a general rule, do they become. Although moisture is necessary to the evolution of miasmata, an excess of it often acts as a preventive, and by impeding the access of atmospheric air, retards or prevents decomposition. This explains the apparent anomaly of an uncommonly rainy season producing opposite effects in different localities, sometimes not far distant from one another. Thus, in the West Indies, a very rainy season induces general sickness in the dry and well-cleared island of Barbadoes; while at Trinidad, whose central portions are "a sea of swamp," and where it rains nine months in the year, the excessive rain is a preservative from sickness; for in the seasons when rain falls only eight months or less, the swamps become dry and exposed to the sun, and severe remittent fevers are sure to follow.

Chemistry has hitherto failed in detecting any special ingredient to which the air evolved by marshes owes its poisonous qualities. The air collected in the most poisonous districts gives, on analysis, the same gases existing in the same proportions as normal air, nor (if we except the observations of Boussingault, which have not been confirmed by other chemists) does it give evidence of the presence of any organic body.

The infecting distance of this poison is a subject of great practical importance; and both the altitudinal range and the horizontal spread have to be noticed. In Italy, it is estimated that an altitude of about 1500 feet assures an exemption from marsh-poison; while in the West Indies, an elevation of at least 2000 feet is neces-

**Miasme**  
**Michael**

50

sary. From observations made by Sir Gilbert Blane during the ill-fated Walcheren expedition, it appears that, in Europe, the horizontal spread of marsh-miasmata over fresh water is less than 3000 feet; but over salt water—at all events, in the tropics—the horizontal range is greater. The extent to which the poison may spread horizontally over land, is a much more complicated question, and depends, to a great extent, upon the nature of the soil. The effect of trees in intercepting miasmata is very remarkable, and is probably due partly to their condensing the vapors of the marsh, and partly to their altering the direction of the current of air. Pope Benedict XIV. caused a wood to be cut down which separated Villatri from the Pontine Marshes, and in consequence, for many years, there was a most severe and fatal fever in a district previously healthy; and the same results have in many other cases followed the removal of trees.

In districts where this poison exists, it is found by experience that those who go out of their houses only during the day, after the morning fogs have dispersed, and before the evening mists appear, often escape the bad effects; and a full meal, with a few grains of quinine, should be taken before exposure to the morning air by travellers in a malarious district.

Dr Wood of Philadelphia has pointed out the extraordinary and very important fact, that miasmata are neutralised, decomposed, or in some other way rendered innocuous by the air of large cities. Though malarious diseases may rage around a city, and even invade the outskirts, yet they are unable to penetrate into the interior, and individuals who never leave the thickly-built parts almost always escape. What it is in the air of the city which is thus incompatible with malaria, is unknown; but very probably it is connected with the results of combustion, for the fire and smoke of camps are asserted to have had the same effects.

**MIAUTSE**, the aborigines or hill-tribes of China. From the dawn of Chinese history, we find the people of the plains contending against those of the high lands, and to the present day the hardy mountaineers have maintained their independence. They consist of numerous tribes, occupying large portions of Kwang-se, Kweichow, Yun-nan, Sze-chuen, and adjacent provinces. Some of them own Chinese sway; other tribes are absolutely independent. They are smaller in size and stature, and have shorter necks, and their features are somewhat more angular than the Chinese. Their dialects are various, and wholly different from the Chinese. Dr Macgowan describes them as skilful in the manufacture of swords. He has shown that the M. of Western China and the Karens or hill-tribes of Burmah are identical.—Reports of Dr Macgowan's Lectures.

**MIAVA**, a market-town of North-west Hungary, on the Miava, an affluent of the Morava, 43 miles east-north-east of Presburg city. There are manufactures of woollen cloth and bagging, and hemp and flax are cultivated. Pop. (1869) 9637.

**MICA** (from the same root with Lat. *mico*, to glitter), a mineral consisting essentially of a silicate of alumina, with which are combined small proportions of silicates of potash, soda, lithia, oxide of iron, oxide of manganese, &c., according to which and the somewhat varying external characters, numerous species have been constituted by mineralogists. **COMMON M.**, also called **POTASH M.**, contains a notable but variable proportion of silicate of potash; it contains also a little fluorine. It is a widely diffused and plentiful mineral, entering largely into the composition of granite, mica-slate, and some other rocks, veins and fissures of which it also often fills up. It has a strong, and often almost metallic lustre. It is remarkable for the readiness with which it splits into thin elastic plates, which are generally transparent. The thinness and elasticity of these plates readily distinguish them from those of talc, and of the laminated variety of gypsum; they are also devoid of the greasy feel of talc. They are sometimes not more than one 800,000th part of an inch in thickness, are generally quite transparent, and are therefore much used in setting objects for the microscope. Plates of M. of large size are also used in Siberia, Peru, and Mexico as a substitute for glass in windows. Large plates, often a yard in diameter, are found in these countries, and in Norway and Sweden. M. is advantageously substituted for glass in lanterns, as it bears sudden changes of temperature better than glass, and in ships-of-war, as it is not liable to be broken on the discharge of cannon. Another use of M. is for making an artificial *avanturine*; it is also employed in a powdered state to give a brilliant appearance

to walls, and as a sand to sprinkle on writing. In the state of a very fine powder, it is known as *Cat's Gold* or *Cat's Silver*, according to its color. It is usually colorless, but sometimes white, gray, green, red, brown, black, and rarely yellow, owing to the presence of iron, manganese, chrome, fluorine, &c., in its composition. It is sometimes found in beautiful crystals, which are generally rhombic or six-sided tables—*LITHIA M.*, or *LEPIDOLITE*, contains lithia in small proportion. It is often of a rose color, or a peach-blossom color. It is used for ornamental purposes. It is found in several places in Britain.—*MAGNEsia M.*, or *BIOTITE*, contains about as much magnesia as alumina. It is often dark green.

*MICA-SCHIST* is, next to gneiss, one of the most abundant of the Metamorphic Rocks (q. v.). It consists of alternate layers of mica and quartz, but is sometimes composed almost entirely of the thin and shiving plates or scales of mica, and from this it passes by insensible gradations into clay-slate. The quartz occurs pure in thin layers like vein quartz. Garnets are in some districts abundant in this rock, making up a large proportion of the whole mass. Mica-schist is believed to be a highly altered shale or clay deposit, and the component minerals, including the garnets, to have been developed under the influence of metamorphic action from materials already existing in the unaltered strata. In many places, the mica-schist has a finely corrugated or wavy structure.

*MICAH*, the sixth (third in the lxx.) of the twelve minor prophets (Micah: Who is like unto Jah?), probably a native of Moresheth, prophesied during the reigns of Jotham, Ahaz, and Hezekiah, and was therefore contemporary with Isaiah, and Hosea, and Amos.—The Book of M. is regarded as divisible into three parts, each commencing with "Hear ye," organically connected, however, with each other, and shewing even a progressive development of idea in the mind of the writer. The destruction of Samaria (Israel), the danger and subsequent captivity of Judah; the wickedness of the rulers, the punishments that overtake the land, the glorious restoration of the theocracy; Jehovah's "controversy with his people" on account of their sins, his warnings, his exhortations, and his sublime promise of forgiveness, form the principal points of M.'s prophecies, which relate to the invasions by Sennacherib, Sennacherib, the Babylonian exile, the return, and the re-establishment of the theocracy under Zerubbabel. The style of M. is clear, vivid, concise, yet richly poetical; some passages, especially in the beginning and the last two chapters, are among the noblest in the Old Testament. The play upon words noticeable in Isaiah is also a marked feature of this writer.

*MICHAEL ANGELO (BUONAROTTI)*, who, in an age when Christian art had reached its zenith, stood almost unrivalled as a painter, sculptor, and architect, was born in 1474 at Chiusi, in Italy. He was of noble origin, having descended on his mother's side from the ancient family of Canossa, in Tuscany, while the Buonarrotti had long been associated with places of trust in the Florentine republic. M. A. learned the rudiments of painting from Bertoldo, a pupil of Domenico Ghirlandajo; and having been admitted as a student into the seminary which was established by Lorenzo the Magnificent for the study of ancient art in connection with the collections of statuary in the Medicean Gardens, he attracted the notice of Lorenzo by the artistic skill with which he had restored the mutilated head of a laughing faun, and was received into the palace of the Medici, where he spent several years. Lorenzo's death in 1492, and the temporary reverses which befell the Medici family in consequence of the incapacity of his successor, Piero, led M. A. to retire to Bologna, whence he soon removed to Rome, whither his fame had preceded him. His earliest original works were a Kneeling Angel, executed for the grave of St Dominic, at Bologna; the statues of Bacchus and David at Florence; and a magnificent group representing the "Mater Dolorosa," which was placed in St Peter's at Rome. Next in order of time, and, according to some of his contemporaries, first in merit, ranks M. A.'s great cartoon for the ducal palace at Florence, which, together with the pendant executed by Leonardo da Vinci, has long since perished. This work, which represented a scene in the wars with Pisa, when a number of young Florentines, while bathing in the Arno, are surprised by an attack of the Pisans, shewed so marvellous a knowledge of the anatomical development of the human figure, and such extraordinary facility in the powers of execution, that it became a study for artists of every land, and by its excellence created a new era in art. Pope Julius II. called

Michael  
Mich. gan

52

M. A. to Rome, and commissioned him to make his monument, which was to be erected within St Peter's. Although this work was never completed on the colossal scale on which it had been designed, and was ultimately erected in the church of St Pietro ad Vincula, it is a magnificent composition, and is memorable for having given occasion to the reconstruction of St Peter's on its present sublime plan, in order the better to adapt it to the colossal dimensions of the proposed monument. The pope insisted upon M. A. painting with his own hand the ceiling of the Sistine Chapel, and although unwillingly, he began in 1509 and completed within less than two years his colossal task, which proved one of the most marvellous of his works. The subjects of these cartoons are taken from the book of Genesis, while between these and the representations of the persons of the Saviour's genealogy are colossal figures of prophets and sibyls. M. A.'s genius was too often trammelled by the unworthy tasks in which Leo X. and successive popes engaged him, the former having employed him for years in excavating roads for the transportation of marble from Carrara, and in other ignoble labors. The Florentines and Bolognese vied with the pontiffs in trying to secure his services; and to his skill as an engineer Florence was indebted for the plans of the fortifications by which she was enabled for a prolonged time to resist the attempts of the Medici to recover possession of the city after their expulsion from it. On the surrender of Florence, he returned to Rome, where his great picture of the Last Judgment was painted for the altar of the Sistine Chapel. This colossal fresco, nearly 70 feet in height, which was completed in 1541, was regarded by contemporary critics as having surpassed all his other works for the unparalleled powers of invention and the consummate knowledge of the human figure which it displayed. After its completion M. A. devoted himself to the perfecting of St Peter's, which, by the touch of his genius, was converted from a mere Saracenic hall into the most superb model of a Christian church. He refused all remuneration for this labor, which he regarded as a service to the glory of God. M. A. died in 1563, at Rome, but his remains were removed to Florence and laid within the church of Santa Croce. His piety, benevolence, and liberality made him generally beloved; and in the history of art, no name shines with a more unsullied lustre than that of Michael Angelo.—See Vassari's "Vite de' Pittori" (Eng. trans), and "Lives" by Dappa (1806), Harford (1857), and Wilson (1876).

MICHAEL VI., surnamed PALÆOLOGUS, emperor of Constantinople. See PALÆOLOGUS.

MICHAELIS, Johann David, one of the most eminent and learned biblical scholars of the 18th c., was born on 27th February 1717, at Halle, where his father, Christian Benedict Michaelis, a theologian and orientalist of some distinction, was a professor. After completing his studies at his native university, he travelled in England and Holland, where he made the acquaintance of several celebrated scholars. In 1745 he became a professor of philosophy at Göttingen, and took an active part in the formation of a scientific association there. From 1753 to 1770, he was one of the editors of the "Göttinger gelehrten Anzeigen," and for some years he filled the office of librarian to the university. During the Seven Years' War, he was occupied in making preparations for an expedition of discovery in Arabia, which was afterwards made by Niebuhr. In the latter years of his life, he was almost always in the professorial chair or at his desk. He died on 22d August, 1791. M. was a man of vast attainments in history and archaeology, and his labors were of great importance in the departments of Biblical Exegesis and History. He may be regarded as among the earliest of the critical school of German theologians, but he lived at too early a period to acquire anything like a consistent or systematic theory of the genesis of the Hebrew Scriptures. He loved to rationalise in details, and was never quite certain what to think about inspiration; at all events, he seeks constantly to prove how thoroughly *human* the Mosaic legislation was, though he does not exactly deny its claims to being considered a Divine revelation. Many of his pupils became professors, and disseminated his principles through the German universities.

M.'s chief works are his "Einleitung in die göttlichen Schriften des Neuen Bundes" (2 vols. Göt. 1750; English by Bishop Marsh); his "Mosaisches Recht" (6 vols. Frankf. 1770—1775; English by Dr Alexander Smith, 1814); and his

"Moral" (3 vols. Gött. 1792—1822). See his "Lebensbeschreibung von ihm selbst abgefasst" (Hirtel und Leip. 1798).

**MICHAELMAS DAY.** See **ASTER**.

**MICHAELMAS DAY**, one of the English quarter-days for payment of rent by tenants—viz., 29th September. Michaelmas term is one of the four legal terms during which the English courts of law and equity sit daily for despatch of business. It begins on the 2d, and ends on the 25th November. Michaelmas Head Court is the name given in Scotland to the annual meeting of heritors or freeholders of each county to revise the roll of freeholders, the duties being now discharged by the Commissioners of Supply.

**MICHELET, Jules**, a brilliant French historian, born at Paris 21st August 1798. He studied with great success under Villemain and Leclerc, and at the age of 23 became a professor in the Collège Rollin, where he taught history, philosophy, and the classics. In 1826, he published "*Les Tableaux Synchroniques de l'Histoire Moderne*," and was named Master of Conferences (*Maître des Conférences*) at the *École Normale*. After the revolution of 1830, he was chosen head of the historic section, intrusted with the care of the archives of the kingdom, assistant to Guizot at the Sorbonne, and tutor to the Princess Clémentine, daughter of the French king, and published several valuable books, such as "*Précis de l'Histoire Moderne*" (1838, of which there have been more than 20 editions), "*Précis de l'Histoire de France jusqu'à la Révolution Française* (the 7th edition of which appeared in 1842), "*Mémoires de Luther*" (1835), "*Origines du Droit Français cherchées dans les Symboles et Formules du Droit Universel*" (1837). In 1838, he succeeded Daunou in the Collège de France, and Comte Reinhard in the professorship of Moral Philosophy. He now plunged into controversy with all the vivacity and impetuosity of his nature. The Jesuits were the grand objects of his dislike; and eloquence, sarcasm, sentiment, and history were all brought to bear upon them with brilliant effect. Three books were the fruits of his polemic: "*Des Jésuites*, in conjunction with Edgar Quinet" (1843); "*Du Prêtre de la Femme, et de la Famille*" (1844); "*Du Peuple*" (1846). In 1847 appeared the first volume of his "*Histoire de la Révolution*;" and it was finished in 1853, in 6 vols. When the affair of 1848 broke out, acting more wisely than most of his learned *confrères*, he declined to take an active part in political struggles, and quietly pursued his literary avocations. He, however, lost his situation in the Archives Office after the *coup d'état*, by refusing to take the oath of allegiance to Louis Napoleon. Other works of his were "*L'Oiseau*" (1856), "*L'Insecte*" (1857), "*L'Amour*" (1858), and "*La Femme*" (1859); "*La Mer*" (1861), "*La Sorcière*" (1862), "*La Bible de l'Humanité*" (1864); and "*Nos Fils*" (1866) a plea for compulsory education. His master-piece is his "*Histoire de France*," continued in "*Histoire de la Révolution Française*, and "*Histoire du XIX<sup>me</sup> Siècle*. M. died in 1874.

**MICHIGAN**, one of the United States of America, lying in lat. 41° 40'—48° 20' n., and long. 82° 25'—90° 34' w. It is bounded on the n. by Lake Superior and St Mary's River; e. by Lake Huron, River and Lake St Clair, Detroit River and Lake Erie; s. by the states of Ohio and Indiana; and w. by Lakes Michigan and Wisconsin, and has an area of 56,243 square miles, or 35,995,520 acres. It is divided into 77 counties. The capital is Lansing; the chief towns are Detroit, Grand Rapids, East Saginaw, Jackson, Bay City, Saginaw City, &c. M. is divided by Lakes Michigan and Huron into two irregular peninsulas—the upper, a wild and rough region of mountains and forests, containing about one-third the area of the state, lies between the northern portions of Lakes Michigan and Huron, and Lake Superior; while the lower is nearly enclosed in a vast horse-shoe bend of Lakes Michigan, Huron, Erie, and the connecting straits and rivers. In the upper peninsula are the Porcupine Mountains, rising to a height of 2000 feet, with sandy plains and forests. The southern is a level, rich, fertile country of prairies and oak-openings, watered by numerous rivers, as the Grand, Kalamazoo, Muskegon, Saginaw, &c. The lower peninsula is of limestone strata, with coal and gypsum; the upper, of azoic formations, with metamorphic slates, gneiss rocks, trap, and rich mines of copper and iron. The climate is mild in the southern, and cold and bleak in the northern regions. The southern portion produces wheat, maize, fruits, butter, cheese, and wool in great

abundance. Vast quantities of pine-lumber are exported from the northern half of the state. The principal manufactures are flour and woollens. The extensive coast and rivers afford great facilities to navigation, while several railways traverse the state. The government is similar to those of the other states, and the school-system is based on that of Prussia, with abundant revenues from public lands. The university of M. at Ann Arbor has 44 professors, and a foundation of 1,000,000 acres of land. The only charge to students who are resident in M. is 10 dollars admission, and 15 dollars annual fee. Detroit was settled by the French in 1610, who also established a trading port at Mackinaw at about the same period. The British took Detroit in 1812, but restored it at the end of the war. The state was admitted to the Union in 1837. Pop. in 1840, 212,267; in 1850, 397,654; in 1880, 1,689,987.

**MICHIGAN**, a lake in the United States of America, the second in size of the five great fresh-water lakes, and the only one lying wholly in the United States, having Michigan on the n. and e., and Wisconsin on the w. It is 390 miles long, 70 miles in mean breadth, and 1000 feet in mean depth. It is 578 feet above the level of the sea, and has been found by accurate observations to have a lunar tidal wave of three inches. It is the outlet of numerous rivers, and is connected by a canal, and sometimes by flooded rivers, with the Mississippi, which is believed to have been its ancient outlet. Its principal harbors are those of Chicago, Milwaukee, and Grand Haven; and its bold and, at certain seasons, dangerous shores are guarded by 23 light-houses. It forms, with the lower lakes and the St Lawrence, a natural outlet for one of the richest grain-growing regions in the world.

**MICROCOSM AND MACROCOSM.** The belief, current in ancient times, that the world or cosmos was animated, or had a soul (see *ANIMA MUNDI*), led to the notion, that the parts and members of organic beings must have their counterparts in the members of the cosmos. Thus, in a hymn ascribed to Orpheus, the sun and moon are looked upon as the eyes of the animating godhead, the earth and its mountains as his body, the ether as his intellect, the sky as his wings. The natural philosophers of the 16th c.—Paracelsus at their head—took up this notion anew in a somewhat modified shape, and considered the world as a human organism on the large scale, and man as a world, or cosmos, in miniature; hence they called man a *microcosm* (Gr. little world), and the universe itself, the *macrocosm* (great world). With this was associated the belief, that the vital movements of the microcosm exactly corresponded to those of the macrocosm, and represented them, as it were, in copy; and this led naturally to the further assumption, that the movements of the stars must exercise an influence on the temperament and fortunes of men. See **ASTROLOGY**.

**MICROCOSMIC SALT** is a tribasic phosphate of soda, oxide of ammonium, and water, which crystallises with 8 equivalents of water, its formula being  $\text{NaO}, \text{H}_4\text{NO}, \text{HO}, \text{PO}_5 + 8\text{Aq}$ . It is prepared by mixing a hot solution of 6 parts of phosphate of soda with a concentrated solution of 1 part of muriate of ammonia, when the microcosmic salt crystallises in large transparent prisms, while common salt remains in solution. On the application of heat, it first loses its water of crystallisation, and then its oxide of ammonium and basic water, so that only metaphosphate of soda remains, which, from its ready fusibility into a colorless glass, is valuable as a flux in blow-pipe experiments. See **BLOW-PIPE**. This salt occurs in decomposed urina.

**MICROMETER** (Gr. *metros*, little; *metron*, measure) is an instrument used for the measurement of minute distances and angles. Its different forms, depending on different principles, may be divided into two sections, according as they are applied to Physics or Astronomy. Of the former section are the Vernier (q. v.) and the Micrometer Screw, the latter instrument being merely a screw with a very regular thread, and a large round head, which is carefully graduated, generally to sixtieths, and furnished with an index. It is easily seen that if a complete turn of the screw advance its point 1-20th of an inch, a turn sufficient to pass the index from one graduation to another will only advance it 1-1200th of an inch, &c. This is the micrometer used in the construction and graduation of instruments. Of those applied to astronomical purposes, the most simple is a short tube, across the opening of which are stretched two parallel threads, which are moved to or from each other by screws. These threads are crossed by a third perpendicularly, and the whole ap-

paratus is placed in the focus of a lens. The distance of two stars is found by adjusting the two parallel threads, one to pass through the centre of each star, taking care that the threads are placed perpendicular to the line joining the stars, and finding how many turns and parts of a turn of the screw are required to bring the wires to coincide. The angle of position of two stars is also obtained by turning round the instrument till the third wire, which is normally horizontal, bisects both stars, and reading off on the circumference the arc passed over. *Fraunhofer's suspended annular micrometer* consists merely of a steel ring surrounded by a flat rim of glass, and the position of the star is deduced from the time when it crosses the ring and its path while within it. The Abbé Rochon substituted for the wire micrometer one made of two prisms of rock-crystal or Iceland spar, capable of double refraction.

**MICROPHONE.** This instrument, invented in 1878 by Professor Hughes, does for faint sounds what the microscope (q. v.) does for matter too small for sight; the fall of a bit of tissue-paper or the tread of a fly being rendered audible at many miles distance. In principle the microphone illustrates the action of sonorous vibrations on the strength of an electric current. One of the most sensitive substances for microphonic action is willow-charcoal, plunged in a state of white heat into mercury. The theory is that in a homogeneous conductor the compressions and dilations of the molecules balance each other, and no variation of current ensues, while under minute subdivision, with electrical continuity, sonorous waves affect the strength of an electric current, and variations in the current reproduce sonorous waves. One form of microphone consists of a piece of mercury-tempered carbon, an inch long, placed vertically between two carbon-blocks hollowed to receive its ends, wires connecting the blocks with the battery and the receiver by which the sounds are to be heard. "A piece of willow-charcoal," says the inventor, "the size of a pin's-head is sufficient to reproduce articulate speech." Two nails laid parallel, with wire connections, and a third nail laid across them, make a simple form of microphone. A few cells of any form of battery may be used. A continuous sound has been made by the mutual interaction of the microphone and Telephone (q. v.), each instrument in turn repeating the sound made by the other. Many useful applications of the microphone have been made or suggested.

**MICROSCOPE** (Gr. *mikros*, small, and *skopeo*, I see) is an instrument for enabling us to examine objects which are so small as to be almost or quite undiscernible by the unaided eye. Its early history is obscure; but as it is quite evident the property of magnifying possessed by the lens must have been noticed as soon as it was made, we are quite safe in attributing its existence in its simplest form to a period considerably anterior to the time of Christ. It is generally believed that the first compound microscope was made by Zacharias Jansen, a Dutchman, in the year 1590, and was exhibited to James I. in London by his astronomer, Cornelius Drebbel, in 1619. It was then a very imperfect instrument, coloring and distorting all objects. For many years, it was more a toy than a useful instrument, and it was not until the invention of the acromatic lens by Hall and Dollond, and its application to the microscope by Lister and others, that it reached the advanced position it now occupies among scientific instruments.

An object to be magnified requires simply that it be brought nearer to the eye than when first examined, but as the focal distance of the eye ranges from 6 inches to 14 inches—10 inches being the average focal distance—it follows that a limit to the magnifying power of the eye is attained whenever the object to be examined is brought so near. If, however, we blacken a card, and pierce a hole in it with a fine needle, and then imagine a minute object, as, for instance, the wing of an insect held about an inch from the card, we shall see it distinctly, and that too magnified about ten times its size. This is explained by the fact, that the pin-hole limits the divergence of the pencil of rays, so that the eye can converge it sufficiently on the retina to produce a distinct impression, which is faint; and did not the blackened card exclude all other light, it would be lost. If we now remove the blackened card without either removing our eye or the object under examination, it will be found that the insect's wing is almost invisible, the unaided eye being able to see clearly an object so near as one inch; thus demonstrating the blackened card with the needle-hole in it to be as decided a magnifying instrument as any set of lenses.

By the apparent size of an object is understood the angle formed by two lines drawn from the centre of the eye to the extremities of the object, which is larger when the object is nearer the eye than when further removed. This angle is called the angle of vision, and is quite distinct from the angle of the pencil of light, by which the object is seen. The focal length of a lens determines its magnifying power. The object to be examined is placed in its focus, so that the light which diverges from each point may, after refraction by the lens, proceed to the eye in lines as nearly parallel as is necessary for distinct vision. In the fig. 1, AB is a doublet

convex lens, in the focus of which we have drawn an arrow, EF, to represent the object under inspection. The cones drawn from its extremities are portions of the rays of light diverging from these points, and falling on the lens. These rays, if not interrupted in their course by the lens AB, would be too divergent to permit their being brought to a focus upon the retina by the lenses which constitute the eye. But as they are first passed through the lens AB, they are bent into nearly parallel lines, or into lines diverging from some points within the limits of distinct vision, as from CD. Thus bent, these rays are received by the eye as if proceeding from the larger arrow CD, which we may suppose to be ten inches from the eye, and then the ratio of the length of the virtual image to that of the real arrow (nearly 10 to 1) gives the magnifying power of the lens in question. The ratio of CD to EF is the same as that of HG to KG. Now, HG is the distance of distinct vision, and KG the focal length of the lens, so that the magnifying power of a lens is obtained by dividing the distance of distinct vision (ten inches for most individuals) by its focal

length. Thus, if the focal length of a lens be  $\frac{1}{4}$  inch, the magnifying power is —  

$$= 40.$$
 This supposes that the distance between the eye and the lens is so small as not materially to interfere with the correctness of this statement.

We have supposed the whole of the light to enter the eye through the lens AB (fig. 1), but we must now state that so large a pencil of light passing through a single lens would be so distorted by its spherical figure, and by the chromatic dispersion of the glass, as to produce a very indistinct and imperfect image. This is so far rectified by applying a stop to the lens, so as to allow only the central portion of the pencil to pass. But while such a limited pencil would represent correctly the form and color of the object, so small a pencil of light is unable to bear diffusion over the magnified picture, and is therefore incapable of displaying those organic markings on animals or plants which are often of so much importance in distinguishing one class of objects from another. Dr Wollaston was the first to overcome this difficulty, which he achieved by constructing a doublet, which consists of two plano-convex lenses, having the focal lengths in the proportion of 1 to 3, and placed at a distance best ascertained by experiment. Their plane sides are placed towards the object, and the lens of shortest focal length next the object. By this arrangement, the distortion caused by the first lens is corrected by the second, and a well-defined and illuminated image is seen. Dr Wollaston's

doublet was further improved by Mr Holland, who substituted two lenses for the first in Dr Wollaston's doublet, and retained the stop between them and the third. This combination, though generally called a triplet, is virtually a doublet, inasmuch as the two lenses only accomplish what the anterior lens did in Dr Wollaston's

doublet, although with less precision. In this combination of lenses, the errors are still further reduced by the close approximation of the lenses to the object, which causes the refractions to take place near the axis, and thus we have a still larger pencil of light transmitted, and have also a more distinct and vivid image presented to the eye.

**Simple Microscope.**—By this term we mean an instrument by means of which we view the object through the lens directly. These instruments may be divided into two classes—those simply used in the hand, and those provided with a stand or frame, so arranged as to be capable of being adjusted by means of a screw to its exact focal distance, and of being moved over different parts of the object. The single lenses used may be either a double convex or a plano-convex. When a higher power is wanted, a doublet, such as we have already described, may be employed, or a Coddington lens, which consists of a sphere in which a groove is cut and filled up with opaque matter. This is perhaps the most convenient hand lens, as it matters little, from its spherical form, in what position it is held. In the simple microscope, single or combined lenses may be employed, varying from a quarter to two inches. There are many different kinds of stands for simple microscopes made, but as they are principally used for dissection, the most important point next to good glasses is to secure a firm large stage for supporting the objects under examination. When low powers alone are used, the stage movements may be dispensed with; but when the doublet or triplet is employed, some more delicate adjustment than that of the hand is necessary.

**Compound Microscope.**—In the compound microscope the observer does not view the object directly, but an inverted image or picture of the object is formed by one lens or set of lenses, and that image is seen through another lens. The compound microscope consists of two lenses, an object and an eye lens; but each of these may be compounded of several lenses playing the part of one, as in the simple microscope. The eye-lens is that placed next the eye, and the object-lens that next the object. The former is also called the ocular, and the latter the objective. The object-glass is generally made of two or three achromatic lenses, while the eye-piece generally consists of two plano-convex lenses, with their flat faces next the eye, and separated at half the sums of their focal lengths, with a diaphragm or stop between them. Lenses of high power are so small as to admit only a very small beam of light, and consequently what is gained in magnifying power is often worthless from deficient illumination. Various devices have been employed to overcome this difficulty. The light may be concentrated by achromatic condensers placed beneath the stage, or the curvature of the lens may be such as to allow as large a number of divergent rays as possible to impinge upon it. Such a lens is said to have a large "angle of aperture," the angle of aperture being that made by two lines converging from the margins of the lens to its focal point. Recently lenses, termed "immersion lenses," have been constructed, of such a curvature that when immersed in a drop of water placed over the object, light is admitted on all sides. With an immersion lens there is high magnifying power with sufficient illumination.

The following diagram explains the manner in which the compound microscope acts. We have here represented the triple achromatic objective, consisting of three achromatic lenses combined in one tube, in connection with the eye-piece, which consists of the field-glass FF, and the eye-glass EE. Three rays of

ing of three achromatic lenses combined in one tube, in connection with the eye-piece, which consists of the field-glass FF, and the eye-glass EE. Three rays of

light are represented as proceeding from the centre, and three from each end of the object. These rays would, if not interfered with, form an image at AA; but coming in contact with the field-glass FF, they are bent, and made to converge at BB, where the image is formed, at which place a stop or diaphragm is placed to intercept all light, except what is required to form a distinct image. From BB, the rays proceed to the eye-glass exactly as they do in the simple microscope, and as we have explained in fig. 1. The image therefore formed at BB is viewed as an original object by an observer through the eye-piece EE. The lens FF is not essential to a compound microscope; but as it is quite evident that the rays proceeding to AA would fall without the eye-lens EE, if it was removed, and only a part of the object would thus be brought under view, it is always made use of in the compound microscope.

A mirror is placed under the stage for reflecting the light through the object under observation. This method of illumination by transmitted light is used when the object is transparent. When opaque, light is reflected on the object by a bull's-eye lens, called a condenser. The best instruments are supplied with six or seven object-glasses, varying in magnifying power from 20 to 2500 diameters. The eye-pieces supplied are three in number, each of which consists of two plano-convex lenses, between which a stop or diaphragm is placed, half-way between the two lenses. As the magnifying power of a compound microscope depends on the product of the magnifying powers of the object-glass and the eye-piece, it follows that its power may be increased or diminished by a change in either or both of these glasses. In the mechanical arrangements, it is of importance to have the instrument so constructed, that while every facility is afforded for making observations and easy means of adjustment, there should also be great steadiness, without which, indeed, no satisfactory results will be obtained. These ends are achieved in various ways, of which one of the simplest is a brass stand, supported on three feet; mirror supported on trunnions; diaphragm, pierced with circular holes of various sizes, to regulate the admission to the object of reflected light from the mirror; stage-plate, on which the object is placed; screw, with milled head for fine adjustment; the object glass or objective; brass tube in which the body of the instrument is moved, so as to effect the coarse adjustment; the eye-piece, or ocular.

The microscope has now become so important an instrument in education, that almost every department of science in which it can be employed has a microscope suited to its particular kind of work, and a special treatise explaining and illustrating its use; and many branches of science have instruments peculiarly their own. Thus, chemists, anatomists, zoologists, &c., have each an instrument which they value as being peculiarly adapted for their special fields of inquiry and observation. From this instrument the chemist, and natural philosophers generally, have derived great assistance in studying the different kinds of crystals; for by means of it, they can not only observe and recognise the great variety of forms that exist, but at any moment, and with little trouble, they may witness the process of crystallisation, and leisurely study it. Those sciences in which it is most used, and for which it has done most, are anatomy, physiology, botany, zoology, medicine, mineralogy, and geology. In the practice of medicine all medical men who aim at a scientific treatment of disease have fully recognised how useful it has been as an agent in diagnosis, more especially in diseases of the kidneys. In the detection of crime and the vindication of innocence it is no less useful, as by means of it we can with certainty determine whether a suspicious stain, found for instance on the clothing of an individual charged with murder, has been caused by blood or by another coloring matter. In like manner, we can determine whether hair found in similar circumstances belongs to a human being or not. It has also enabled us to distinguish the difference existing between substances that have a similar chemical reaction (e. g., the various kinds of starch, as flour, potato, sago, &c.), and thus we are provided with an agent quick in detecting adulteration.

A few hints to amateur observers may not be out of place here. In choosing an instrument, the simpler it is the better. The essential point to attend to is, to have good glasses, which are tested by their power of showing some very minute markings, such as we find on diatoms. The circumference of the field of view should not be tinged with color, and the definition should be as good at the edge as at the centre. The beginner should use low powers in preference to high ones. The best

light is that reflected from a white cloud during the day. Artificial light should, if possible, be avoided. The table must be steady on which the microscope is placed, and when not in use, the instrument should be covered by means of a glass shade. The observer also requires a few oblong glass slides, and a few circles of thin glass, called covering-glasses, to lay over the preparation under examination. For making sections, dissecting, and the various manipulatory operations attending the use of the microscope, he requires, moreover, a pair of forceps, a knife, or, perhaps better, a razor ground flat on the one side, a few needles fixed in handles, and two or three hair-pencils. So equipped, the observer is able to begin examinations of texture at once with pleasure and advantage. Begin with simple objects, such as pollen and thin slices of the cuticle of flowers, mosses, and different kinds of starch, such as *tous le mois*, buck, yam, cycas, arrow-root, &c., and notice particularly their different characters. Make as thin a section as possible, place it on the centre of the slide, and allow a drop of water to fall on it from the end of the handle of the needle. Then allow the covering-glass to fall gently on it—obliquely, so as to press out any small bubbles of air. He should also have a few bottles containing "reagents," such as dilute acetic acid (equal parts of pyroligneous acid and water) and liquor potassæ. By means of these reagents, peculiarities of structure may often be observed.

Microscopes vary much in price, from 5s. to upwards of £100. A good serviceable dissecting simple microscope may be had from any philosophical-instrument maker for from 9s. to 15s. Compound microscopes are more expensive, but a wonderfully good instrument for beginners can be had at 30s. It has one eye-glass and three object-glasses, and magnifies from 70 to 200 diameters. If a superior instrument is wished—one suited for most purposes of observation and research—one of the following will be found well worth the price:—The microscope of Hartnack, with a joint, so that it may be inclined at any angle, has two-eye pieces, two object-glasses, magnifies from 50 to 450 diameters, and costs about £7; Næcher's microscope has three eye-pieces, three object-glasses, magnifies from 50 to 750 diameters, and costs £10; Smith and Beck's educational microscope has two eye-pieces, two object-glasses, magnifies from 50 to 350 diameters, and costs £10; Ross supplies microscopes from £5 to £100, with various number of glasses.

For a more complete account of the different kinds of microscopes, and the various purposes to which they are applied, see Quekett "On the Microscope" (1865); Carpenter "On the Microscope" (1862); Hogg "On the Microscope" (1865); and "How to work with the Microscope" (1864), by Beale.

**MICROZAMIA**, a genus of plants of the natural order *Cycadaceæ*. They are widely diffused over Australia. The fronds resemble those of palms, and are used in the Roman Catholic Church on Palm Sunday. The underground stem is large and turnip-like, but covered with scale or leaf-scars, and contains a substance resembling tragacanth. The nuts of *M. spiralis* are edible, but are only used in times of scarcity.

**MIDAS**, a common name of the more ancient Phrygian kings, of whom Midas, the son of Gordius and Cybele, is the most famous. He was a pupil of Orpheus. Among the many legends regarding him is one, that Bacchus granted his wish, that whatever he touched might become gold; from which so great inconvenience ensued, that he was glad to get himself relieved from the burden by washing, at the command of the god, in the Pactolus, the sands of which became thenceforth productive of gold. Another legend represents him as having offended Apollo by assigning the prize in a musical competition to Pan, and as having therefore been endowed by him with a pair of ass's ears, which he concealed under his Phrygian cap, but which were discovered by his servant.

**MIDDELBURG**, a town of the Netherlands, capital of the province of Zeeland, in the island of Walcheren. It is connected with the sea by a canal, five miles long, which admits ships of heavy burden, and is a station of the railway from Flushing to Roosendaal to join the Dutch and Belgian lines. Pop. (1st Jan. 1875) 15,928. The city is nearly circular, and a league in circumference, surrounded by a broad canal. In former times, M. was one of the leading mercantile cities of the United Provinces, sending many ships to the East and West Indies, America, and all European ports, founding the colonies of Surinam, Berbice, Essequibo, Demerara, &c.; but the

Middle  
Middlesbrough

60

opening of the Scheldt for Antwerp, and other causes, have reduced the foreign trade to single ships to Java. Many of the inhabitants are wealthy, which, with its being the meeting-place of the provincial states of Zeeland, and possessing a considerable trade in grain, salt, &c.—making beer, vinegar, starch, leather, having snuff, chocolate, oil and saw mills, and foundries—make it still a city of importance. It is the finest city of the northern provinces, having handsome houses, ornamented with gardens, and the canals and streets shaded with trees. The Town-house, founded in 1468, has a beautiful tower, and is decorated with 25 colossal statues of Counts and Countesses of Holland. At the beginning of the 12th c., an abbey was founded, which was, later, enriched by Willem I., Count of Holland and Zeeland. The buildings are now occupied as the meeting-place of the provincial states.

M. does not date further back than the 9th century. In 1574, the Spaniards, under Mondragon, were compelled by famine to give up M., after having defended it for 22 months against Prince Willem I. Though troops are stationed in M., it is no longer tenable against an enemy.

**MIDDLE AGES**, the designation applied to the great historic period between the times of classic antiquity and modern times. The beginning and close of this period are not very definite. It is usual, however, to regard the middle ages as beginning with the overthrow of the Western Roman Empire in the year 476; and there is a pretty general concurrence in fixing on the Reformation as the great event which brought this period to a close. It began with the rise of the Frankish upon the ruins of the ancient Roman Empire, and with the commencement of civilisation among the barbarous tribes which had taken possession of the former Roman provinces. In course of it, the different nations of modern Europe were formed, and their political and social systems developed. It was a period of much superstition, in connection with which much religious enthusiasm very extensively prevailed, manifested in many great religious endowments, in magnificent ecclesiastical buildings, in pilgrimages, and, above all, in the Crusades. In the earlier parts of this period, the Church was much occupied in the extension of its bounds in the north of Europe, where heathenism still subsisted, and the means employed were not always consistent with the spirit of Christianity. During the middle ages, the hierarchy acquired enormous power and wealth, and the papacy rose from comparatively small beginnings to its utmost greatness. During the middle ages, chivalry had its rise and decline, modifying, and in many respects tending to refine the feelings and usages of society. Towards the close of the middle ages, the revival of letters, the increase of knowledge, and the formation of a wealthy and influential class in society, distinct alike from the aristocracy and the peasantry, tended, even before the Reformation, both to the diminution of the power of the hierarchy and the decay of the feudal system. See Guizot's "Histoire de la Civilisation;" Rühn's "Handbuch der Geschichte des Mittelalters;" and Hallam's "History of the Middle Ages."

**MIDDLE LATITUDE SAILING.** See **SAILING.**

**MIDDLE LEVEL.** Under the heading **BEDFORD LEVEL**, a remarkable district, covering 400,000 acres, is described, bounding the Wash on all sides except seaward, extending landward nearly to Brandon, Cambridge, Peterborough, and Bolingbroke, and embracing portions of the six counties of Northampton, Huntingdon, Cambridge, Lincoln, Norfolk, and Suffolk. It nearly coincides in area with what is popularly known as the Fens. The whole region was, centuries ago, converted into an unprofitable marsh by repeated incursions of the sea, coupled with obstructions to the outward flow of the rivers Nene, Cam, Ouse, Welland, &c. Vast operations have been carried on ever since the time of Charles I., by digging new channels and outfalls, and employing windmills and steam-engines to pump the water from the marshes and ponds into these artificial channels. The Bedford Level is divided into the *North*, the *Middle*, and the *South Levels*, managed by commissioners, whose powers are derived from special acts of parliament. The improved value of the land is the fund out of which the expense of the engineering works is defrayed. It was in one of these districts (the Middle Level, between the Nene and the Old Bedford River) that an irruption took place in 1862, which strikingly illustrates the dependence of the safety of the whole region on well-formed and well-maintained embankments. There was a sluice, called St Germain's Sluice, situated at the con-

fluence of the Middle Level main outfall drain with the river Ouse, near the upper end of another artificial channel, known as the Ean Brink Cut. The drain was made in 1847, and was enlarged ten years afterwards to a bottom-width of 48 feet, a side-slope of 2 to 1, and a level of 7 feet below low-water spring-tide in the river; the rise of high-water spring-tide at that point was 19 feet, and the sill of the sluice was 6 feet below low-water spring-tide.

On the 4th of May 1862, this sluice gave way without the slightest warning; the tidal waters undermined the brick work, and formed a hole in the bed of the river, into which the works of the sluice sank. The tidal waters rushed up the opening, and ebbed and flowed throughout a distance of 20 miles. The commissioners of the Middle Level applied to Mr Hawkshaw, the engineer, to devise means for repairing the disaster. An earth and cradle-dam was attempted to be thrown across the drain, at about 500 yards from the fallen sluice; but this was relinquished in favor of a permanent coffer-dam of pile-work, at a distance of half a mile from the sluice; and after incessant exertions from May 16 to June 19, the tidal waters were at length effectually shut out by a strong dam. The failure of the St Germain's Sluice was not the only irruption that had to be battled with; eight days after that failure, under the pressure of a high spring-tide, the west bank of the drain gave way, on May 12, at a point about 4 miles from the sluice; the bank had been built only to resist upland waters, and not a rush and a pressure of the sea. The rupture carried away 70 yards of the bank, scouring out a hole 10 feet deep at the spot, and admitting a rush of water which covered 6000 acres of fertile land to a depth of 2 or 3 feet, increased at successive high-tides to 10,000 acres.

When the finishing of the dam had enabled Mr Hawkshaw to shut out the tidal waters, means had to be devised for getting rid of the flooding waters, and providing an outlet for the usual rivers and land-drainage of the Middle Level. It was resolved to utilise some of the old outlets at other spots, and to supplement their action by enormous syphons, placed over the coffer-dam. Sixteen syphons were provided. They were made of cast iron, 3 feet 6 inches internal diameter, and somewhat over 1 inch thick; they rested on the top of the dam, and on inclined framework supported by piles at the sides. The valves were so arranged, that the syphons could be put in operation, either by exhausting the air or by filling them with water. When only six of the syphons were in position, they carried 50,000 gallons of water per minute over the dam.—For more minute details of the dam and the syphons, see Mr Hawkshaw's paper read before the Institute of Civil Engineers in 1863.

There are large items both of cost and of compensation in works of this kind. Nearly the whole of the Middle Level is 15 feet below high-water spring-tides; it is difficult to keep out the sea-water, and at the same time to preserve an outlet for the land-water, especially Whittlesea Mere; there are 130,000 acres to be drained somehow or other; but as the land is rich for farming, the commissioners, in past years, did not hesitate to spend £200,000 on 11 miles of drain, and £30,000 on the sluice. The drain runs through a district called *Marshland*, between Lynn and Wisbeach; and as the bursting of the bank caused this district to be deluged with water, the commissioners have had to compensate the Marshland farmers and others; the amount of this compensation was frequently litigated between 1862 and 1867. As concerns the land itself, it is found to be more fertile after such inundations than before, owing to the amount of silt deposited on the fields. After repairing the breach in the bank, the 10,000 inundated acres were drained without much difficulty, through the Marshland, Smeeth, and Fen drain, and the Marshland sewer; the syphons are permanent channels, to carry off the usual land-waters regularly. The syphons were subjected to a severe trial in January 1867, by the ice which accumulated around their lower ends; but iron gratings effectually resisted the entrance of the ice into the syphons.

**MIDDLE TEMPLE**, one of the four English Inns of Court, having the exclusive privilege of calling persons to the bar. See **INNS OF COURT**.

**MIDDLESBROUGH**, the centre of the north of England iron manufacture, is an important market-town, port, and parliamentary borough in the North Riding of Yorkshire, at the mouth of the Tees, 48 miles n. e. from York, returning one member to parliament. The town is of recent growth, and owes its origin as a port to its convenient position for the shipment of coals brought down by railway from the mines in South Durham. In 1842, a commodious dock was constructed,

which has recently been very considerably enlarged, and will admit ships of the largest tonnage.

On the discovery, in 1840, of immense beds of ironstone, extending throughout the whole range of the Cleveland Hills, a portion of which lies close to the town, the smelting of iron was speedily embarked in on an extensive scale, which has since increased to a marvellous extent, to which has been added iron-foundries, the manufacture of rails, locomotive engines, tubes, boilers, &c., chemical works, potteries, and ship-building are also carried on to a large extent. The town of M. was incorporated in 1853, and constituted a parliamentary borough in 1869, is well built, and some of the streets present handsome specimens of architecture. The Royal Exchange, built in 1867, is a large and handsome building; within its spacious interior, the weekly iron market is held on Tuesdays, and is attended by parties connected with the iron trade from all parts of the kingdom, as well as foreigners. There are five churches of the national establishment, and numerous places of worship connected with the various religious denominations. Albert Park, containing 72 acres, is tastefully laid out.

At the census taken in 1831, M. was an obscure hamlet with 383 inhabitants; in 1871, the parliamentary borough contained a pop. of 46,643, and in 1874 it was estimated at upwards of 60,000.

**MIDDLESEX**, the metropolitan county of England, in the south-east of the country, bounded on the north by Hertford, and on the south by Surrey, and about 60 miles inland (westward) from the North Sea, with which it communicates by the river Thames. Next to Rutland, it is the smallest of the English counties, its area being only 180,186 statute acres; but its population is inferior only to that of Lancashire, and was, in 1871, 2,539,756. The surface is on the whole level, with gentle undulations. The Thames, which forms its southern boundary, and its affluents, are the only rivers of the county. Two of these, the Colne and the Lea, form respectively the western and the eastern boundaries of the county. The surface is also traversed by the Grand Junction and Regent's Canal, and the New River, an artificial cut intended to supply the capital with water. The soil is in general poor, with the exception of a tract along the banks of the Thames, which consists of a good fertile loam. The county is chiefly occupied in grass and hay farms, and in market-gardens, the produce of which is sent to supply the metropolis. Parliamentary elections of members for Middlesex are held at Brentford, which is the county town. There are no other towns of importance except London.

**MIDDLETON**, a small manufacturing town of Lancashire, six miles north-east of Manchester. Pop. (1861) 9976; (1871) 14,587. It is chiefly dependent upon its manufactures of cotton cloth and silks.

**MIDDLETON**, a small decaying market-town of Ireland, in the county of Cork, and 18 miles by railway east of the city of that name. It contains a college founded in 1696, noticeable as the place in which John Philipot Curran was educated, and still of considerable reputation, and carries on a general trade. Pop. (1871) 3008.

**MIDDLETON**, Conyers, D.D., a well-known divine and scholar of the Church of England, was born in 1633, at Richmond, in Yorkshire. He studied at Cambridge, where he took the degree of B.A. in 1702, was elected a fellow in 1706, and shortly after married a lady of fortune. His life was a series of bitter, and, on the whole, not very creditable controversies, though he is said to have been rather a likeable person in private. His first and most formidable opponent was Richard Bentley (q. v.); afterwards, his polemics were chiefly of a theological character. The views he expressed and defended were generally such as to draw down upon him the imputation of being an "infidel in disguise," though some of them—such as that the Jews borrowed some of their customs from Egypt, and that the primitive writers in vindicating Scripture found it necessary sometimes to recur to allegory—are now established beyond all doubt; while a third opinion, viz., that the Scriptures are not of absolute and universal inspiration, has since M.'s day been adopted by many of the most learned and accomplished divines even of his own church. M. died at Hildersham, in Cambridgeshire, July 25, 1750. His principal writings are "The History of the Life of M. Tullius Cicero" (2 vols. 1741), a work both interesting and valuable, but neither very impartial nor quite accurate. His celebrated "Letter from Rome, shewing an exact Conformity between Popery and

Paganism; or the Religion of the present Romans derived from that of their Heathen Ancestors" (1759), provoked the most violent indignation among Roman Catholics, and is still read with interest. All his pamphlets, treatises, &c., were collected and published under the title of "Miscellaneous Works" (4 vols. Lond. 1752—1757), and contain much that is curious and valuable on theological and antiquarian topics.

**MIDDLETOWN**, a city and township in Connecticut, United States of America, at the head of navigation, on the right bank of the Connecticut River, 23 miles from its mouth. It is a well-built town, with a handsome custom-house, Wesleyan university, episcopal seminary, 16 churches, 4 banks, 8 cotton factories, foundries, mills, &c. Pop. of city in 1870, 6928; (1880) 6,826.

**MIDDLEWICH**, a small market-town of England, Cheshire, on the Grand Trunk Canal, 20 miles east of Chester. Salt is extensively made; boat-building is carried on, and brick-works are in operation. Pop. (1871) 3085.

**MIDGE**, the common name of many species of small dipterous insects, of the family *Tipulidæ*, much resembling gnats, but having a shorter proboscis. Their larvæ are aquatic; the perfect insects are often very annoying both to human beings and to cattle. The little pink-colored tortuous worm known to anglers as the *Blood-worm*, frequent in water-barrels and in the mud near the edges of ponds and ditches, is the larva of a species of *M.* (*Chironomus plumosus*), a little larger than the common gnat, very abundant in Britain, particularly in marshy situations. The larva is much sought after both by birds and fishes, and is a very tempting bait for the latter. The pupa is cylindrical, with respiratory organs on the sides of the thorax. When the insect is ready to quit its pupa case, it rises to the surface of the water, and there remains suspended for a short time; the perfect insect, when it has issued from the case, also stands for a short time on the surface of the water. The genus is remarkable for the long hairs with which the antennæ of the male are furnished.—Another genus of Midges (*Simulia*) contains many species which are most tormenting to men and cattle, by entering the ears and nostrils, and alighting on the eyelids. Several species are British. They swarm on marshes and damp heaths in the warmer months. But none of them is nearly so mischievous as a species (*S. columbaschensis*) found on the banks of the Danube, and so plentiful, that horses and cattle are often suffocated by the numbers which get into the wind-pipe.

**MIDHURST**, a market-town and parliamentary borough of England, in Sussex, on the Rother, a navigable tributary of the Arun, 60 miles south-west of London. Here are the ruins of an old castle of the Bohuns, lords of *M.*; and within half a mile east of the town stood Cowdry House, the seat of the Montagues, which, with the exception of the gate-house, was burned down in 1798. *M.* returns one member to parliament. Pop. (1861) of parliamentary borough, 6406; (1872) 6768.

**MIDIANITES**, an Arab race, descended, according to Scripture, from Midian, the son of Abraham by Keturah. They occupied the greater part of the country between the north side of the Arabian Gulf and Arabia Felix as far as the Plains of Moab. Others more civilised (if not, indeed, of Cushite origin) dwelt in the vicinity of the Sinaitic peninsula, and carried on a trade, particularly with Egypt. To the latter, we may presume, belonged Jethro, priest or "sheik" of Midian—the father-in-law of Moses. The *M.* were very troublesome neighbors to the Israelites till Gideon's victory over them. Their national god was Baal-Peor.

**MIDRASH** (Heb. *darash*, to search, explain the Scriptures) is the general name given to the exposition of the Old Testament, which, for about 1500 years, formed the centre of all mental activity, both in and out of the schools, among the Jews after the Babylonish exile. The prohibitions and ordinances contained in the Mosaic records, to which a precise meaning was, not in all cases, attached, were, according to certain hermeneutical rules, specified and particularised, and further surrounded by traditional ordinances and inhibitions: Halacha (q. v.) = rule by which to go, or the binding, authoritative, civil, and religious law. The chief codes of this are the Mishna (q. v.), Gemara (q. v.), Sifra (an amplification on Leviticus), Sifri (on Numbers and Deuteronomy), and Mechilta (on a portion of Exodus). Another branch of the Midrash, however, is the Haggada (q. v.), a kind of free poetical homilectics on the whole body of the Old Testament (the Halacha being chiefly

## Midshipman Midwife

64

confined to the Pentateuch). The chief collections of that part of the Midrash are *Midrash Rabba*, 700—1100 A.D. (on Pentateuch and Megilloth), and *Pesikta* (700), the extracts from which (Jalkut, *Pesikta Rabbati*, *Sutarta*, &c.) only are known, the original itself never having been printed.

**MIDSHIPMAN**, the second rank attained by combatant officers in the royal navy. After two years' service as naval cadet, the aspirant becomes a midshipman, which is rather an apprenticeship for his after-naval career than any really effective appointment. The midshipman's time is principally devoted to receiving instruction, both in the ordinary subjects of a gentleman's education, and in the special professional duties of a naval officer. After 1½ year's service as such, the midshipman is required to pass a qualifying examination in geography, history, and general knowledge; and, two years later, he must pass in French conversation, and in seamanship, steam, and gunnery. He then becomes a Sub-lieutenant (q. v.); and if 19 years of age, is eligible for promotion to lieutenant, whenever opportunity offers.

A midshipman only receives 1s. 9d. a day (£31, 18s. 9d. per annum); he is consequently dependent on his friends for more or less pecuniary assistance until he becomes a sub-lieutenant.

**MIDSUMMER DAY**, one of the four English quarter-days for payment of rent by tenants, viz., 24th June. See **LANDLORD AND TENANT**.

**MIDSUMMER EVE**. See **JOHN'S (ST) EVE**.

**MIDWIFE, MIDWIFERY**. Midwife (Anglo-Saxon, *med-wif*, meaning probably a woman hired for *medic*, or reward) is the name applied to a woman who assists in parturition or delivery. From this is derived the term *Midwifery*, for that department of medical science which concerns itself with delivery, and its allied subjects. Writers who prefer words derived from Latin and Greek roots to such plain old English words as midwifery, have substituted for it *Obstetrics* (Lat. *obstetriz*, a woman who stands near, a midwife), and *Tokology* (Gr. *tokos*, child-birth), or *Gynaecology* (Gr. *gynē*, woman); for a male practitioner in this line of the medical art, the French name *accoucheur* is used; and recently, an obnoxious new verb, to *accouch* (Fr. *accoucher*, to deliver a woman), has made its appearance in medical literature.

Midwifery, as a branch of medical science, is understood to include the study of the anatomy of the parts of the female body concerned; the doctrine of conception and of sterility, and the signs and duration of pregnancy; parturition in all its varieties; and the diseases peculiar to the puerperal state. To enter into details of such matters, would be out of place in this work. With regard to parturition itself, it may be interesting to remark, that in a vast majority of cases the labor is what is called "natural," that is, the child presents itself in the normal position, and unaided nature completes the delivery within twenty-four hours with safety to the mother and child. Dr Smellie calculated that 990 in 1000 are "natural" labors; and the later statistics of Dr Collins, based on 15,850 cases, give a similar result—viz., 963 in 1000.

"Unnatural" labor arises either from malformation, disease, or weakness on the part of the mother, or from abnormal conditions of the child; and manual or instrumental aid becomes necessary to prevent the labor from being dangerously prolonged, or—in the more extreme cases—to render delivery at all possible. Of instrumental applications, by far the most important and frequent is that of the Forceps (q. v.), which is not intended to injure either mother or child. In 123,295 cases of labor attended by British practitioners, there were 342 forceps cases, or 1 in 360; of these, about 1 in 21 proved fatal to the mother, while 1 child in 4 was lost. In Craniotomy, the head of the child is intentionally destroyed, with a view to save the life of the mother, the death of both being otherwise inevitable. Among British practitioners, this operation is not often resorted to; it proves fatal to about one mother in 5½. See also **CÆSAREAN OPERATION**.

**History**.—From all the passages in the Scriptures where midwifery is referred to, it is plain that women were the only practitioners of this art amongst the Hebrews and the Egyptians (see Gen. xxxv. 17, and xxxviii. 28, and Ex. i. 15—21), and it is equally certain that the Greeks and Romans confided this branch of medicine to women. Phænarete, the mother of Socrates, was a midwife; and Plato explains the

functions and mentions the duties undertaken by these women. The Greek and Roman physicians were not ignorant of midwifery, for Hippocrates refers to the necessity of turning the child in certain cases, although his doctrines on this point, as also on the management of the placenta, are replete with danger; and Celsus, nearly four centuries later, treats of the mechanism of labor with great clearness. A gradual increase in the knowledge of this subject may be traced in the writings of Aëtius and Paulus Ægineta, who advocates the operation of craniotomy in certain cases. Rhazes seems to have been the first to advocate the rupture of the membrane, when, by their toughness, they impede labor; and Avicenna gave the first description of an instrument partially resembling the more modern forceps.

At the commencement of the 16th c., Eucharius Rhodion published a little book, which soon acquired a great celebrity. It was translated from the original High-German into Latin, French, and English, and is remarkable as being the first book published on this subject in England. Its title is, "The Byrth of Mankynde, otherwise named the Woman's Book," by Thomas Raynold, Physician (London, 1540), and it contains no external evidence that it is a mere translation. In 1573, Ambrose Paré published a small work, in which he shewed that foot-presentations were not dangerous, and that in mal-presentations it was better to deliver by the feet than to attempt to bring down the head.

In the early part of the 17th c., the *sage-femme* (the French term corresponding to our English midwife) of Marie de Medicis published a collection of observations on midwifery. About this time (probably about 1640), Dr Paul Chamberlen, an English physician, invented\* the forceps with separate blades, such as are now used. The Chamberlen family (the father and three sons) did not, however, publish their discovery; considering that they had a right to use the secret in the way most to their own advantage; and the exact nature of their instruments was not known till 1815, when the tenant of a house near Maldon, in Essex, where Dr Peter Chamberlen, one of the sons, had resided more than a century previously, accidentally discovered a concealed space, in which were, *inter alia*, a collection of obstetric instruments, including a double-bladed forceps and a vectis, which are now in the possession of the London Medico-Chirurgical Society. Although Chamberlen's celebrated *arcanum* was doubtless the double-bladed forceps, he seems, therefore, also to have been the discoverer of the vectis or lever. In 1668, Mauriceau's *Traité* appeared, which ran through seven editions, and was for a long time the standard work on the subject. He gives a very full account of the process of labor; and his book having been translated into English, in 1672, by Hugh Chamberlen, became widely known in this country. This seems to have been the time when men began to engage generally in the practice of midwifery; Harvey, the Chamberlens, and others, taking it up in England; while La Vallière, the mistress of Louis XIV., did much to establish the practice in France, by employing Julian Clement, a surgeon of high reputation, in her first confinement in 1663.

The last point requiring notice in the history of midwifery in the 17th c., is the discovery of the use of ergot of rye in accelerating parturition. In 1688, Camerarius stated that midwives in some parts of Germany were in the habit of employing it for this purpose; but it is not till 1774 that we find any further reference to the use of this drug.

In the early part of the 18th c., different varieties of forceps, closely resembling Chamberlen's instrument, were invented by Giffard, Chapman, and others; Chapman being, as it is believed, the first public teacher of midwifery in London. About the middle of this century, lived Sir Richard Manningham, who devoted himself to this branch of the profession, and established a small hospital for the reception of parturient women, which was the first of the kind in the British dominions. It is scarcely necessary to enter into further historical details, as midwifery was by this time fully recognised as a branch—although then and long subsequently, considered as the lowest branch—of medicine. The names of Smellie, William Hunter, Denman, and Bland in England, and of Astruc and Baudelocque in France, are well-

\* The exact date of this important invention is not known, but in 1647, Dr Peter Chamberlen published a pamphlet entitled "A Voice in Rhama," in which he speaks of his father's (Dr Paul Chamberlen) discovery for the saving of infantile life. Hence the forceps must have been invented in the first half of the 17th century.

known as promoters of various departments of the art of midwifery towards the close of this century.

In the present century, the art of midwifery has steadily progressed. The by-laws precluding practitioners in midwifery from the Fellowship of the London College of Physicians, and other equally offensive rules in other institutions, have been repealed; there are professors of, or lecturers on midwifery in all our medical schools (excepting at the universities of Oxford and Cambridge); and a knowledge of this department of medicine is now required from every candidate for the medical profession. And not only are the members of the medical profession compelled to be as well versed in midwifery as in medicine or surgery, but the ignorant midwives of past times are now replaced by comparatively well-educated nurses, with diplomas, certifying that they have regularly attended lectures on midwifery, and have taken personal charge of a certain number of labors, under the superintendence of a qualified teacher. And that properly educated women are capable of undertaking all the responsibilities of this department of practice, is shown by such cases as those of Mesdames Boivin and Lachapelle, who (to use the words of Professor Velpeau), "although the pupils of Bandelocque, were not afraid to shake off, to a certain extent, the yoke of his scientific authority, and whose high position and dignity form the starting-point of a new era for the science of obstetrics in Paris."

**MIGNET**, François Auguste Alexis, a French historian, was born 8th May 1796, at Aix in Provence, studied law in his native city along with Thiers, and went to Paris in 1821, to devote himself to a literary life. He found employment in writing for the public journals, and having given lectures on Modern History, which were received with great approbation, he was induced to write his "*Histoire de la Révolution Française* (2 vols. Par. 1824; 10th edition, 1840), a work in which that great event is regarded less in its moral than its philosophical aspects. It has therefore been reproached with leading to fatalism. His style is brilliant, but academic. After the revolution of 1830, he became a Counsellor of State, and Keeper of the Archives of the Ministry of Foreign Affairs; but lost these offices in 1848, since which time he has lived in retirement. He has edited "*Négociations relatives à la Succession d'Espagne sous Louis XIV.*" (4 vols. Par. 1836—1843), to which he prefixed a masterly historic introduction. Among his later works are "*Histoire de Marie Stuart*" (2 vols. Par. 1851), and "*Charles Quint, son Abdication, son Séjour et sa Mort au Monastère de Yuste*" (1854); "*Eloges Historiques*" (1864); and "*Rivalité de François I. et de Charles V.*" For a "*Histoire de la Réforme, de la Ligue et du Règne de Henri IV.*," he is said to have collected hundreds of volumes of manuscript correspondence.

**MIGNONETTE** (*Roseda odorata*), a plant of the natural order *Rosaceæ*, a native of the north of Africa, in universal cultivation on account of the delicious fragrance of its flowers. It is, according to circumstances and the mode of cultivation, an annual or a perennial, and even half-shrubby plant, with lanceolate entire or trifid leaves, and erect terminal racemes of small whitish flowers, which have the calyx 6-parted, and as long as the corolla; the capsules 3-toothed. It is to be seen during summer in almost every garden, and during winter in almost every greenhouse in Britain; it is often cultivated in flower-pots in apartments, and no flower is so common in the boxes which are placed outside of windows in towns. Yet it was first introduced into England by Lord Bateman, who brought it from the Royal Garden at Paris in 1782; nor had it then been long known in France. It rapidly became a universal favorite throughout Europe. The French name *M.*, now its popular name everywhere, signifies *Little Darling*. What is called *Tree M.* is not even a distinct variety, but merely the common kind trained in an erect form, and prevented from early flowering by plucking off the ends of the shoots.—Weid (q. v.) belongs to the same genus.

**MIGRATIONS OF ANIMALS**, which must not be confounded with their diffusion over a more or less extended area, are apparently always guided by an instinct operating on all, or nearly all, the individuals of a species, and leading them to move in a definite direction in search of food or (in the case of fishes) of a fit position for spawning.

Among mammals, such migrations are comparatively rare. The most remarkable instance is that of the Lemmings, which at no definite epoch, but generally

once or twice in a quarter of a century, traverse Nordland and Finmark in vast hosts, ending their career in the Western Ocean, into which they enter, and come to a suicidal end; or, taking a direction through Swedish Lapland, are drowned in the Gulf of Bothnia. M. Martins, who was a member of the great scientific Scandinavian expedition, seems to doubt the generally entertained view of these animals casting themselves into the Western Ocean, and believes that most of them perish from the cold in crossing the rivers, while many are killed by dogs, foxes, and a species of Horned Owl (*Strix brachyotos*) which in large numbers always accompanies these emigrations.

According to Gmelin, the Arctic Fox (*Fulpes lagopus*) always accompanies the lemmings in such numbers that, on this ground, it is entitled to be considered a migratory animal; but independently of these special migrations, it is stated by Sir James Ross that "the young generally migrate to the southward late in the autumn, and collect in vast multitudes on the shores of Hudson's Bay; they return early the following spring to the northward, and seldom again leave the spot they select as a breeding-place."

The Spring-bok (*Antidorcas Kuchore*) is accustomed to make pilgrimages from one spot to another in the vast plains of Southern Africa. Herds of many thousands are led by their chiefs in these migrations, and the wonderful density of the moving mass may be imagined from the fact, that a flock of sheep has been inextricably tangled and carried along without the possibility of escape. Want of water is said to be the cause of these migrations, but Dr Livingstone thinks that there must be other causes.

The occasional incursions of wolves, in very severe winters, into districts in which they are not commonly found, and the long excursions of large groups of monkeys (*Entellus* and *Rhesus*), hardly fall within the scope of this article.

Many of the cetacea are probably migratory. "The migrations of the Porpoise (*Phocaena communis*) appear—says Marcel de Serres in his prize-essay, "Des Causes des Migrations des divers Animaux," p. 63—to be as periodic as those of certain species of birds. During the winter, they constantly proceed from north to south; and when they feel the warmth of summer, they turn northwards. Thus they are common in summer in Greenland, while they are rare on our own coasts, where they abound in winter."

The number of species of birds that periodically migrate is so great that it is impossible to find space for a list of them. Marcel de Serres, in the work already quoted, gives a "Tableau de l'Epoque des Passages des Oiseaux," which extends over nearly 100 pages. See BIRDS OF PASSAGE. The desire for a suitable temperature, and the search for their proper food, are the apparent causes stimulating birds to these migrations; and in most instances, especially in the case of insectivorous birds, the food is intimately associated with the temperature.

The migrations of many species of fishes are as remarkable for their regular periodicity as those of birds. In some cases, fishes that are produced in fresh-water streams migrate to the ocean, and after spending some time in salt water, return (generally, with singular instinct, to their own birthplace) to fresh water to propagate their species. Some of these fishes—as, for example, the Lamprey (*Petromyzon marinus*)—spend most of their lives at sea, and others, as the salmon, in fresh water. The remarkable migrations formerly, but erroneously supposed to be made by herrings, are noticed in the article on that fish. Many fishes of the same family as the herring, the *Clupeidae*—as, for example, the sprat and pilchard—leave the deep sea for shallow water during the spawning period, when they approach our coasts in vast shoals. All such migrations as these seem mainly due to a reproductive impulse. See FISHES, LAND-CRAB.

Amongst insects, the Locust (*Locusta migratoria*) is most remarkable for its migrations. These insects are probably produced much more abundantly some years than others, and as in such years their birthplace cannot afford them sufficient vegetation, they are led to migrate in search of food. Some idea of the occasional extent of their wanderings may be formed from the fact that, in the early part of 1816, myriads of locusts appeared in Bengal, from whence they proceeded westward completely across the great Indian peninsula to Guzerat and the neighboring provinces, from whence they pursued their course southwards towards Bombay, the whole period of their migration extending over between two and three years; while,

Miguel  
Milan

68

in relation to their numbers, Captain Beaufort calculated a swarm that appeared at Sardinia, in Asia Minor, in 1811, at upwards of 168,000,000,000,000.

**MIGUEL**, Dom Maria Evarist, born at Lisbon 26th October 1802, was the third son of John VI. of Portugal. He spent his early years in Brazil, unrestrained and uneducated. When he returned with the royal family to Portugal in 1821, he could neither read nor write, and shewed no talent for anything but fencing. He joined his mother, Charlotte Joachime of Spain, in her plots for the overthrow of the constitution and the establishment of a despotic government; part of the scheme being, that his weak father should be either formally deposed, or virtually deprived of all power. The aged Marquis of Loulé, the faithful servant of the king, having been removed out of the way by assassination, M., as Infant-generalissimo, caused the ministers to be arrested, 30th April 1824, and his father to be closely watched in his palace; but the plot failed, and M. and his mother were banished. He led for some time a remarkably wild and profligate life in foreign countries. After the death of his father in 1826, the queen's party set forth a claim to the throne on his behalf, as his elder brother, Dom Pedro, was emperor of Brazil; and on 2d May 1826, Pedro resigned the crown of Portugal in favor of his eldest daughter, Donna Maria da Gloria, proposing that her uncle Miguel should be her husband, and regent of the kingdom till her majority, to all which M. agreed. But Queen Johachime's party had everything prepared for the restoration of absolutism. M. was declared king of Portugal. War ensued, and at first M. was victorious. He carried into full effect the principles of his party by a system of the most severe repression of all liberalism, and signalised himself by the most extreme tyranny of every kind, whilst his own life was one of the wildest excess. In 1832, Dom Pedro took Oporto, and his arms gradually prevailing, M. was obliged to sign a capitulation at Evora, on 26th May 1834, by which he resigned all claim to the throne of Portugal, and agreed to retire altogether from the country. But scarcely had he been conveyed to Genoa, when he protested against this deed, and consequently all his estates in Portugal were confiscated, and an annual pension which had been secured to him was stopped. He went to Rome, where the papal government acknowledged him as rightful king of Portugal, solely because he had petted the Portuguese priesthood in his war against the national liberties. Latterly he lived at the castle of Brounbach, in Baden, where he died Nov. 1866.

**MIKLOSICH**, Franz, the most learned living Slavist, was born at Lutzenberg, in the Slavic part of Styria, 20th November 1818. After studying law at the university of Grätz, he went, in 1838, to Vienna to practise as an advocate; but in 1844 obtained a situation in the Imperial Library. In 1860, he was appointed Professor of Slavic in Vienna. His principal works are—"Radices Lingue Palæoslovenicæ" (Leip. 1845); "Lexicon Lingue Palæoslovenicæ" (Vienna, 1850); "Vergleichende Grammatik der Slaw. Sprachen" (1852—1871), a work which has done for Slavic what the works of Grimm and Diez have done for German and Romanic. "Die Bildung der Slaw. Persouennamen" was published in 1860; and "Die Zigeuner Europas" in 1872—77.

**MIK'NIA**, a genus of plants of the natural order *compositæ*, nearly allied to *Eupatorium* (q. v.). The heads of flowers are 4-flowered, and have four involucrel leaves. *M. officinalis* is a Brazilian species, with erect stem, and heart-shaped leaves, abounding in a bitter principle and an aromatic oil, and valuable as a tonic and febrifuge. *M. Guaco* and *M. optifera*, also natives of the warm parts of South America, are among the plants which have acquired a high reputation—deserved or undeserved—for the cure of snake-bites. They are twining herbaceous plants. *M. Guaco* is remarkable for the large indigo-blue spots on the under side of its ovate leaves. The mode of using this plant, which is one of those called *Guaco*, or *Huaco*, by the Indians, is by dropping the juice of the fresh leaves into the wound made by a serpent; or little cakes are formed of the bruised plants, which are said to retain their power for a long time. The whole subject requires investigation.

**MI'KLOS** (Sr) **TOROK**, a town of Hungary, in the county of Heves, near the Theiss, about 70 miles south-east of Pesth, with which it is connected by railway. Pop. (1869) 13,024, chiefly employed in rearing horses and cattle, and in fishing.

**MI'KNAS**, Mc'quinez, or Meknazza, a town in the province of Fez, in Morocco, 33 miles west-by-south from the town of Fez, stands in a fertile valley near the Sebou.

It is surrounded by triple walls and a moat, is neat and well built, and contains the finest imperial palace in Morocco. This vast pile, erected by the Sultan Muley Ismail, is built of marble, and the surrounding grounds are laid out in gardens, said to be the most beautiful in Morocco, and here and there adorned with fountains. M. is the summer residence of the sultan. Pop. estimated at from 15,000 to 55,000, who carry on an extensive trade in native produce. The chief manufactures are of painted earthenware and leather. In the vicinity are large plantations of olives.

MILAN (Ital. *Milano*), the chief city of Lombardy, stands on the river Olona, in the centre of the great plain of Lombardy. Pop. (1872) of city, 199,009; of surrounding district, called *Corpi Santi*, 62,976. From its position on the line of the chief routes of the central Alps, it derives great commercial advantages, while its fine canal system opens for it communication with the principal rivers of Italy. The *Naviglio Grande*, or Grand Canal, connects M. with the Ticino, and the Martesana Canal with the Adda. The city, which is almost circular, is encompassed on three sides by walls and low ramparts; it has a circuit of about 7½ miles, and is entered by 10 gates. Notwithstanding its great antiquity, M. possesses but few remains of its early splendid structures, in consequence of the many calamitous wars by which it has been ravaged. Modern M. is one of the most opulent and populous cities of Italy; its best streets are regular, wide, and well paved, and kept with scrupulous care; the dwellings are commodious and tasteful, though of a less imposing character than the great feudal Tuscan houses. M. abounds in churches worthy of note: of these, the principal is the famous Gothic cathedral, the *Duomo*, which, with the exception of St Peter's in Rome, is the most magnificent ecclesiastical structure of Italy. It has a façade of white Carrara marble, and is adorned by 106 pinnacles, and 4500 statues, besides a variety of carvings of unsurpassable beauty. In form, it is a Latin cross, with a length of 485, and a breadth of 252 feet. The height of the dome is 355 feet. Its foundation was laid in 1386 by Gian Galeazzo Visconti, and during its erection, many of the greatest European architects contributed designs for its embellishment. Within it, Napoleon was crowned king of Italy in 1805. Besides the *Duomo*, may be mentioned the church of St Ambrose (founded by that saint in the 4th c.), the most ancient in M., containing inscriptions, sarcophagi, and monuments full of antiquarian interest, and the one in which the German emperors were crowned kings of Italy; the Dominican church of *Santa Maria delle Grazie*, which contains in its refectory the famous "Cenacolo," or "Last Supper," by Leonardo da Vinci; and that of San Carlo Borromeo (1847); of St Nazaro, which possesses several master-pieces of the best schools of Italian art; and of St Sebastiano, once a Roman temple.

Among the secular buildings of M., the most noteworthy is the magnificent Brera Palace, formerly a Jesuit college, and now used for public schools of the fine arts, with the official name of Palace of Arts and Sciences. Within its vast precincts, this unique institution includes an academy of art, a choice gallery of paintings, of the Bolognese and Lombard schools, a fine collection of casts for modelling purposes, a splendid public library, containing 140,000 volumes, and a rare collection of manuscripts, medals, and antiquities; it has also attached to it an observatory and a botanical garden. Besides the Ambrosian (q. v.), there are several large private libraries. Among the scientific and artistic institutions of M., are the Museum of Natural History, the schools of surgery and medicine, especially that of veterinary practice, the celebrated Conservatory or school of music, and a military geographical institute, well known for the excellence of the maps it has issued. The educational establishments include four gymnasia, besides normal schools, technical schools, conventual schools, and a seminary. The charitable institutions are numerous and splendidly endowed, having an aggregate property of upwards of £7,000,000 sterling; the *Ospedale Maggiore*, or Great Hospital founded by the ducal house of Sforza in 1456, accommodates 2000 patients, and annually admits upwards of 20,000. The Trivulzi Hospital, endowed by the Trivulzio family, maintains and clothes 600 aged pensioners. The Milanese places of amusement are on as grand a scale as the other public buildings of the city, the first in point of celebrity being the theatre of *La Scala*, which can accommodate 3600 spectators. The *Corso*, or chief street of M., is the universal fashionable promenade of the inhabitants; and the famous arcade, or *Galleria di Cristoforis*, with its brilliant shops and cafés, is also a favorite place of evening resort, and on account of its gay

Milazzo  
Milford

70

appearance has been called "Little Paris." M. carries on an immense inland trade in silk, grain, rice, and cheese, and has considerable manufactures of silk goods, ribbons, cutlery, and porcelain.

M. (Lat. *Mediolanum*) was originally a town or village of the Insubrian Gauls. It was conquered by the Romans 223 B.C., received the Latin franchise about 89 B.C., and the full Roman franchise 49 B.C. Under the Romans, it became a conspicuous centre of wealth and civic influence; its citizens were noted for their refined manners and literary tastes, and the public buildings for their beauty and elegance. In the beginning of the 4th c., it was selected as the residence of the Imperial court by Maximian. M. was sacked by the Huns (under Attila) in 452, by the Goths (under the brother of Vitiges) in 539, and passed to the Longobards and Franks previous to its subjection by the German empire. After 961, it was long governed by dukes in the name of the emperors. The feuds of the Guelphs and Ghibellines distracted M., like all the other Italian cities. Supreme power became eventually vested in the Ghibelline Visconti, by whom the ascendancy of M. was extended over the whole of Lombardy. From 1545 to 1714, M. submitted to the successive predominance of France and Austria. Under Bonaparte, it was declared the capital of the Cisalpine Republic, of the Italian Republic, and, finally, of the Kingdom of Italy. In 1815, M. was restored to Austria, and continued the capital of the Austro-Italian kingdom until the annexation of Lombardy to Piedmont, in 1859, by the peace of Villafranca.

MILAZZO (anc. *Mylæ*), fortified seaport on the north coast of the island of Sicily, 18 miles west of Messina. Pop. (1872) 7744. Its situation is unhealthy. The chief exports are tunny, wine, silk, fruits, corn, oil, and liqueurs. The town is irregularly built, and is considered almost impregnable, owing to the great natural strength of its position and the extent of its military works and citadel. Garibaldi, with 2500 men, defeated 7000 Neapolitans here on the 20th of July 1860, and compelled the garrison to evacuate the fortress.

MILDEW (Ger. *Mehlthau*, meal-dew), a term of somewhat vague application to certain diseased states of plants caused or characterised by the growth of small parasitical fungi, and also to spots on cloth, paper, &c., and even on the surface of glass and other inorganic substances, produced by the growth of minute fungi. The mildew fungi are numerous, and the name mildew is often given to many that are also known by other names, as BLIGHT, BRAND, BUNT, RUST, &c.; see these heads; see also BOTRYTIS and OIDIUM. Different species or families of plants have their own peculiar parasites; several kinds of parasitic funguses being, however, often known to infest one plant. Probably, the name mildew originally belonged to those moulds which form white mealy patches on leaves. Some of these belong to the genus *Erysiphe*, which exhibits fleshy somewhat gelatinous masses, becoming globose *sporangia*, filled with spore-containing *asci*, and surrounded by a fleshy *mycelium*, often spreading widely over the leaves and other parts of plants. Maples are sometimes covered with a mildew of this kind, so as to be quite hoary. Similar mildews are often seen on pease and other leguminous plants; also on umbelliferous plants. Sulphur has been found effectual in curing some of these mildews. Many of the most destructive mildews are of a red or brown color, as the mildew of the pear, *Aecidium cancellatum*, that of the barberry, *Aecidium Berberidis*, &c.; whilst some are almost black, as the corn mildew, *Puccinia graminis*, by which the crops are in some years greatly injured.

Whether mildew is the consequence of unfavorable weather and of fungi attacking an already weakened plant, or is the consequence of infection by spores of fungi brought through the air or soil to a plant previously healthy, is not yet well ascertained; and probably the one may be sometimes the case, and sometimes the other. There is no doubt that many kinds of mildew appear chiefly towards the close of summer on leaves in which vegetable life has already in a great measure lost its power.

MILE, the largest terrestrial measure of length in common use among the British and most continental nations, is derived from the Roman *milliare*, which contained 1000 paces (*mille passuum*) of 5 Roman feet each, the pace being the length of the step made by one foot. The Roman foot being between 11.65 and 11.62 English inches, the Roman mile was thus less than the present English mile

hy from 142 to 144 yards. The length of the modern mile in different countries exhibits a remarkable diversity, not satisfactorily accounted for. Before the time of Elizabeth, scientific writers made use of a mile of 5000 English feet, from the notion that this was the Roman mile, forgetting the difference in value between the English and Roman foot. The present statute mile was incidentally defined by an act passed in the 35th year of the reign of Elizabeth to be "8 furlongs of 40 perches of  $16\frac{1}{2}$  feet each"—i. e., 1760 yards of 3 feet each; and it has since retained this value. The *geographical or nautical mile* is the 60th part of a degree of the equator, and is employed by the mariners of all nations; but in Germany, the geographical mile denotes 1-15th part of a degree of the equator, or 4 nautical miles. The following table gives the length, in English statute miles, of the various miles that have been or are commonly used:

	Eng. Miles
English geographical mile.....	— 1-153
German geographical mile.....	— 4-611
Tuscan mile.....	— 1-027
Ancient Scotch mile.....	— 1-127
" Irish mile.....	— 1-273
German short mile.....	— 3-597
Prussian mile.....	— 4-680
Danish mile.....	— 4-684
Hungarian mile.....	— 5-178
Swiss mile.....	— 5-201
German long mile.....	— 5-753
Hanoverian mile.....	— 6-563
Swedish mile.....	— 6-648
The French kilomètre.....	— 0-621

and 29 kil. = 18 English statute miles nearly.

**MILETUS**, anciently, the greatest and most flourishing city of Ionia, in Asia Minor. It was situated at the mouth of the Meander, and was famous for its woollen manufactures, and for its extensive trade with the north. Before being forcibly colonised by the Ionians, it appears to have been inhabited by Carians. M. early founded a number of colonies on the Black Sea and in the Crimea, possessed a fleet, which sailed to every part of the Mediterranean, and even ventured into the Atlantic, and maintained long and expensive wars with the Lydian Kings. The "Milesians" were believed to be the purest representatives of the Ionians in Asia. After the conquest of Lydia by the elder Cyrus, it was subdued with the whole of Ionia. It continued, however, to flourish till it was excited to rebellion against the Persians in the Ionian war, and was destroyed 494 B.C. It was rebuilt, but never reacquired its former importance. M. has an honorable place in the history of Greek literature, being the birthplace of the philosophers Thales, Anaximander, and Anaximenes, and of the historians Cadmus and Hecataeus.

**MILFORD**, a parliamentary borough (contributory to Pembroke) and seaport of South Wales, in the county of Pembroke, on the north shore of the Haven of the same name, 7 miles east-north-east of St Ann's Head. The Haven is said to be unequalled as a harbor by any other in the world. It is formed by an estuary running inland for 17 miles to Langwin (which is easily reached by vessels of 2000 tons), and varying from 1 to 2 miles in breadth. It is protected from winds by a girdle of undulating hills, is deep (from 15 to 19 fathoms in most parts, while the spring-tides rise 25 feet), easy of access, and capable of anchoring the whole fleet of England in safety. Its distance, however, from the Channel, the highway of British commerce, is a serious disadvantage. The merits of the Haven have been recognised from the earliest times; but the rise of the town of M. may be said to have begun with the present century, when docks and quays, together with a mail-packet station for Ireland, a dockyard, ship-building slips, and an arsenal, were established here, only, however, to be removed in 1814. Since that time, with only occasional gleams of prosperity, M. has been in a declining condition; but the opening of the Milford Railway, and the construction of docks and wharfs, have given an impetus to its progress; though the trade of the place is little developed as compared with the capabilities of the haven and the mineral resources in the neighborhood. In 1875,

Milford  
Military

72

1262 vessels, of a burden of 268,804 tons, entered the port, and 1173, of 228,030 tons, cleared. Pop. (1871) 2536.

MILFORD, a village of Massachusetts, United States of America, 34 miles south-west of Boston, having 6 churches, a manufactory of machinery, and large boot and shoe manufactures. Pop. (1870) 9390; (1890) 9,810.

MILHAU, or Millau, a town of France, in the department of Aveyron, in a rich and fertile dale on the right bank of the Tarn, 55 miles north-west of Montpellier. During the 16th and 17th centuries, it was one of the strongholds of the Calvinists. Leather and gloves are manufactured, and there is a good trade in wool, timber, hides, cheese, and wine. Pop. (1876) 14,482.

MILITARY ACADEMY, Royal, an establishment at Woolwich, through which must pass all candidates for the Royal Artillery and Royal Engineers. The age for entrance is 17, and the vacancies are open to public competition. The pupils are denominated military cadets, and the parents or guardians have to make a considerable payment in regard to each, so long as they remain at the Academy; the annual charge for the son of a civilian being £120, that for the son of a naval or military officer less, according to the rank of the father. When the term of instruction—which comprises the subjects of a thorough general education, the higher mathematics, fortification, gunnery, and military duty—is completed, the cadets compete for the vacancies in the Engineers and Artillery, those who pass the best examination being allowed the refusal of the former corps. Those who obtain commissions in the Engineers proceed to Chatham for further instruction (with military pay, however) in their professional functions. The Artillery cadets at once join the Royal Artillery as lieutenants. The vote for the Royal Military Academy for the year 1876–1877 was £30,825, of which sum about three-fourths would be made up to the Exchequer by the payments for pupils and a contribution from the Indian government.

MILITARY ASYLUM, Royal, an educational government institution at Chelsea, near, but wholly distinct from, the Royal Hospital for Pensioned Soldiers. Its object is the suitable education for trade, &c., of 600 male children—generally orphans—of British soldiers. For these, there are a model school and an infant school, and the boys have a completely military organisation, with scarlet uniform, band, &c. As a result of their training, a large proportion of the pupils ultimately volunteer into the army. The school was originally established in 1808 by the late Duke of York, whence it is still commonly known as the "Duke of York's School." Originally a similar school for soldiers' daughters was included, but was not found to answer, and has been discontinued. Attached to the school is a training establishment for military schoolmasters, known as the Normal School. The total cost of the whole institution is about £11,500 per annum.

MILITARY FRONTIER (Ger. *Militärgrenze*), the former name of a narrow strip of land along the Turkish frontier of the Austro-Hungarian Empire. It had a special military constitution, and formed a separate "crownland." Of late, however, the peculiar constitutions of the M. F. have been abolished; portions of the territory have been incorporated with adjoining provinces; and since 1873 the remainder of the M. F., now officially termed the Croato-Slavonic Border-land, forms, along with Slavonia and Croatia, a dependence of the Hungarian Crown. The constitution, civil and military, is now accordingly similar to that of the other provinces of the Hungarian part of the Empire. The area of the M. F. was about 7500 square miles, and its pop. in 1869 was 699,300. The breadth of the territory once under this name is considerable towards the western extremity, but diminishes to only a few miles at the eastern. The surface has an average elevation of upwards of 2000 feet. All the important rivers flow eastward. The climate is severe in the highlands in the west, but mild in the lower districts towards Slavonia. Maize, wheat, oats, fruits, and vegetables are the principal productions.

The M. F. owes its origin as a crown-land to the necessity of having a permanent body of defenders on the borders during former wars, and especially during wars with the Turks. In the 15th c., the Austrians had gained from the Turks certain tracts of territory on the banks of the Save and Danube. These tracts they colonised, making it, however, a condition that the colonists must render military service.

against the Turks. Thus originated the Capitanate of Zengg, during the reign of Mathias Corvinus. The Warasdin Frontier originated in the same manner in the 16th, and the Banat Frontier in the 17th c. The constitution of the M. F., as it existed till 1873, has been thus described: "The military stations along the frontier serve a threefold purpose—the defence of the country, the prevention of smuggling, and the prevention of the spread of contagious disease into the territories of the Austrian empire. The inhabitants of this crown-land enjoy peculiar privileges. Their immigrant ancestors received only the temporary use of lands consigned to them; but in 1850, a law was passed making over the land to the occupiers as their own property. This right of property does not belong, however, to individuals, but to the family in a vulted sense. The oldest member of a family (called the *Hausvater*) is intrusted with the management of the land; his partner (the *Hausmutter*) ranks equal with him, and they each receive a double share of the profits for the year, as recompense for the management of the estate. A family of this sort is called a Border-house (*Grenzhaus*). All who are able to bear arms are sworn to the service from their 20th year. The soldier of the frontier, who is clothed as well as armed and supplied with ammunition by government, finds it his duty not only to watch and protect the frontier, but to preserve peace and order in the interior, and to go on foreign service when required. Only the smaller portion of the forces of the M. F. is retained in readiness for active service, while the remainder pursue their ordinary employments. To facilitate the accomplishment of the purposes aimed at by the M. F., the *cordon*, a series of guard-houses along the whole frontier, affording accommodation to from four to eight men, as well as larger ones, accommodating twelve men and a junior officer, has been instituted. Within this line are the officers' posts. Without announcing himself at the posts, no one is allowed to pass the boundary; and after permission is given, the passenger must remain a longer or shorter time at the quarantine establishment, in order that all introduction of disease may be prevented.

**MILITARY ORDERS**, religious associations which arose from a mixture of the religious enthusiasm and the chivalrous love of arms which almost equally formed the characteristics of medieval society. The first origin of such associations may be traced to the necessities of the Christian residents of the Holy Land, in which the monks, whose first duty had been to serve the pilgrims in the hospital at Jerusalem, were compelled, by the necessity of self-defence, to assume the character of soldiers as well as of monks. See JOHN (St), KNIGHTS OF. The order of the Templars (q. v.) was of similar origin. Those of Alcantara and Calatrava in Spain had for their immediate object the defence of their country against the Moors. These orders, as well as that of Avis in Portugal, which was instituted with a similar view, followed the Cistercian rule, and all three differed from the Templars and the Knights of St John in being permitted by their institute to marry once. The same privilege was enjoyed in the Savoyard order of Knights of St Maurice and the Flemish order of St Hubert. On the contrary, the Teutonic Knights, who had their origin in the Crusades (see GRAND MASTER), were bound by an absolute vow of chastity. With the varying conditions of society, these religious associations have at various times been abolished or fallen into disuse; but most of them still subsist in the form of orders of knighthood, and in some of them, attempts have recently been made to revive, with certain modifications, the monastic character which they originally possessed.

**MILITARY SCHOOLS**, as regards the British army, are divisible into several classes: 1. Those for the education of officers already in the service; of these, there are the Staff College (q. v.), and the establishment at Chatham for training Engineer officers. 2. Professional schools common to officers and men will be found under GUNNERY, SCHOOL OF, and MUSKETRY, SCHOOLS OF. 3. Schools for the professional education of candidates for commissions; for these, reference should be made to MILITARY ACADEMY, ROYAL, and to SANDHURST MILITARY COLLEGE. 4. The schools for men in the ranks and for their children are described under SCHOOLS, REGIMENTAL; while the instruction provided for their sons or orphans is shown under MILITARY ASYLUM, ROYAL.

The Military Schools of foreign countries deserve considerable attention, especially those of France, where a military commission is one of the best scho-

lastic prizes looked forward to. In France, no attempt is made to impart general education at the military seminaries; a boy is required to have a thorough general knowledge before he can be admitted to these institutions. Being open to universal competition, and being the only channel—or nearly so—to the best employment under the state, the great military schools, by the high standard required for them, give great impetus to general education throughout the empire, and the Lycées, or public schools, adapt their course of instruction to the anticipated competition. In the army, two-thirds of the line commissions, and one-third of those for the scientific corps, are given to non-commissioned officers, but very few of these rise beyond the rank of captain; the remaining commissions in the line and scientific corps, and all appointments to the staff, are given by competition, after a careful course of professional education. The candidates in open competition are placed according to merit either in the Infantry School of St Cyr, or the celebrated Polytechnique; at both colleges, they have the right, if they need it, to partial or entire state support. From the School of St Cyr, the more promising pupils pass to the Staff School, and thence, after a thorough course, to the *Etat Major* of the army; the remaining students pass as subalterns into the line. The pupils of the Polytechnique, which is entered after the age of 17 years, have annually about 160 valuable prizes open to them. The first 80 to 40 candidates usually select civil employment under the state, such as the "*Ponts et Chaussées*;" those next in merit choose the Artillery and Engineers, and pass through a technical course at the School of Application. The remaining students either fail to qualify, and leave the school, or have to content themselves with commissions in the line, subordinate situations in the government, civil or colonial service, or they retire into civil life altogether.

In actual service, there are schools for the men, who are also taught trades and singing. The standard of education among French soldiers is far higher than among their English brethren, as the conscription draws the men from all classes of society.

The Prussian system of military education differs from that of France in that competition is but sparingly resorted to; and the object is to give a good general and professional education to all the officers, rather than a specially excellent training to a selected few. Aspirants for commissions must enter in the ranks, and within six months pass a good examination in general and liberal knowledge; if, however, the candidate has been educated in a cadet-house—which is a semi-military school for youths—and has passed properly out of it, this examination is dispensed with. After some further service, the aspirant goes for nine months to one of three "*Division Schools*," where he completes his professional education. If he pass the standard here required, he is eligible for the next vacancy, but cannot be commissioned, unless the officers of the corps are willing to accept him as a comrade. The Artillery and Engineer schools do for those services what the Division schools do for the line. The culmination of Prussian military education is the Staff School, open to competition for all the officers of the army, and presenting the highest prizes in the profession. In all the schools, the candidates study at the expense of the state, or receive great auxiliary grants.

The Austrian system is very elaborate, and commences at an early age—boys intended for military service beginning their professional, almost contemporaneously with their general education. There are schools for training for non-commissioned officers and for officers; and senior departments for imparting more extended instruction to both classes. Candidates for appointment as non-commissioned officers pass by competition through the lower houses, where they remain till 11 years old; the upper houses, which detain them till 15; and the school companies, whence, after actual apprenticeship to service, a few pupils pass to the academies for aspirants for commissions, and the others are draughted into the service as non-commissioned officers. For officers, boys are pledged to the service by their parents at the age of 11, when they are placed in cadet-schools; after which, the state takes charge of them. At about 16, the boys pass, according to qualification, to the line or scientific corps academies; and four years later, into those services themselves. The young officer's chance of entering the Staff School—and therefore the staff—depends upon his place at the final academic examination. The competition observed throughout the course of military education is said to impart great vigor to the tuition.

In the Italian army, the system so nearly approaches that of France, that a separate description is unnecessary. It need only be stated that the educational status of the Italian officers is considered high.

**MILITARY SECRETARY**, an officer on the personal staff of generals in high command. His duties are to conduct the correspondence of his chief, and to transact a great amount of confidential business, which would dangerously occupy the time of the general himself. The military secretary to the officer commanding-in-chief at the War Office receives £1500 per annum, and is usually a general officer. The military secretary to a commander-in-chief in the field is for the most part below that rank, and receives only the staff pay of £346, 15s.; while to a general commanding a division only, an *Assistant Military Secretary*, at £173, 7s. 6d. per annum, is allowed. This staff pay is of course additional to the officer's regimental or unattached pay.

**MILITARY TRAIN**, formerly a highly important corps of the army, of which the function was to transport the provisions, ammunition, and all other matériel, together with the wounded in time of battle. It was formed after the Crimean war, on the dissolution of the Land-Transport Corps (q. v.). It comprised six battalions, in all 1840 officers and men; and its annual cost for pay, &c., was about £71,000. The corps ranked after the Royal Engineers, and was classed as Mounted Infantry, the officers receiving infantry rates, and the men cavalry rates of pay. The commissions were purchasable, as in the line. The men were armed with carbine and sword, but rather for defensive than aggressive purposes. Attached to each battalion were 166 horses, with proportionate wagons and ambulances.

It is proper to observe that the Military Train constituted only the nucleus of a transport service for a large army, and that in time of war it would be expanded by the addition of thousands of horses or mules, and the incorporation of many hundred drivers, &c. The advantage of possessing even a few men ready trained, and capable of directing the movements of others, was amply demonstrated by the failures of the Crimea in 1854—1856; so that parliament voted ungrudgingly the expense of this corps, although in time of peace it was comparatively without employment. The Military Train was disbanded in 1870, as being too military in its formation. Its functions were transferred to the Transport section of the Army Service Corps, a purely non-combatant organisation.

**MILITELLO**, a city of Sicily, in the province of Catania, and 21 miles south-west of the town of that name. Pop. (1872) 9978. It stands on a mountain in a somewhat unhealthy situation. In its vicinity there are important salt lagoons.

**MILITIA** (Lat. *miles*, a soldier) has now the acquired meaning of the domestic force for the defence of a nation, as distinguished from the regular army, which can be employed at home or abroad in either aggressive or defensive operations. Every nation has a reserve, under its law military, upon which its defence would fall, on the discomfiture of the regular army; but the system differs in each country, and with the exception perhaps of the United States during peace, none are formed on the model of the British militia.

The militia is a constitutional force raised under the sanction of parliament, in which the people—in theory, at least—wage their own bodies for the defence of their own soil, and in which they depnte the sole leadership and command to the sovereign and the crown nominees. Organised by counties and cities, it is essentially a local force: the selection of candidates for first commissions by the lord-lieutenant of the county connects it with the land, while the command of the sovereign effectually combines in it the interests of the three estates. Under the Anglo-Saxons, all men were required to bear arms, as a sort of body-rent for the land they held; but no special organisation being adopted, efficiency was rarely attained in the use of arms. This the nation found to its cost when the Danes overran it during Alfred's reign. That great king, to prevent a similar occurrence, established the militia or *fryd*, making land the basis of numbers, but the family system that of discipline: so many families were a tithing, ten tithings a hundred, and hundreds were united into county powers, each under its *heretoch*, *dux*, or duke. Each section of the community had not only to furnish its quota in time of war, but also to provide arms, keep them in repair, and to undergo so many days' training every year. This arrangement subsisted in more or less vigor until the Conquest; then the feudal troops at first

rendered the militia unnecessary; but it never ceased wholly to exist. When the crown began to contend with the Norman barons, it naturally found its most powerful instrument in reviving the Saxon militia, and the English yeomanry became thenceforth the fear of England's enemies, and a guarantee for the gradual enfranchisement of the people. Henry II. established "an assize of arms," at which every holder of land was bound to produce one or more men fully equipped, and capable of fighting in the national defence. The arms were annually inspected, and it was illegal to sell, lend, or pawn them. This annual assembly of the fyrd or militia is first recorded after the Conquest in 1181; by the statute of Winchester in 1285, Edward I. revised the scale of arms for the several ranks. Further alterations to suit the advances in the art of war took place in 1558 (4 and 5 Ph. and M. c. 2). In 1604, James I. (1 Jac. c. 25) abolished the fyrd, and substituted "Trained (commonly called Train) Bands," to the number of 160,000 men—a force partaking of the nature of militia and volunteers, but deficient in discipline and drill. During the civil war of Charles I., the train bands or militia mostly sided readily with the parliament. Up to this time, the command had never by any law been definitely assigned to the crown or to any other body. After the Restoration, the loyal parliament of Charles II. immediately reorganised the militia—essentially on its present footing—and declared as law that "the sole supreme government, command, and disposition of the law is, and by the laws of England ever was, the undoubted right of his majesty and his royal predecessors." As, however, the crown from this time began to depend for its support upon a mercenary army, and as the local status of the militia officers must always render the militia a force dependent on parliamentary influence and ties, the militia was much neglected until 1757, when a large portion of the regular army being absent in the Seven Years' War, it was carefully organised for the defence of the kingdom. Several militia acts have been subsequently passed, but rather with a view to consolidating the militia laws of England, Scotland, and Ireland, and to effect minor changes necessary for the growth of the institution, than to remodel in any essential degree the constitution of the force. The acts under which the militia is now organised are the 42 Geo. III. c. 90 and 91; 49 Geo. III. c. 120; 15 and 16 Vict. c. 50; 17 and 18 Vict. c. 13, 105 and 106; 18 and 19 Vict. c. 57, 100, and 106; and 33 and 39 Vict. c. 69, consolidating previous acts. The present law stands thus: The sovereign appoints lords-lieutenant of counties, who nominate to first commissions in their county regiments. The general commanding in the military district commands the militia force through the colonels of the sub-districts in which the regiments respectively are.

The force to be provided by each county—known as its "quota"—is fixed by government in proportion to the population, &c. The numbers must be provided in some way. In practice, they are raised by voluntary recruitment; but should volunteering fail, a levy by ballot would be made upon all the inhabitants of the locality between the ages of 18 and 35. The power of making this ballot always exists, and would have by law to be enforced, but for the Militia Ballot Suspension Act, which, when the measure is unnecessary, is passed from year to year. Many classes are exempt from the ballot, as peers, soldiers, volunteers, yeomanry, resident members of universities, clergymen, parish schoolmasters, articulated clerks, apprentices, seafaring men, crown employes, free watermen of the Thames; in England, any poor man with more than one child born in wedlock; in Scotland, any man with more than two lawful children, and not possessed of property to the value of £50; in Ireland, any poor man not worth £10, or who does not pay £5 per annum for rent, and has more than three lawful children under the age of 14.

The militia are bound, when called upon by the crown, to assemble annually for any period not exceeding three months, for training purposes; and the government can embody the whole, or part of the force, at any national crisis. The regiments were embodied, almost without exception, during the Russian war of 1854–1856, and to a considerable extent at the time of the Indian mutiny, 1857–1859. The quota of the United Kingdom is 200,000 men, but not above two-thirds of that number can be considered as effective. They may not be sent out of the kingdom, except they volunteer, and then only by special permission of parliament. As a defensive or garrison force, setting free the regular army for aggressive operations, the militia is a most valuable institution; and in times of war, it has ever been found an admirable training-school whence soldiers volunteer into the permanent forces.

A militia volunteer receives bounty, payable partly on joining, and partly in instalments after each training period. When out for training, or embodied for permanent duty, the officers and men receive the same pay as regular troops of corresponding arms of the service, and are under the Mutiny Act and Articles of War, except that no punishment can extend to life or limb. The officers rank with, but junior to, their brethren of the regular army; the great distinction in appearance between regular and militia troops being, that in the former the appointments are all of gold-lace, and in the latter, of silver; the buttons being similarly distinguished. The force is divided into Heavy, Light, Rifles, and Highland Infantry, and into Artillery, the latter being generally limited to coast counties, and being very highly esteemed by the authorities.

The celebrated Local Militia was instituted in England and Scotland in 1808, and suspended in 1816. It consisted of a force for each county six times as numerous as the proper militia quota, comprising, of course, many classes, which, from age or other circumstances, were ineligible for the militia. These troops could only be marched beyond their respective counties in the event of actual invasion. Their numbers reached, in 1811, to 213,000 men.

The cost of the militia for the year 1876-1877 amounted to £1,168,708 for effective services, and £37,401 for non-effective services. As a constitutional precaution, the estimates were formerly prepared—at least nominally—by a committee of the House of Commons; but as the check was of no real advantage, it was abolished by a resolution of the House in 1863, and thenceforward the Minister of War includes the charge among the many services provided for in his department.

MILK is an opaque white fluid secreted by the mammary glands of the females of the class *Mammalia*, after they have brought forth their young, and during the period in which their offspring are too immature to live upon ordinary food. It is devoid of odor, except for a short time after its extraction; is of a slightly sweet taste, most commonly of a slightly alkaline reaction (except in the *Carnivora*, in which it is acid); and its average specific gravity (in the case of human milk) is 1032.

When milk has been allowed to stand for some time, a thick, fatty, yellowish-white stratum (the cream) forms upon its surface. When this is removed, the fluid below (popularly known as "skim-milk") is found to be of greater specific gravity, and of a more bluish-white tint. Milk does not coagulate on boiling, but a membrane or film of coagulated caseine, containing fat corpuscles, forms upon its surface. If milk be allowed to stand for some days exposed to air at the ordinary temperature, it gradually begins to exhibit an increasing acid reaction, from the formation of lactic acid from the milk-sugar; while the caseine becoming coagulated by the action of the lactic acid, is separated in the form of "curds," and the fluid gradually assumes the form of a thickish pulp. The ordinary means of obtaining the caseine (which exists in solution in the milk) in the form of curds is by the addition of a piece of rennet (the dried stomach of the calf), which acts as powerfully as any acid. The curds thus separated form the basis of cheese, while the fluid portion left after their removal is known as the "whey."

The following table, which is based on the researches of Vernols and Becquerel, represents the density and composition of 1000 parts of milk in various animals:

	Density.	Water.	Solid Constituents.	Caseine & Extractive Matters.	Sugar.	Fat (Butter)	Salts.
Woman.	1032.67	899.08	110.92	39.24	43.64	26.66	1.38
Cow ....	1033.38	864.06	135.94	55.19	38.03	26.12	6.64
Mare....	1033.74	904.80	95.70	33.35	32.76	24.86	5.23
Ass.....	1034.57	890.12	109.88	35.65	50.46	18.53	5.24
Goat....	1033.53	814.90	155.10	35.14	36.91	56.87	6.18
Ewe.....	1040.98	832.32	167.63	69.78	39.43	51.31	7.16
Bitch....	1041.63	772.03	227.93	116.88	15.29	87.95	7.80

When examined under the microscope, the milk appears as a clear fluid, containing fat globules (the milk globules, as they are usually called) in suspension.

They commonly vary from .0012 to .0018 of a line in diameter. They are each invested with a delicate coat of caseine, which prevents their running together. By *churning*, the surrounding envelopes become ruptured, and the contents are made to unite, forming *butter*. In addition to milk globules, colostrum globules (see COL-OSTRUM), which are irregular conglomerations of very small fat globules, occur in the milk for three or four days after delivery.

The actual caseine which in the preceding analyses is associated with the undefined group of substances termed *extractive matters*, ranges from 27 to 35 in 1000 parts of healthy human milk, while in the colostrum it amounts to 40; in the milk of the cow it is somewhat higher; while in that of the bitch, and probably of all carnivorous animals, it is more than trebled. It is found in the case of women that the quantity of the caseine increases with the free use of animal food, and diminishes upon vegetable diet.

The fatty matters range from 25 to 43 in 1000 parts of women's milk, while in cows' milk they average, according to Lehmann, 45; and in bitches' milk, rise to 110. These fatty matters, which collectively form butter, consist of an admixture of 68 per cent. of margarine, 30 per cent. of oleine, and 2 per cent. of an admixture of fats, which, on saponification, yield butyric, caproic, caprylic, and capric acids. The milk which is last yielded is much richer in fat than that which is first drawn.

The sugar, or lactine, whose properties are described in the article SUGAR OF MILK, varies in human milk from 32 to 62 in 1000 parts, and in cows' milk from 34 to 43. The milk of bitches, when fed on a purely animal diet, often contains no traces of sugar; but if they are fed on vegetable or mixed food, a considerable quantity of sugar is found. The salts in women's milk range from 0.6 to 2.5 in 1000 parts, and in cows' milk from 3.5 to 8.5. That a peculiar selective power is exerted by the mammary gland, is shewn by the following table, which shews the comparative analysis of the ashes of cows' milk and of cows' blood, each reckoned for 100 parts:

	Ash of Milk.	Ash of Blood.
Chloride of potassium.....	14.18	none
Chloride of sodium.....	4.74	38.82
Potash.....	23.46	11.44
Soda.....	6.96	29.09
Phosphoric acid.....	28.40	7.74
Lime.....	17.34	1.90
Magnesia.....	2.20	0.75

Why the potassium and sodium compounds stand in this inverse relation to one another in these two fluids, is not accurately known. The abundant supply of phosphoric acid, lime, and magnesia in the milk, is doubtless for the purpose of building up the infant skeleton.

The milk is liable to tolerably regular changes at different periods of lactation; for example, the sugar is deficient during the first month, and is in excess from the eighth to the tenth month; the caseine is in excess during the first two months, and is most deficient between the tenth and eleventh month; the butter is considerably in excess during the first month, and slightly so for the next two months; while the salts are most abundant during the first month, but present no regular law of decrease. Hence, it will readily be seen that in the selection of a wet-nurse, one of the leading requirements should be, that her milk should be of the same age as that of the mother's. Various medicines, as, for example, iodide of potassium, iodide of mercury, and quinine, have been detected in the milk, after being taken by the mother; and many cases are on record in which strong mental impressions, as fear or anger, acting on the mother, have so far poisoned the milk as to cause immediate convulsions in the infant.

The daily quantity of milk is dependent upon various conditions, such as bodily constitution, food, &c. Lamporriere determined the quantity of milk secreted in definite times by a large number of women, and found as a mean for each breast between fifty and sixty grammes (the gramme being 15.4 grains) in the course of two hours, assuming that the secretion continues at a uniform rate.

In those cases in which a wet-nurse cannot be obtained, it is expedient to modify cows' milk, so as to make it resemble that of women. The main differences are, that the former contains more caseine, and less sugar and water than the latter. By

exposing cows' milk to a gentle heat in a wide open vessel, we obtain a film of caseine which may be removed (more than once, if necessary); on then adding sugar (sugar of milk, if procurable) and water, we obtain a good imitation of the human secretion.

In the article on *Digestion*, the uses of the leading ingredients of the milk in relation to nutrition are sufficiently noticed. The milk of cows is extensively used as an article of diet both for healthy persons and invalids, and it enters largely into all hospital, prison, and workhouse dietaries. In patients with a tendency to consumption, or in whom that disease has already manifested itself in its early form, cream is often of great service, especially when the stomach cannot bear cod-liver oil.

The adulterations to which milk is often subjected are noticed in the article *Food*, and the instruments used for testing the purity of this fluid are briefly referred to in the article *GALACTOMETER*. Water is by far the commonest adulteration, and if it has been added in large quantity, the fraud may be detected by evaporating a small weighed quantity of the milk (say 500 grains) to dryness, and ascertaining whether the due proportion of solid constituents is left.

Various methods have been proposed for the preservation of milk for sea-voyages, &c. Moore's Essence of Milk is prepared by the addition of a little sugar and the evaporation of the fluid, at a temperature of 110° to one-fourth of its bulk, when it is put in small tin-cases, soldered down, steeped in boiling water for a time, and taken out to cool. This preparation keeps good for a long time. Blatchford's Solidified Milk is prepared by mixing 112 lbs. of milk with 28 lbs. of white sugar and a little bicarbonate of soda. The mixture is evaporated under certain conditions, till it assumes the form of a creamy powder, which is cooled, weighed into parcels of 1 lb. each, and compressed into brick-shaped masses, which must be triturated and mixed with warm water when required for use. Grimwade's De-siccated Milk is prepared by mixing the fluid with a little sugar and alkali, and evaporating it till it is as thick as dough; it is then dried, crushed and bottled. At the meeting of the British Association in 1859 Abbé Moigno described four methods employed in France for the preservation of milk, of which the most valuable seemed those of Maber and De Pierre. For details regarding these methods, we must refer to the abbé's paper. He found milk prepared by Maber's process perfectly good after having been kept between five and six years. The milk prepared by De Pierre's process, unlike the other preparation, is liquid. A specimen of it, the age of which was not stated, which the abbé brought to Aberdeen, was found to be perfectly fresh. The preparation of condensed milk is now conducted on a large scale in Switzerland.

**MILK-FEVER**, in the lower animals, comes on within a few days after parturition. One variety, common to most animals, consists in inflammation of the membranes of the womb and bowels, and is produced by exposure to cold, overdriving, or injury during labor; it is best treated by oil and laudanum, tincture of acouite, and hot fomentations to the belly. The other variety, almost peculiar to the cow, attacks animals in high condition, that are good milkers, and have already borne several calves; it consists in congestion and inflammation of the brain and large nervous centres, and impairs all the vital functions, leading to dulness, loss of sensation and motion, and stupor. Blood must be drawn early, whilst the cow is still standing and sensible. Later, it only hastens death. A large dose of physic, such as a pound each of salts and treacle, a drachm of calomel, an ounce of gamboge, and two ounces of ginger, should at once be given, solid food withheld, clisters of soap, salt, and water thrown up every hour, cloths wrung out of boiling water applied along the spine, the teats drawn several times daily, and the animal frequently turned. Although treatment is uncertain, prevention is easily insured by milking the cow regularly for ten days before calving, feeding sparingly on laxative unstimulating food, giving several doses of physic before, and one immediately after calving; and when the animal is in very high condition, and prone to milk-fever, bleeding her a day or two before calving.

**MILK VETCH.** See *ASTRAGALUS*.

**MILKY-WAY.** See *GALAXY*.

**MILKWORT.** See *POLYGALA*.

**MILL.** This word is now used in a general way as a name for almost all kinds of manufactories, as well as for grinding machinery; but we shall only describe here the arrangements of an ordinary flour-mill, adding a brief notice of the edg-mill in use for grinding oil-seeds and some other substances.

From time immemorial, corn has been ground by a pair of stones. The earliest and rudest handmills were no doubt somewhat like one sent home by Dr Livingstone, the African traveller, from the banks of the Shire, in South Africa. He describes it as "a mill such as Sarah used, when told by her lord to do the thing handsomely and in a hurry for the strangers—i. e., a big stone worn hollow by the operations of grinding. The upper stone is grasped by both hands, and the weight of the body brought down on it as it is shoved to the lower part. . . . The meal is made very fine." The next step in advance of this was the quern or handmill, still in use in the Shetland Isles, the Farðes, and other places. The old quern scarcely differs from a pair of modern millstones, except in the stones being small enough to allow of the upper one being turned by the hand, instead of by wind, water or steam power.

The millstones which are now all but universally used for grinding corn are made from buhr-stone, a form of silica like flint in hardness, but not so brittle. This rock is only found in abundance in the mineral basin of Paris and some adjoining districts, and belongs to the Tertiary formation. It is of a cellular texture, and is frequently full of silicified shells and other fossils. Millstones are usually from four to six feet in diameter, and are each made up of a number of pieces strongly cemented and bound together with iron hoops. One six feet in diameter, of fine quality, will cost about £50. The grinding surface of each stone is furrowed or grooved, the grooves being cut perpendicularly on the one side, and with a slope on the other. A pair of stones are used together, and both being furrowed exactly alike, the sharp edges of the grooves on the one come against those on the other, and so cut the grain to pieces.

The figure shows a section of a flour-mill reduced to its simplest elements. The millstones are at *a*, the lower of which is firmly fixed, it being a matter of importance to have this done securely; and the upper is made to revolve, on a shaft which passes up through the lower one, at a speed of one hundred revolutions per minute

more or less. Motion is communicated by the spur-wheel *b*, which is driven by a water-wheel or other power. The corn, previously cleaned, is supplied to the millstones by means of the hopper *c*, connected with which there is a valve, *d*, for regulating the supply. Passing through a hole in the centre of the upper millstone, it comes in between the two, where it is ground, and thrown out on all sides by means of the centrifugal force. The millstones are, of course, enclosed, and the flour passes down through the spout *e*, to the worm at *f*, which, while it cools the ground corn, carries it along to elevators *g*. These raise it up to the floor, on which the silk-dressing machine, *h*, is placed. This is a cylinder, which was formerly made of wirecloth of various degrees of fineness, and consequently separated the flour into different qualities—the finest passing through the first portion, the second passing through the next, and so on; but no part of it large enough in the openings to let through the bran, which passed out at the end. Silk is now preferred to wirecloth for dressing the flour. Hoppers, *i*, are placed below the dressing-machine, by means of which the flour and bran are filled into sacks; No. 1. being fine flour; No. 2. seconds; and No. 3. bran.

One of the largest flour-mills in Great Britain is the one belonging to Messrs Tod at Leith. It is about 150 feet long, 60 feet broad, and 65 feet high. At one end of it is placed a steam-engine of 850 horse-power, which works all the machinery of the mill. This communicates motion to a series of shafts and wheels occupying the ground-floor, belts being used as much as possible for driving the wheels instead of spur-gear, so as to avoid a shaking motion. On the second floor are placed 36 pairs of millstones, arranged in two lines along the room, the wheat being supplied silently to them by centrifugal feeders. On the third floor are situated the hoppers for feeding the millstones. The fourth floor contains iron rollers for partially crushing the wheat before being supplied to the millstones. This floor also contains silk and wire dressing-machines. On the fifth floor are placed the first silk dressing-machine, and also smut-machines for cleaning the wheat previous to grinding, which are somewhat similar to thrashing-machines. The sixth and highest floor also contains smut-machines. All these machines are connected in the most skillful manner by means of elevators ascending through all the floors; and along each, where necessary, there runs, in a horizontal direction, an Archimedean screw, so that the grain or the flour can be conveyed to any of the machines without the assistance of hand-labor.

This mill converts wheat into flour at the rate of about 500 sacks a day of 24 hours—a quantity nearly sufficient to supply bread for the entire population of a city like Edinburgh. [The above description applies to Messrs Tod's mill as it stood in 1863. It was subsequently greatly extended; and, after being destroyed by fire in 1874, has been completely refitted.] The great government mill of St Maur is the most remarkable mill in France.

There is a form of mill in use for some purposes where the millstones are vertical, and called the edge-stone mill. It is sometimes, though rarely, used for grinding corn; but is much employed for crushing oil-seeds and for grinding dyestuffs, sugar, chemicals, and a multitude of other substances. The stones are generally of some hard rock, such as granite or sandstone, and from 5 to 7 feet in diameter. For such purposes as grinding clay or loam, they are usually made of cast iron, and of a smaller size. The stones revolve in opposite directions, sometimes upon a fixed stone or metal bed, and at other times it is the bed-plate itself which revolves, and in so doing turns the edge stones which rest upon it.

Among the recent improvements in our flour-mills which have attracted considerable attention are: 1. The patent process of dressing the grinding surface of the millstones by means of a peculiar kind of diamond, which rapidly covers it with fine grooves. This is still, however, more largely, and perhaps more efficiently, done by the slower process with the nidding hammer; 2. The keeping down of the temperature of the millstones by means of a current of cold air; and, 3. The introduction of Carr's Patent Disintegrator, which grinds wheat and other substances by means of two vertical iron discs about five feet in diameter, and a few inches apart, in each of which are several concentric rows of steel pegs, so arranged that those on the one disc overlap without touching those on the other. The discs are made to revolve rapidly in opposite directions, so as to grind the wheat by percussion.

**MILL**, in Law. The owner of a mill situated on the bank of a stream is entitled to have the use of the stream undiminished in volume; and if the other riparian owners above interfere with the stream by diminishing its volume, thereby causing injury to the mill, the mill-owner has a right of action against the party so acting.

**MILL**, James, was the son of a small farmer, and was born in the neighborhood of Montrose, Scotland, 6th April 1778. He studied, with a view to the church, at the university of Edinburgh, where he distinguished himself in Greek and in Moral and Metaphysical Philosophy. He was licensed to preach in 1799; but instead of following out the ministry, he went to London in 1800, where he settled as a literary man. He became editor of the "Literary Journal," which after a time was discontinued; and wrote for various periodicals, including the "Eclectic" and the "Edinburgh Review." In 1806, he commenced his "History of British India," which he carried on along with other literary work, and published in the winter of 1817-1818. The impression produced by this masterly history on the Indian authorities was such, that, in 1819, the Court of Directors of the Company appointed him to the high post of Assistant-examiner of Indian Correspondence, notwithstanding the then unpopularity of his well-known radical opinions. The business assigned to his care was the Revenue department, which he continued to superintend till four years before his death, when he was appointed head of the Examiner's office, where he had the control of all the departments of Indian administration—political, judicial, and financial—managed by the Secret Committee of the Court of Directors. Shortly after his appointment to the India House, he contributed the articles on Government, Education, Jurisprudence, Law of Nations, Liberty of the Press, Colonies, and Prison Discipline to the "Encyclopædia Britannica." These essays were reprinted in a separate form, and became widely known. The powers of analysis, of clear statement, and of the thorough-going application of principles, exhibited in these articles, had probably never before been brought to bear on that class of subjects. In 1821-1822, he published his "Elements of Political Economy," a work prepared primarily with a view to the education of his eldest son, John Stuart Mill. In 1829, his "Analysis of the Human Mind" appeared. His last published book was the "Fragment on Mackintosh," brought out in 1835. He was also a contributor to the "Westminster Review" and to the "London Review," which merged in the "London and Westminster."

Not long after he settled in London, he made the acquaintance of Jeremy Bentham, and for a number of years lived during the summer in Bentham's country-house. Although he must have derived much benefit from his intercourse with the great law-reformer, he was not a mere disciple of Bentham, but a man of profound and original thought, as well as of great reading, in all the departments of moral, mental, and political philosophy. His conversation was impressive to a remarkable degree, and he gave a powerful intellectual stimulus to a number of young men, some of whom (including his own son, and Mr Grote, the historian of Greece) have since risen to eminence. He took a leading part in the founding of University College, London. He died at Kensington, 23d June 1836. See Autobiography of J. S. Mill, and an interesting Biography by Professor Bain in "Mind," 1876-78.

**MILL**, John Stuart, son of the preceding, was born in London on the 20th of May 1806. He was educated at home by his father. In 1820, he went to France, where he lived for upwards of a year, making himself master of the French language, and occasionally attending public lectures on science. He lived for some time at Paris, in the house of the French economist, Jean Baptiste Say, where he made the acquaintance of many men distinguished then, or afterwards, in letters and in politics. He spent part of his time in the south of France, in the house of Sir Samuel Bentham, brother to Jeremy Bentham. During this stay in France, he laid the foundation of his great familiarity with, and interest in, the politics as well as the literature of the French nation. In 1823, he entered the India House, and became a clerk in the Examiner's office, where his father was Assistant-examiner. For thirty-three years he continued to be occupied in the department of the office named the Political, or the transactions of the Company with the native states. In 1831, he was appointed Assistant-examiner, and in 1836 he was placed at the head of the department. He energetically opposed the transfer of the India government

to the crown in 1868. On the score of failing health he declined a seat at the new Indian Council, and retired from office in October of the same year, on a compensating allowance. At the general election of 1865, M. was returned to parliament for Westminster; and till he lost his seat at the election of 1868, he acted with the Advanced Liberals. He died, May 8 1873, at Avignon, where he had spent most part of the last years of his life.

Mr Mill became an author at a very early age, and may be looked upon as one of the foremost thinkers of his time. His first publications consisted of articles in the "Westminster Review." He took an active part in the political discussions that followed the revolution of 1830 in France, and the Reform-Bill movement in England; and from 1835 to 1840 was editor, and along with Sir W. Molesworth, proprietor of the "London and Westminster Review," where many articles of his own appeared. In 1843, he published his "System of Logic;" in 1844, "Essays on some Unsettled Questions of Political Economy;" in 1848, the "Principles of Political Economy;" in 1859, an essay on "Liberty;" in 1860, "Discussions and Dissertations;" in 1863, a small work on "Utilitarianism;" in 1865, "Comte and Positivism," and the "Examination of Sir William Hamilton's Philosophy;" in 1867 (when M. was rector of St Andrews University), his "Inaugural Address;" in 1868, "England and Ireland;" and in 1869, "The Subjection of Women." After his death appeared his "Autobiography" (1873), read with intense interest; "Three Essays on Religion" (1874); and a second volume of "Discussions and Dissertations" (1875).

MILLAIS, John Everett, R.A., a celebrated English painter, was born at Southampton in 1829, entered the Royal Academy at the age of eleven, and in 1847 carried off the gold medal for his picture of "The Tribes of Benjamin seizing the Daughters of Shiloh," exhibited, in the following year, at the British Institution. Before this period, he had acquired a considerable reputation among younger painters by his avowed antipathy to the principles of art which then prevailed. His views were shared in by other students, such as Holman Hunt (q. v.), Dante Rossetti (q. v.), and Charles Collins, and a sort of artistic fraternity was formed, which obtained the name of the *Pre-Raphaelite School*. M.'s principal paintings are: "Our Saviour" (1850), "Mariana in the Moated Grange" (1851), "The Huguenot" and "Ophelia" (1853), "The Order of Release" and "The Proscribed Royalist" (1853), "The Rescue" (1855), "Autumn Leaves" (1856), "The Heretic" (1858), "Spring Flowers" (1860), "The Black Brunswicker" (1861), "My First Sermon" (1863), "My Second Sermon" (1864), "Joan of Arc" (1865), "Sleeping," "Waking," "Jephtha" (1867), "Moses" (1871), "Chil! October" (1871), "Day Dreams" (1874), "Sound of Many Waters" (1877), &c. Whatever opinions may be held of M. as an *artist*, no respectable critic denies the subtlety of his imagination and depth of sentiment. He is profoundly poetical, and has probably never been surpassed in representing intense feeling and thought by means of color and composition; but his perverse affectation, and contempt for "conventionalism," have marred his finest productions.

MILLEDGEVILLE, the former capital of Georgia, United States of America, on the west bank of the Oconee River, 150 miles north-west of Savannah, in a rich cotton country. Among its edifices are the former governor's residence and state buildings, and several churches. Pop. (1870) 2750; (1880) 3,800.

MILLENNIUM (Lat. a thousand years' time) designates a certain period in the history of the world, lasting for a long indefinite space (vaguely a thousand years), during which the kingdom of Messiah will, according to tradition, be visibly established on the earth. The idea originated proximately in the Messianic expectations of the Jews; but more remotely, it has been conjectured, in the Zoroastrian doctrine of the final triumph of Ormuzd over Ahriman, and was connected by the Christians with the *Parousia*, or Second Coming of Christ. The notion of a Golden Age, preserved by the converts from heathenism to Christianity, as well as the oppression and persecutions to which they were long subjected by the state authorities, were naturally calculated to develop and strengthen such hopes. The chief basis of the millenarian idea in Judaism as well as in Christianity, however, is the ardent hope for a visible divine rule upon earth, and the identification of the church with that of which it is merely a symbol. In the 1st c. of the church, millenarianism (the Greek equivalent of which, *chiliasm*, from *chilioi*, a thousand, is the term em-

played by the Fathers) was a widespread belief, to which the book of Daniel, and more particularly the pictorial predictions of the Apocalypse (chaps. xx. and xxi.), gave an apostolical authority; while certain prophetic writings, composed at the end of the 1st and the beginning of the 2d c.—such as the “Testament of the Twelve Patriarchs,” the “Fourth Book of Edras,” the “Revelation of Saint Peter,” &c.; also the “Christian Sibylline Books,” the “Epistle of Barnabas,” the “Shepherd of the Pseudo-Hermas,” several Midrashim, Targums, and other works of a partly legendary character embodied in the “Talmud”—lent it a more vivid coloring and imagery. The unanimity which the early Christian teachers exhibit in regard to millenarianism, proves how strongly it had laid hold of the imagination of the church, to which, in this early stage, Immortality and future Rewards were to a great extent things of this world as yet. Not only the heretic Cerinthus, but even the orthodox doctors—such as Papias, Bishop of Hierapolis, Irenæus, Justin Martyr, &c.—delighted themselves with dreams of the glory and magnificence of the millennial kingdom. The “Sibylline Books,” for instance, hold that the earth will be cultivated throughout its length and breadth, that there will be no more seas, no more winters, no more nights; everlasting wells will run honey, milk, and wine, &c. &c. Papias, in his collection of traditional sayings of Christ (“Kuriakôn Logiôn Exegésis”), indulges in the most monstrous representations of the rebuilding of Jerusalem, and the colossal vines and grapes of the millennial reign. Every vine will bear 10,000 branches, every branch 10,000 shoots, every shoot 10,000 sprigs, every sprig 10,000 bunches, every bunch 10,000 berries, every berry 84 times 25 gallons of wine; and if a Saint come to pluck a berry, they will all cry out: “Pluck me, O Saviour, I am better, and praise the Lord through me.” The Talmud calculates the height of the men of the millennium to be, as before the Fall, of 200—900 yards; the moon shall be, according to a prophetic dictum, like the sun; the sun shall be increased 843 times; and every Israelite will beget as many children as there were Israelites going out from Egypt—60,000. Each grape will be large enough to fill the biggest ship. Above all, however, the land of Israel will be free again, and the primitive worship restored with unheard-of splendor. “Such a chillsam,” Neander justly remarks, could only “promote a fleshly endaimonism;” and indeed ere long it called into more energetic activity the opposition of Gnostic spiritualism. According to the general opinion, which was as much Christian as Jewish, the millennium was to be preceded by great calamities, reminding us in some degree of the Scandinavian Ragnarök (or “Twilight of the Gods”). The personification of evil appeared in *Antichrist*, the precursor of Christ (identified during the 1st c., with Nero), who would provoke a frightful war in the land of Magog (Ezek. chaps. xxxviii. and xxxix.) against the people Gog, after which the Messiah—some say a double Messiah, one the son of Joseph, vanquished in the strife; the other, the victorious son of David—would appear, heralded by Elias, or Moses, or Melchizedek, or Isaiah, or Jeremiah, and would bind Satan for a thousand years, annihilate the godless heathen, or make them slaves of the believers, overturn the Roman empire, from the ruins of which a new order of things would spring forth, in which the “dead in Christ” would arise, and along with the surviving saints enjoy an incomparable felicity in the city of the “New Jerusalem,” which was expected to descend literally from heaven. To the innocence which was the state of man in Paradise, there was associated, in the prevalent notions of the millennium, the finest physical and intellectual pleasures.

In the Mosaic account of creation, we find the primitive ground for making the victorious era of the church last a thousand years. That account was regarded by the Jews and by the Judaic Christians as a type of the destinies of creation. Now, by a strictly literal interpretation of the 4th verse of the 90th Psalm, it was supposed that a day of God was arithmetically equal to a thousand years; hence the six days of creation were understood to indicate that the earth would pass through 6000 years of labor and suffering, to be followed by a seventh day—that is, 1000 years of rest and happiness. In the Book of Revelation (chap. xx.) this view is presented. Still, the rabbinical traditions differ widely among themselves as to the duration of the happy period. Instead of 1000 years, some of them count 40, 70, 90, 365, 400, 600, 2000, or 7000, or so many years as have elapsed from the creation of the world or the flood. The gospel of Nicodemus makes it 500 years, &c. In

fact, the systems of apocalyptic chronology were of a varied and somewhat arbitrary cast; according as their originators laid greater stress upon the Apocalypse, the Book of Daniel, the Song of Songs, the Jewish "Gematria," or Computation of Letters—a very pliable art in itself—or on astronomy, astrology, "natural phenomena," and the like.

The lapse of time chilling the ardor of the primitive Christian belief in the nearness of the *Parousia*, had without doubt also the tendency to give a more shadowy, and therefore a more spiritual aspect to the kingdom over which the expected Messiah was to reign. The influence of the Alexandrian philosophy contributed to produce the same result. Origen, for example, first started the idea, that instead of a perpetual opposition of Paganism to Christianity—instead of a final and desperate conflict between the two—instead of an insolent triumph on the part of the saints, and a servile submission on the part of the unbelievers, the real progress and victory of Christianity would consist in the gradual spread of the truth throughout the world, and in the voluntary homage paid to it by all secular powers. This was an immense advance on the views previously entertained. It is owing largely to Origen and his disciple Dionysius that more spiritual conceptions of the millennium finally established themselves in the church; at all events, they furnished the Fathers with the majority of their arguments. Yet even in the Egypto-Alexandrian Church, millenarianism, in its most literal form, was widely diffused, and was only eradicated by the great wisdom and moderation of Dionysius. The Montanists (q. v.) generally, as might be expected from the enthusiastic tendencies of the sect, were extreme millenarians or chiliasts, and being considered a heretical sect, contributed largely to bring Chiliasm into discredit, or, at all events, their own carnal form of Chiliasm, which Tertullian himself attacked. Cælius, the Presbyter, in his "Disputation" against the Montanist Proclus, traces its origin to the hated heretic Cerinthus, whom he accuses of forging a certain revelation, which he passed off as the work of an apostle. From his description of this revelation, it is almost certain—strange as it may appear—that he alludes to the canonical Apocalypse, Lactantius, in the beginning of the 4th c., was the last important church Father who indulged in chiliastic dreams, while among its earlier advocates may be mentioned chiefly Nepes, Methodius, Korakion, Apollinaris, Victorinus, &c. In the 6th c., St Jerome and St Augustine expressly combated certain fanatics who still hoped for the advent of a millennial kingdom whose pleasures included those of the flesh. But from this time, the church formally rejected millenarianism in its sensuous "visible" form, although the doctrine every now and then made its reappearance, especially as a general popular belief, in the most sudden and obstinate manner. Thus the expectation of the *Last Day* in the year 1000 A.D. re-invested the doctrine with a transitory importance; but it lost all credit again when the hopes, so keenly excited by the Crusades, faded away before the stern reality of Saracenic success, and the predictions of the "Everlasting Gospel," a work of Joachim de Floris, a Franciscan abbot (died 1212), remained unfulfilled.

At the period of the Reformation, millenarianism once more experienced a partial revival, because it was not a difficult matter to apply some of its symbolism to the papacy. The Pope, for example, was *Antichrist*—a belief still adhered to by some extreme Protestants. Yet the doctrine was not adopted by the great body of the Reformers, but by some fanatical sects, such as the Anabaptists and by the Theosophists of the 17th century. During the civil and religious wars in France and England, when great excitement prevailed, it was also prominent. The *Fifth Monarchy Men* of Cromwell's time were millenarians of the most exaggerated and dangerous sort. Their peculiar tenet was, that the millennium *had* come, and that they were the saints who were to inherit the earth. The excesses of the French Roman Catholic Mystics and Quietists terminated in chiliastic views. Among the Protestants, it was during the *Thirty Years' War* that the most enthusiastic and learned chiliasts flourished. These may—broadly—be brought under the three chief heads of *Exegetical* Chiliasts, who, by some biblical dates, endeavored to compute the predicted time; *Alchemistic* or *Kabbalistic* Chiliasts, who endeavored to hasten the period by some mystical discovery; and *Politico-theocratic* Chiliasts, who wished to reduce the governments of the world to a biblical standard. See ANABAPTISTS, MÜNZER. The awful suffering and widespread desolation of that time, led pious hearts to solace themselves with the hope of a peaceful and

Millepedæ  
Millet

86

glorious future. Since men the penchant which has sprung up for expounding the prophetic books of the Bible, and particularly the Apocalypse, with a view to present events, has given the doctrine a faint semi-theological life, very different, however, from the earnest, practical faith of the first Christians. Among the foremost chiliastic teachers of modern centuries are to be mentioned Ezechiel Meth, Paul Felgenhauer, Bishop Comenius ("Lux in Tenebris," 1657); Professor Jurien ("L'accomplissement des Prophéties," 1686); Serarius ("Assertio du Regne de Mille Ans," &c., ab. 1670); Polret ("Economie Divine," 1687); J. Mede ("Clav. Apocal." 1627); while Thomas Burnet and W. Whiston endeavored to give chiliasm a geological foundation, but without finding much favor. Spener, on account of his "Hoffnung besserer Zeiten," has been accused of chiliasm; no less Joachim Lange ("Licht und Recht"); and Swedenborg employed apocalyptic images to set forth the transfigured world of the senses. Latterly, especially since the rise and extension of missionary enterprise, the opinion has obtained a wide currency, that after the conversion of the whole world to Christianity, a blissful and glorious era will ensue; but not much stress—except by extreme literalists—is now laid on the nature or duration of this far-off felicity. In fact, the common Christian conception of a millennium without a visibly present Christ, as held at the present day, is little different, so far as results are concerned, from the belief of philosophers in the perfectibility of the race. The essence of both conceptions is the cessation of sin and sorrow, the prevalence of holiness and happiness. But this departs widely from the "ancient hope of the church"—a kingdom of visible majesty, with Jesus and the saints ruling the world from Jerusalem, the central city of the earth!

Great eagerness and not a little ingenuity have been exhibited by many persons in fixing a date for the commencement of the millennium. The celebrated theologian, Johann Albrecht Bengel (*Erklärte Offenbarung; Reden für's Volk*), who, in the 18th c., revived an earnest interest in the subject among orthodox Protestants, asserted from a study of the prophecies that the millennium would begin in 1836. This date was long popular. Bengel's general millenarianism was adopted by Oettinger (d. 1783), and widely spread throughout Germany in a more or less poetic form by Hahn, Crusius, Jung Stilling, Lavater, and Hess (*Briefe über die Offend. Joh.*). Some of the greatest of the more recent German theologians are millenarians, such as Rothe, Delitzsch, Hoffmann, Kurtz, Hebart, Thiersch, Nitzsch, P. Lange, and Ebrard. Swedenborg, to whom reference has already been made, held that the last judgment took place in 1757, and that the New Church, or "Church of the New Jerusalem," as his followers designate themselves—in other words, the millennial era, then began. In America, considerable agitation was excited by the preaching of one William Miller, who fixed the second advent of Christ about 1843. Of late years, the most noted English millenarian is Dr John Cumming, who originally placed the end of the *present dispensation* in 1866 or 1867; but as that time drew near without any millennial symptoms, he was understood to have modified his original views considerably, and now conjectures that the beginning of the millennium will not differ so much after all from the years immediately preceding it, as people commonly suppose. See Corrodi's "Kritische Geschichte des Chiliasmus" (Zurich, 1794, 4 vols.); Calixtus, "De Chiliasmo cum antiquo tum pridem renato Helms." (1693, 4to); Klee, "Tentam Hist. crit. de Chil. prim. sœc. Heribip." (1825); Münter, "Dogmengeschichte," &c. A really good history of Chiliasm, however, is as yet a desideratum.

**MILLEPEDE**, a popular name of many kinds of *Myriapoda*, of the order *Chilognatha*, and chiefly of the families *Julidæ* (see *JULUS*) and *Polydesmidæ*. In the latter family, the feet are arranged in numerous groups along both sides; otherwise, they much resemble the *Julidæ*. The largest species are found in warm climates, and some of them are brightly colored; but small species of both families are common in Britain; and some of them, as *Polydesmus complanatus*—which is lilac-colored, flattened, and from a quarter to half an inch in length—are very destructive to the roots of plants. Doubt has been expressed if they attack roots perfectly healthy; but, at all events, they take advantage of incipient decay, and greatly extend and accelerate it. The application of salt, lime, nitrate of soda, &c., has been often recommended as a preventive of their ravages.—The name **PILL M.** is often given to those shorter *Chilognatha*, of the family *Glomeridæ*, which, when disturbed, roll themselves up into an almost globular form, like the crustacean called

armadillo. *Glomeris marginata* is common in Britain, under stones and among mosses. Some of the tropical species are large and finely colored.

MILLER, Hugh, a distinguished geologist, was born in Cromarty, in the north of Scotland, October 10, 1802. He was descended from a family of sailors, and lost his own father by a storm at sea when he was only five years of age. In consequence of this misfortune, he was brought up chiefly under the care of two of his mother's uncles, one of whom ("Uncle Sandy") imbued him with a taste for natural, and the other ("Uncle James") for traditional history. He acquired a good knowledge of English at the Cromarty grammar-school. Before his 11th year, he had read those glorious romances of childhood, "Jack the Giant-killer," "Jack and the Bean-stalk," "Sinbad the Sailor," "The Yellow Dwarf," and "Aladdin and the Wonderful Lamp," besides several other works of higher literary pretensions. As he grew older, he became extremely fond of the great English poets and prose writers. From his 17th to his 34th year, he worked as a common stone-mason, devoting his leisure hours to independent researches in natural history, and to the extension of his literary knowledge. In 1829, he published a volume, entitled "Poems written in the Leisure Hours of a Journeyman Mason," which was followed, a few years afterwards, by "Scenes and Legends of the North of Scotland." His attention was soon drawn to the ecclesiastical controversies which were agitating Scotland, and his famous "Letter to Lord Brougham" on the "Auchterarder Case," brought him prominently into notice. In 1840, he went to Edinburgh as editor of the "Witness," a newspaper started in the interest of the Non-Intrusion party in the Church of Scotland; and, in the course of the same year, published in its columns a series of geological articles, which were afterwards collected under the title of "The Old Red Sandstone, or New Walks in an Old Field." These articles were very remarkable, both in a scientific and literary point of view. They contained a minute account of the author's discovery of fossils in a formation believed, until then, to be destitute of them, and written in a style which was a harmonious combination of strength, beauty, and polish. At the meeting of the British Association in the same year (1840), he was warmly praised by Murchison and Buckland, and, in fact, his discoveries were the principal topic of discussion among the savans. His editorial labors during the heat of the Disruption struggle were immense, and so seriously injured his health, that for some time he had to give up all literary activity. About 1846, he resumed his pen, and became the most vigorous and eloquent writer in the service of the newly-constituted Free Church. After ten years of hard, earnest, fagging toil, his brain gave way, and, in a moment of aberration, he put an end to his own existence, at Portobello, near Edinburgh, on the night of the 23d, or morning of the 24th December 1866. M.'s principal works, besides those already mentioned, are: "First Impressions of England and its People;" "Footprints of the Creator, or the Asterolepis of Stromness," designed as a reply to the "Vestiges of the Natural History of Creation;" "My Schools and Schoolmasters, or the Story of my Education;" and "Testimony of the Rocks," the last of which is an attempt to reconcile the geology of the Pentateuch with the geology of nature, by the hypothesis, that the days mentioned in the first chapter of Genesis do not represent the actual duration of the successive periods of creation, but only the time occupied by God in unrolling a panoramic vision of these periods before the eyes of Moses.

M.'s services to science have undoubtedly been great, but he is even more distinguished as a man than as a savant. Honest, high-minded, earnest, and hugely industrious, a true Scot, a hearty but not a sour Presbyterian (for he loved Burns as much as he revered Knox), there are few of whom Scotland has better reason to be proud than "the stone-mason of Cromarty." Besides his autobiography quoted above, see Life by Peter Bayne (3 vols. 1871).

MILLER'S THUMB. See BULLHEAD.

MILLET, a grain, of which there are several kinds, the produce of species of *Panicum*, *Setaria*, and allied genera. The genus *Panicum* contains many species, natives of tropical and warm temperate countries, and some of which, as *Guinea Grass* (q. v.), are amongst the largest fodder grasses. The flowers are in spikes, racemes, or panicles; the glumes very unequal, one of them often very minute; each spikelet containing two florets, one of which is often barren. The genus

*Setaria* has a spike-like panicle, with two or more bristles under the glumes of each spikelet.—COMMON M. (*Panicum miliaceum*) is an annual grass, three or four feet high, remarkably covered with long hairs, which stand out at right angles. It has a much-branched nodding panicle; the spikelets are oval, and contain only one seed. It is a native of the East Indies, but is extensively cultivated in the warmer parts of Europe and other quarters of the world. It succeeds only in those climates in which wine can be produced. It is called *Warree*, *Cheena*, and *Kadi-kane* in India. The grain, which is very nutritious, is only about one-eighth of an inch in length. It is used in the form of groats, or in flour mixed with wheat-flour, which makes a good kind of bread; but bread made of M. alone is brittle and full of cracks. Poultry are extremely fond of millet. The straw is used for feeding cattle.—Other species, *P. miliare*, *P. frumentaceum*, and *P. pilosum*, are cultivated in different parts of India, chiefly on light and rather dry soils, yielding very abundant crops.—GERMAN M., or *MOHAR* (*Setaria Germanica*), and ITALIAN M. (*S. Italica*), regarded by many as varieties of one species, and probably originally from the East, although now naturalised in the south of Europe, are cultivated in many of the warmer parts of Europe, in India, and other countries. Italian M. is three or four feet in height; German M. much dwarfier, and its spike comparatively short, compact, and erect; and less valuable as a corn-plant. The grains of both are very small, only about half as long as that of Common M.; but they are extremely prolific, one root producing many stalks, and one spike of Italian M. often yielding two ounces of grain. The produce is estimated as five times that of wheat. Italian M. is called *Koongoonie*, *Kala-kang-nnee*, and *Kora-kang* in India. The grain of these millets is imported into Britain for feeding cage-birds, and for use as a light and pleasant article of food, although for this purpose it is little used in Britain, whilst it is very extensively used in soups, &c., in the south of Europe. It does not make good bread. To the same tribe of grasses belong the genera *Paspalum*, *Pennisetum*, *Penicillaria*, *Digitaria*, and *Milium*—species of which are cultivated in different parts of the world for their grain. *Paspalum exile* is the *Fundi* (q. v.) of Africa; and *P. scrobiculatum* is the *Koda* of India, where it is cultivated chiefly on poor soils. *Penicillaria spicata*, or *Pennisetum typhoides*, is very extensively cultivated in Africa, and to a considerable extent in India. Its cultivation has been introduced into the south of Europe. It succeeds best on light soils. Its Indian name is *Bajree*. It often receives the names EGYPTIAN M. and GUINEA CORN. It has a somewhat spiked cylindrical panicle.—*Pennisetum distichum* abounds in Central Africa, on the southern borders of the Great Desert, where it is called *Uzak*, and is described by Barth as causing much inconvenience to the traveller, the little bristles which are attached to its seeds making them stick like burs to the clothes; they also pierce the skin, and cause sores, so that it is necessary to be provided with small pinners for their extraction, and none even of the wild roving natives is ever without such an instrument. But its seed is a common and pleasant article of food, in some places the principal food of the people, and a pleasant beverage is made from it.—*Digitaria sanguinalis* is called *POLISH M.*, being cultivated in cottage-gardens in Poland, where the grain is used like rice. It is a common grass in many parts of Europe, although very rare in Britain. The spikes in this genus are compound, and from their appearance give it the names *Digitaria* and *Finger-grass*.—The M. GRASS (*Milium effusum*) of Britain, occasionally found in shady woods, is a very beautiful grass, three or four feet high, with a spreading pale panicle of small flowers; and has been much recommended for cultivation as a forage grass, and for the sake of its very abundant small seeds, an excellent food for game. Another species of the same genus (*M. nigricans*) is the *Maize de Guinea* of Peru, where its seeds, after being dried by heat, are converted into a very white flour, a pleasant article of food; and a beverage called *ullpu* is made from them.—The name INDIAN M. is sometimes given to *Durra* (q. v.), but it belongs to a different tribe of grasses from the true millets.

MILLRIND, or Fer de Moulin, in Heraldry, a charge meant to represent a mill-rion, originally a mere variety in designating the cross moline, but accounted a distinct charge by some heralds.

MILMAN, Henry Hart, D.D., an English poet and ecclesiastical historian, was the youngest son of Sir Francis Milman, physician to George III., and was born in London, 10th February 1791. He was educated at Eton, and afterwards at Brasenose

College, Oxford, where he took the degree of M.A., obtained the Newdegate Prize in 1812, published "*Fazio, a Tragedy*" (which was successfully brought upon the stage at Covent Garden), in 1815; took orders in 1817, and, shortly after, was appointed vicar of St Mary's, Reading. In the following year appeared his "*Samor,*" "*Lord of the Bright City,*" "*an Heroic Poem,*" which was followed in 1820 by the "*Fall of Jerusalem,*" a beautiful dramatic poem, with some fine sacred lyrics interspersed. In 1821, M. was chosen Professor of Poetry at Oxford, and published three other poems in the course of the same year—"The Martyr of Autloch," "*Belshazzar,*" and "*Anne Boleyn.*" His "*Sermons at the Bampton Lecture*" appeared in 1827, and his "*History of the Jews*" (3 vols.) in 1829. The last of these works did not bear the author's name; it was written in so liberal and tolerant a spirit, that ecclesiastics of the stricter sort could hardly fail to be offended. Its weak point was a want of adequate learning, especially in the department of biblical criticism. A new edition, greatly improved, and more critical, yet still far from being very accurate, or built on solid foundations, with an interesting preface, was published in 1863. In 1840 appeared a collected edition of his "*Poetical Works,*" containing some other pieces besides those already mentioned. The same year witnessed the publication of his "*History of Christianity from the Birth of Christ to the Abolition of Paganism in the Roman Empire*" (3 vols.). In 1849 he was made Dean of St Paul's; and in 1854 published his master-piece, "*History of Latin Christianity,*" including that of the Popes to the Pontificate of Nicholas V." (3 vols.). It is a work of great learning, liberality, and chastened eloquence; it displays a broad grasp of human nature in its religious workings; besides a philosophic and poetical sympathy with the different men and opinions which it reviews. The work secured for its author a position in the first rank of English historians. M. edited Gibbon, and contributed extensively to the "*Quarterly Review.*" He died in 1868. A posthumous work contains his "*Essays on St Paul,*" "*Savonarola,*" "*Erasmus, &c.*"

MILNE-EDWARDS, Henri, the most eminent living representative of the French school of natural history, was born at Bruges in 1800. His father was an Englishman. M. studied medicine at Paris, where he took his degree of M.D. in 1823, but abandoned medicine to devote himself to natural history. He was first appointed Professor of Natural History in connection with the Lycée Henri Quatre, and afterwards to the Museum and the Faculté des Sciences, of which he is now President. In 1838 he was elected a member of the Academy of Sciences (section of Anatomy and Zoology); and in 1854 was chosen a member of the Académie de Médecine. He is also a member of many other societies, French and foreign, and a commander of the Legion of Honor. M. is distinguished for his extensive knowledge of comparative anatomy and physiology, as well as of zoology. Passing over some of his early works, which, though valuable, are thrown into the shade by his later ones, we come to his "*Monograph on the Crustacea*" (1837-1841), which is universally regarded as of pre-eminent merit, not only for its richness of detail, but also for the value of the general doctrines relating to homologies, development, geographical distribution, and other points of the highest physiological interest. In 1840, an improved edition of his "*Elements of Zoology,*" a work in 4 vols., and containing 600 illustrations, began to appear. In 1841 he published his researches on the Compound Acidian Mollusca, which have led to an entirely fresh appreciation of some of the most important points in the history of that group, such as, that *propagation by gemmation*, which had been previously supposed to be a zoophytic character, is equally true of the lower mollusca. In other departments of science, M. has been equally successful; but it is to the invertebrate animals that his chief attention has been given, and in each of the three Cuvierian sub-kingsdoms, *Articulata*, *Mollusca*, and *Radiata*, his researches have been so important, that what he has accomplished for either alone would suffice to establish for him a high scientific reputation. In 1856 M. obtained the Copley Medal of the Royal Society of London. His later works include "*Lectures on Physiology,*" and on the "*Comparative Anatomy of Men and Animals*" (1855-1857); "*History of the Mammalia*" (1872, & seq.); &c.

MILNER, Joseph, an ecclesiastical historian who once occupied a respectable place in literature, was born near the town of Leeds, in Yorkshire, January 2, 1744. He studied at Catharine Hall, Cambridge, where he took the degree of B.A. in 1766, and afterwards became head-master of the grammar-school

at Hull. In this capacity, his success was very great. Shortly after, he was appointed lecturer in the principal church of the town, and in 1797, vicar of Holy Trinity Church. He died November 15th of the same year. M.'s principal work is his "History of the Church of Christ," of which he lived to complete 8 vols., reaching to the 13th c. (1794); a fourth volume, reaching to the 16th c., was edited from his MSS. by his brother, DR. ISAAC MILNES, Dean of Carlisle, who also published a complete edition of his brother's works in 8 vols., 1810. The principles on which "The History of the Church of Christ" is written are of the narrowest kind; the scholarship is poor, the literary merit still poorer, and the critical insight poorest of all. It deserves mention only for the estimation in which it was formerly held, at a time when the English Church seemed sunk in ignorance and stupor.

MILNES, Richard Monckton, Baron Houghton, English poet and politician, descended from an old Yorkshire family, was born in 1802, and educated at Trinity College, Cambridge. He entered parliament as M.P. for Pontefract in 1837, and continued to represent that borough until the close of the parliamentary session of 1863, when he was called to the Upper House by the title of Baron Houghton. In the House of Commons he began life as a Conservative, but afterwards allied himself to the Liberal party, and was a faithful follower of Lord Palmerston, when his foreign policy and high-handed dealings at the Foreign Office led to the temporary estrangement of that statesman from the Whigs. M. has distinguished himself, however, rather by his philanthropic labors, and his speeches on behalf of the Italians, Poles, and other oppressed nations, than by his devotion to party politics. He has been the advocate of public education and religious equality. He carried, in 1846, a bill for establishing Reformatories, and has taken a great interest in the reform of the criminal classes. M. has also cultivated the muses with grace and success. He has travelled much in oriental countries, and is the author of "Memorials of a Tour in Greece," and also of poems called "Palm Leaves," in which a poetical halo is thrown around the manners and domestic institutions of the East. His "Poems of Many Years," and "Poems, Historical and Legendary," contain many simple and elegant effusions. In 1849, he edited the "Life, Letters, and Literary Remains of John Keats." He has also written "Thoughts on Purity of Election;" "Monographs, Personal and Social" (1873-6); &c. His "Collected Poetical Works" appeared in 1876.

MILO, of Oroton, in Magna Græcia (q. v.), an athlete famous for his great strength, who lived, according to Herodotus, in the time of Darius Hystaspes, about 530 B.C. Among other displays of his strength, he is said to have on one occasion carried a live ox upon his shoulders through the stadium of Olympia, and afterwards to have eaten the whole of it in one day; and on another (reversing the story of the Hebrew Samson), to have upheld the pillars of a house in which Pythagoras and his scholars were assembled, so as to give them time to make their escape when the house was falling. He is said to have lost his life through too great confidence in his own strength, when he was getting old, in attempting to split up a tree, which closed upon his hands, and held him fast until he was devoured by wolves.

MILREE, Milrel, or Milren, a Portuguese silver coin and money of account, contains 1000 rees, and is valued at 4s. 8½d. sterling. The coin is commonly known in Portugal as the *coroa*, or "crown," and is (since 24th April 1835) the unit of the money-system in that country. It is used in Brazil. The half-coron, or half-milrel, of 500 rees, is also used in both countries. The name "milrel" was used in Portuguese accounts long before any coin representing its value existed.

MILTIADES, a celebrated Athenian general, "tyrant of the Chersonese," yet, as Byron sings, "freedom's best and bravest friend." Forced by Darius to flee from his dominions, he took refuge at Athens, and on the second Persian invasion of Greece, his military talents being of a high order, he was chosen one of the ten generals. He particularly distinguished himself by the great victory which he gained at Marathon (q. v.) with a small body of Athenians and 1000 Plataeans (29th September, 490 B.C.) over the Persian host, under Datis and Ariaphernes. By this victory, the Greeks were emboldened for the heroic struggle which they made in defence of their country and their liberty. M. being intrusted with the command of an armament for the purpose of retaliating on the Persians, made an attack on the

island of Paros in order to gratify a private enmity; but failing in the attempt, he was, on his return to Athens, condemned to pay a heavy fine as an indemnification for the expenses of the expedition. Being unable to do this, he was thrown into prison, where he died of a wound received at Paros. The fine was exacted after his death from his son Cimou (q. v.).

MILTON, John, an English poet, was born in Bread Street, London, on the 9th December 1608. His father was of an ancient Catholic family, but was disinherited on becoming Protestant. He followed the occupation of a scrivener, by which, according to Aubrey, "he got a plentiful estate," and was a man of great musical accomplishment, being the composer, among other things, of the two well-known psalm-tunes "Norwich" and "York." From him his son derived his matchless ear, and that strict integrity of character for which he is as famous as for his verse.

M. was carefully nurtured and educated. He was first placed under the care of a private tutor named Young, a Scotchman by birth and education; and at the age of twelve, was sent to St Paul's School, London, and afterwards to Christ's College, Cambridge. According to the University Register, he was admitted 12th February 1624-1625. He took his degree of M.A.; and having relinquished the idea of following divinity or law, he left Cambridge in 1632, and went to live at his father's house at Horton, in Buckinghamshire. There, in serenity of mind and passion, he lived five years, reading the Greek and Latin poets, and composing "Comus," "Lycidas," "Arcades," "L'Allegro," and "Il Penseroso." On the death of his mother in 1637, he went abroad, visiting the chief Italian cities, and making the acquaintance of Grotius and Galileo. While travelling, being made aware that clouds were gathering in the political atmosphere at home, he returned in 1639, and engaged himself with the tuition of his nephews—on which portion of M.'s life, Dr Johnson could not help looking with "some degree of merriment." In 1641, he engaged in the controversies of the times, and in the course of that and the following year, he issued the treatises "Of Reformation," "The Reason of Church Government urged against Prelacy," "Prelatical Episcopacy," and "An Apology for Smectonimus." In 1643, he married rather suddenly Mary, daughter of Richard Powell, an Oxfordshire royalist, but the union did not at first prove happy. His wife, who had been accustomed to "dance with the king's officers at home," found her husband's society too austere and philosophic for her gay tastes. After the severe honeymoon was over, she obtained permission to visit her relatives till Michaelmas; but when Michaelmas came, she refused to return. Stern and proud, M. repudiated her at once; and the matrimonial disagreement made the world the richer by four "Treatises on Divorce." A reconciliation, however, took place, which, we have no reason to doubt, was both genuine and permanent. Mary Powell died in 1652-1653, leaving him three daughters, Ann, Mary, and Deborah, of whose undutifulness and ingratitude we have latterly many complaints. In 1644 he produced his "Tractate on Education" and his "Areopagitica"—a flame of eloquence at which one may warm one's hands yet. After the execution of Charles, he was appointed Latin secretary to the Council of State, with a salary of £290. In his new position, his pen was as terrible as Cromwell's sword. In "Elkonoklastes," he made a savage but effective reply to the famous "Elkon Basilike;" and in his "Pro Populo Anglicano Defensio" he assailed his opponent, Claude de Saumaire, better known as *Salmasius*, with such a storm of eloquence and abuse, that the latter, who died at Spa in 1653, is believed to have lost his life through chagrin. M. at least flattered himself with having "killed his man." His second wife, whom he married 12th November 1656, was a daughter of Captain Woodcock of Hackney. She died in childbirth in February 1653, and her husband has enshrined her memory in an exquisitely pure and tender sonnet.

Unceasing study had affected his eyesight, and about 1654, M. became totally blind. After the Restoration, he retired from affairs; he was obnoxious to the reigning power, and it is said that he was once in custody of the sergeant-at-arms. On the Publication of the Act of Oblivion, he married his third wife, Elizabeth Minshull, and shortly after removed to a house in Artillery Walk, when he was busy with "Paradise Lost." This great poem was originally planned as a mystery, then some idea of treating it as a drama haunted the author's mind; finally, however, he resolved to write an epic poem on the Fall of Man. The poem was published in 1667. He received five pounds from his publisher, and a promise of other five

Milwaukee  
Mina

92

pounds when 1300 copies should have been sold. In 1670, he published his "History of England." Next year, he printed "Paradise Regained and Samson Agonistes." He died on Sunday, the 8th November 1674, and was buried next his father, in the chancel of St Giles, at Cripplegate. He left property to the value of £1500.

M. was, above all English poets, stately and grandiose. He arrived early at the knowledge of his powers, and did not scruple, in one of his prose tracts, to inform his readers that he purposed to write a poem which would be considered one of the glories of his country. Drawn away for a time by the heats of controversy and by official tasks, he never forgot his pledge, and redeemed it at last in old age, blindness, and neglect. In comparison, other poets are like sailing-ships, at the mercy of the winds of Passion and Circumstance; he resembled the ocean-steamer, which, by dint of internal energy, can pierce right through the hurricane. Never, perhaps, was a mind more richly furnished. His careless "largess" is greater than the fortunes of other men. His "Comus" is the very morning-light of poetry; while in his great epic there is a massiveness of thought, a sublimity of imagery, a pomp of sound—as of rolling organs and the outbursting of cathedral choirs—which can be found nowhere else. His great passages echo in the mind as if loth to die. Of all great writers, he is perhaps the one for whom we are conscious of the least personal affection, and this arises from a certain hauteur and severity which awes—which repels some natures; yet he infects his reader with his own seriousness. A most serviceable edition of his poetical works is that by Professor Masson, 3 vols. 1874. See also Masson's "Life and Times of M." (5 vols. 1858—79).

MILWAU'KEE, a city of Wisconsin, United States of America, on the western shore of Lake Michigan, at the mouth of Milwaukee River or Creek, which forms its harbor. The town, beautifully built with light yellow bricks, crowns a high bluff on the lake, and contains county buildings, custom-house, and post-office, 69 churches, public schools, female college, banks, insurance companies, asylums, hospital, and many daily and weekly papers. Several railways connect the city with a country of great fertility. In extent of marine commerce, M. ranks fourth among the cities of the union; and it has great advantages as a manufacturing centre. The grain received at M. in 1878 amounted to 83,963,315 bushels. Pop. (1890) 45,264; (1870) 71,440; (1890) 115,587.

MIMĀNSĀ (from the Sanscrit *mān*, to investigate; hence, literally, investigation) is the collective name of two of the six divisions of orthodox Hindu philosophy. See SANSCRIT LITERATURE. It is distinguished as *Pāra* and *Uttara-mīmāṃsā*, the latter being more commonly called *Vedānta* (q. v.), while the former is briefly styled *Mīmāṃsā*. Though the M. is ranked, by all native writers, with the five other philosophical systems, the term philosophy—as understood in a European sense—can scarcely be applied to it; for the M. is neither concerned with the nature of the absolute or of the human mind, nor with the various categories of existence in general—topics dealt with more or less by the other five philosophies; its object is merely to lay down a correct interpretation of such Vedic passages as refer to the Brāhmaṇic ritual, to solve doubts wherever they may exist on matters concerning sacrificial acts, and to reconcile discrepancies—according to the M., always apparent only—of Vedic texts. The foundation of this system is therefore preceded by a codification of the three principal Vedas—the R'ik, Black-Yajus, and Sāman—and by the existence of schools and theories which, by their different interpretations of the Vedic rites, had begun to endanger, or, in reality, had endangered a correct, or at least authoritative understanding of the Vedic texts. It is the method, however, adopted by the M. which imparted to it a higher character than that of a mere commentary, and allowed it to be looked upon as a philosophy; for, in the first place, the topics explained by this system do not follow the order in which they occur in the Vedic writings, especially in the Brāhmaṇa portion of the Vedas (q. v.); they are arranged according to certain categories, such as authoritativeness, indirect precept, concurrent efficacy, co-ordinate effect, &c.; and secondly, each topic or case is discussed according to a regular scheme, which comprises the proposition of the subject-matter, the doubt or question arising upon it, the *primā-faciē* or wrong argument applied to it, the correct argument in refutation of the latter, and the conclusion devolving from it. Some subjects treated of in the M., incidentally as it were, and merely for the sake of argument, belong likewise more to the sphere of phi-

losophic thought than to that of commentatorial criticism, such, for instance, as the association of articulate sound with sense, the similarity of words in different languages, the inspiration or eternity of the Veda, the invisible or spiritual operation of pious acts, &c. The reputed founder of this system is Jainini—of unknown date—who taught it in twelve books, each subdivided into four chapters, except the third, sixth, and tenth books, which contain eight chapters each; the chapters, again, are divided into sections, generally comprising several Sûtras or aphorisms, but sometimes only one. The extant commentary on this obscure work is the "Bhāṣhya" of 'Sābara-swāmin, which was critically annotated by the great M. authority, Kumārila-swāmin. Out of these works, which, in their turn, quote several others, apparently lost, has arisen a great number of other writings, explaining and elucidating their predecessors. The best compendium, amongst those modern works, is the "Jainini-nyāya-mālā-vistara," by the celebrated Mādhavāchārya (q. v.).

**MIMES**, the name given by the ancients to certain dramatic performances, in which, with little attempt at art, scenes of actual life were represented, sometimes in improvised dialogue. The Greek mimes appear to have been invented by the Greeks of Sicily and Southern Italy. They were a favorite amusement of convivial parties, the guests themselves being generally the performers. Sophron of Syracuse, about 420 B.C., composed many in the Doric dialect, which were much admired, and which Plato was accustomed to read.—The Roman mimes were not borrowed from the Greek, but were of native Italic growth. They were not only far ruder and coarser, but in some respects they were essentially different—the dialogue occupying a smaller place, and mere gesture and mimicry predominating. The humor and satire, however, were often genuine, though rough, and even indecent, and they were greatly relished by all classes; even the patrician Sulla was found of them.

**MIMOSEÆ**, a sub-order of *Leguminosæ*, one of the largest natural orders of exogenous plants; distinguished by regular flowers and petals valvate in bud. About 1000 species are known, all natives of warm climates, a few only extending beyond sub-tropical regions in the southern hemisphere. The genera *Acacia* (q. v.) and *Mimosa* are the best known. To the latter genus belong the Sensitive Plants (q. v.). Some of the larger species of M. are valuable timber trees. The *TALHA* (*Mimosa ferruginea*) is one of the most common trees of Central Africa. They are also trees of great beauty. Some species of the genus *Prosopis*, natives of the western parts of South America, are remarkable for the abundance of tannin in their pods.

**MIMULUS**, a genus of plants of the natural order *Scrophulariaceæ*, having a prismatic 5-toothed calyx, a somewhat bell-shaped corolla, of which the upper lip is bilid and the lower lip trifid, the lobes not very unequal, two long and two short stamens, and a stigma of two lamellæ, which close together upon irritation. The species are mostly herbaceous plants, natives of America. Some of them are very frequent in flower-gardens, and many fine varieties have resulted from cultivation. They sometimes receive the name of *Monkey-flower*. One species, *M. luteus*, a native of Peru and Chili, has become naturalised in many parts of Britain. The little yellow-flowered **MUSK PLANT**, now so common in gardens and on window-sills in Britain, is *M. moschatum*, a native of Oregon and other north-western parts of America.

**MINA**, or Mna, the name of a Greek weight and money denomination, derived from an oriental word *maneh*, signifying "weight." The mina contained 100 Drachmæ (q. v.), and was the sixtieth part of a talent; consequently, as a weight, it was equivalent to about  $1\frac{1}{4}$  of a pound avoirdupois, varying in different districts to the extent of one-third of a pound more or less, following the fluctuations of the talent itself. As a money of account, it preserved the same relation to the talent, and was worth £4, 1s. 3d. See **TALENT**.

**MINA BIRD** (*Bulabes Indicus* or *Gracula Indica*), a species of Grackle (q. v.), or of a nearly allied genus, a native of many parts of the East Indies, about the size of a common thrush, of a deep velvety black color, with a white mark on the base of the quill-feathers of the wings, yellow bill and feet, and two large bright yellow wattles at the back of the head. The bill is large, conical; the upper mandible a little curved, and sharp-pointed. The food of the M. B. consists of fruits and in-

Minaret  
Mineral

94

**secta.** It is very lively and intelligent, and possesses a power of imitating human speech, excelled by none of the parrots. It has sometimes been trained to repeat sentences of considerable length. It is therefore in great request, and is often brought to Europe.—Another and larger species is found in Sumatra and some of the other eastern islands, possessing the same power of articulation. It is highly prized by the Javanese.

**MI'NARET**, Minar, a tall turret, used in Saracenic architecture. It contains a staircase, and is divided into several stories, with balconies from which the priests summon the Mohammedans to prayer—bells not being permitted in their religion—and is terminated with a spire or ornamental finial. The minarets are amongst the most beautiful features of Mohammedan architecture, and are an invariable accompaniment of the Mosques (q. v.). In India, *Minars*, or pillars of victory, are frequently erected in connection with mosques; some of these are lofty and splendid monuments, that of Kootub, at old Delhi, being 48 feet 4 inches in diameter at base, and about 250 feet high. They are often built on a plan of a star-like form, and are divided into stories by projecting balconies, like the minarets.

**MINCH**, the channel which separates the island of Lewes from the counties of Cromarty and Ross, in the north-west of Scotland. Its shores are exceedingly irregular, and its average width is about 28 miles. The *Little Minch*, which separates the island of Skye from that of North Uist and the neighboring islands in the Outer Hebrides, is upwards of 15 miles in width.

**MI'NCIO** (anc. *Mincius*), a river of Northern Italy, a continuation of the Tyrol-ese stream, the Sarca, emerges from Lake Garda at Peschiera, and after a course of about 98 miles through the province of Mantua, which it separates from Verona, falls into the Po, 8 miles below the city of Mantua. The M. has constituted an important basis of operation during the wars between Italy and Austria.

**MIND.** Having adverted in various other articles—**EMOTION**, **INTELLECT**, **WILL**, &c.—to the chief component parts of our mental constitution, all that is necessary under the present head is to consider the definition or precise demarcation of mind as a whole. In this subject, we cannot resort to the common method of defining, which is to assign something more simple and fundamental than the thing to be defined; as when we define gravity to be an *attractive force*, the notions of force and attraction being supposed to be more intelligible than gravity. Mind can be resolved into nothing more fundamental than itself; and therefore our plan must be, to call attention to those individual facts or experiences that are pointed at by the name, and to circumscribe, in some way or other, the whole field of such experiences. For an example of mind, we should probably refer each person to his pleasures and pains, which are a class of things quite apart and peculiar; we should also indicate thoughts or ideas, as mental elements; also exercises of will or voluntary action. There is a sufficient community of nature in those various elements to cause them to be classed by themselves, under a common designation, namely, mind. If any one could be made aware of all the phenomena that have received this designation, he would of course know the meaning in the detail; but this is not enough. Mind being a general or comprehensive name, we ought to see distinctly the common character or attribute pervading all those particular phenomena; the recognition of this common character is the knowledge of mind in general, or the determination of its defining attribute. For the settling of this common attribute, we have another great resource, besides comparing the individual facts, that is, to determine the opposite, or contrast of mind. Now the usually assigned contrast is matter; but more precisely, it is extension, or the *extended*, including both inert matter and empty space. When we are conscious of anything as having the property of Extension, our consciousness is occupied with the object world, or something that is not mind. When we are feeling pleasure or pain, remembering, or willing, we are not conscious of anything extended; we are said to be in a state of subjective consciousness, or to be exhibiting a phenomenon of mind proper. Hence, philosophers are accustomed to speak of the *intended mind*, as distinguished from the outer or object world. In one sense, everything that we can take cognizance of is mind or self; we cannot by any possibility transcend our own mental sphere; whatever we know, is our own mind; hence the idealism of Berkeley, which seemed to annihilate the whole external universe. But

this large sense of mind is not what is usually meant, and whatever view we take of the reality of the external world, we must never merge the distinction between the consciousness of the Extended—which is also coupled with other truly object properties, as inertia, for matter—and the consciousness of the Inextended, as constituting our feelings and thoughts. This opposition is fundamental and ineradicable, and is expressed in language by a variety of designations; mind and not mind, subject and object, internal and external. The laws and phenomena of the Extended are set forth in the sciences of the external world—Mathematics, Mechanics, Chemistry, &c.; the laws of the Mind proper, or the Subject consciousness, are quite distinct in their nature, and are embodied in a separate science, called Mental Philosophy, Psychology, &c.

**MINDANA'O.** See PHILIPPINE ISLANDS.

**MINDEN**, a Prussian town, in the province of Westphalia, lies on the Weser, is a prosperous, closely built city, with a population of (1875) 17,098. It was till lately a fortress of the second class. M., which ranks as one of the oldest towns in Germany, has a stone bridge across the river, originally erected in 1618, and possesses several ancient churches, the most noteworthy of which are the present Roman Catholic church. Built in the second half of the 11th century, it was till 1811 an episcopal cathedral. A battle was fought near M. in 1759, in which the French were defeated by an army of Anglo-Hanoverian troops.

The Hanoverian town of M. or *Münden* is situated in the district of Hildesheim, within the province of Göttingen, and at the confluence of the Fulda and Werra. Pop. (1875) 5616. M. lies in one of the most picturesque and fruitful parts of Hanover. It has 3 breweries and manufactories of china, earthenware, sugar, tobacco, and linen, with a noted linen-market. There are alum-works and good coal-mines in the immediate neighborhood; and it has an extensive river transport-trade in millstones, corn, and timber. M. possesses several architectural remains, indicative of its former more prosperous condition.

**MINDSZENT**, a town of Hungary, in the county of Csongrad, near the left bank of the Theiss, and just below the mouth of the Saros, 19 miles north from Szegedin. Pop. (1869) 9414.

**MINE'O**, a town of the island of Sicily, in the province of Catania, 82 miles south-west of Messina. It is supposed to occupy the site of the ancient *Meneæ*, founded by Ducetius, 469 B.C. Pop. 9500.

**MINERAL CHAMELEON.** See MANGANESE.

**MINERAL KINGDOM**, the inorganic portion of nature. Under this term, however, are not included the inorganic products of organic beings, as sugar, resins, &c., although substances more remotely of vegetable or even animal origin are reckoned among minerals, as coal, fossils, &c. To the Mineral Kingdom belong liquid and gaseous, as well as solid substances; water, atmospheric air, &c., are included in it. All the chemical elements are found in the Mineral Kingdom, from which vegetable and animal organisms derive them; but many of the compounds which exist in nature belong entirely to the vegetable and animal kingdoms, and are produced by the wonderful chemistry of life.

**MINERAL RESINS.** See RESINS.

**MINERAL TALLOW**, or Hatchetine, a remarkable substance found in several places in Britain, Germany, Siberia, &c., soft and flexible, yellowish white, or yellow, resembling wax or tallow, often flaky like spermaceti, inodorous, melting at 115°–170° F., and composed of about 86 carbon and 14 hydrogen.

**MINERAL WATERS.** This term is usually applied to all spring waters which possess qualities in relation to the animal body different from those of ordinary water. Mineral waters have been used as remedial agents from a very early period. The oldest Greek physicians had great faith in their curative power, and the temples erected to *Æsculapius* were usually in close proximity to mineral springs; they had recourse to the sulphurous thermal springs of Tiberias (now Taberah), which are still used by patients from all parts of Syria in cases of painful tumor, rheumatism, gout, palsy, &c., and to the warm baths of Calirrhoe, near the Dead Sea, which are mentioned by Josephus as having been tried by Herod in his sickness. We are in-

debted to the Romans for the discovery not only of the mineral thermic springs in Italy, but of some of the most important in other parts of Europe, amongst which may be named Aix-la-Chapelle, Baden-Baden, Bath, Spa in Belgium, and many others; and Pliny, in his "Natural History," mentions a very large number of mineral springs in almost all parts of Europe.

The therapeutic action of mineral waters, or of spas, as they are frequently termed, depends chiefly upon their chemical composition and their temperature, although a variety of other circumstances, as situation, elevation, climate, geological formation, mean temperature, &c., have an important bearing upon the success of the treatment.

The best time for undergoing a course of mineral waters is, in the majority of cases, the months of June, July, August, and September. There are, however, exceptions depending upon climate; for example, at Gastein, celebrated for its thermal springs, the weather is changeable and stormy in June and July, but pleasant in May, August, and September. Early rising is usually advisable during a course of mineral waters, and, as a general rule, the water should be drunk before breakfast, at intervals of about a quarter of an hour between each tumbler, moderate exercise being taken in the intervals. In many cases, bathing is of even greater importance as a remedial agent than drinking. Baths are generally taken between breakfast and dinner; and should never be taken soon after a full meal. The time during which the patient should remain in the bath varies very much at different spas, and the directions of the local physician should be strictly attended to on this point. It is impossible to determine beforehand how long a course of mineral waters should be continued, as this entirely depends upon the symptoms observed during treatment. As a general rule, the treatment should not be protracted beyond the space of six weeks or two months, but on this point the patient must be solely guided by the physician resident at the spa. It cannot be too forcibly impressed upon the patient, that indulgence in the pleasures of the table, and excesses of any kind, frequently counteract the salutary effects of the waters, while perfect mental relaxation is an important auxiliary to the treatment. It will be seen from remarks on the nature of the cases likely to receive benefit from the various kinds of mineral waters, that spas are only suitable for patients suffering from chronic disorders.

No classification of mineral waters based upon their chemical composition can be strictly exact, because many springs are, as it were, intermediate between tolerably well characterised groups. The following classification, which is adopted by Dr Althaus, in his "Spas of Europe" (Lond. 1862), is perhaps the most convenient: 1. Alkaline Waters; 2. Bitter Waters; 3. Muriated Waters; 4. Earthy Waters; 5. Indifferent Thermal Waters; 6. Chalybeates; 7. Sulphureous Waters.

1. The Alkaline Waters are divisible into: (a) *Simple Alkaline Acidulous Waters*, of which the chief contents are carbonic acid and bicarbonate of soda. The most important spas of this class are the thermal springs of Vichy and the cold springs of Pachelingen, Gellman, and Billin. These waters are useful in certain forms of indigestion, in jaundice arising from catarrh of the hepatic ducts, in gall-stones, in renal calculi and gravel, in gout, in chronic catarrh of the respiratory organs, and in abdominal plethora. Vichy (q. v.) may be taken as the representative of this class of springs. (b) *Muriated Alkaline Acidulous Waters*, which differ from the preceding sub-group in additionally containing a considerable quantity of chloride of sodium. The most important spas of this kind are the thermal springs of Ems, and the cold springs of Selters, Luhatschowitz, and Salzbrunn. They are useful in chronic catarrhal affections of the bronchial tubes, the stomach, and the intestines, and the larynx; and the Ems waters possess a high reputation in certain chronic diseases of the womb and adjacent organs. (c) *Alkaline Saline Waters*, of which the chief contents are sulphate and bicarbonate of soda. The most frequented of these spas are the warm springs of Carlsbad and the cold springs of Marienbad. Patients suffering from abdominal plethora are those most frequently sent to these spas, which often prove of great service, if the stagnation of the blood is owing to habitual constipation, pressure from accumulated feces, or congestion of the liver, unconnected with diseases of the heart or lungs. These waters, especially those of Carlsbad, afford an excellent remedy for the habitual constipation which so frequently arises from sedentary occupations; the result being much more permanent than that produced by strong purgative waters.

2. The chief contents of the Bitter Waters are the sulphates of magnesia and soda; and the best known spas of this class are those of Pálma, Salschütz, Sedlitz, Friedrichshall, and Kissingen; although there are two English spas—namely, the bitter water of Cherry Rock, near Kingswood, in Gloucestershire, and the Purton Spa, near Swindon, in Wiltshire—which “are, by their chemical composition, admirably suited for the treatment of many cases of disease, and may perhaps even prove superior to the continental spas of this class.”—Althaus, *op. cit.* p. 360. These waters act both as purgatives and diuretics, and may therefore be used advantageously in the numerous cases in which it is advisable to excite the action both of the bowels and kidneys.

3. The Muriated Waters are divisible into: (a) *Simple Muriated Waters*, of which the chief contents are a moderate quantity of chloride of sodium or common salt. The chief spas of this class are Wiesbaden and Baden-Baden, which are hot; those of Soden (in Nassau), of Mondorf (near Luxembourg), and of Canstatt (near Stuttgart), which are tepid; and those of Kissingen, Homburg, and Cheltenham, which are cold. They are chiefly employed in cases of gout, rheumatism, scrofula, and abdominal plethora. (b) *Muriated Lithia Waters*, of which the chief contents are the chlorides of sodium and lithium. The discovery of lithia in some of the Baden-Baden springs is so recent that there is as yet no sufficient experience concerning their therapeutic action. In gout, they first aggravate the pain, but then give relief; and in periodic headache, they have been found serviceable. (c) *Brines*, whose chief contents are a large amount of chloride of sodium. Amongst the spas of this kind, those of Rehme, in Westphalia, and Nauheim, in Hesse, have the greatest reputation. They are mostly employed for bathing, and are often of much service in scrofula, anæmia, rheumatism, certain forms of paralysis, and catarrh of the mucous membranes. (d) *Iodo-bromated Muriated Waters*, in which, besides a moderate quantity of chloride of sodium, the iodides and bromides of sodium and magnesium are contained in an appreciable quantity. Kreuznach is the most celebrated of the spas of this class. Its waters are used both for drinking and bathing, and are of service in scrofulous infiltrations of the glands, in scrofulous ulcers, in chronic inflammation of the uterus and ovaries, &c. The waters of Hall, in Austria Proper, are also of this class, and have a high reputation in cases of brouchocele or goitre.

4. *Earthy Waters*, of which the chief contents are sulphate and carbonate of lime. The most important waters of this class occur at Wildungen, Leuk, Bath, Lucca, and Pisa. The Wildungen water, which is exported in large quantities, is, according to Dr Althaus, “a capital diuretic, and not only promotes the elimination of gravel and renal calculi, but by its tonic action on the mucous membrane of the urinary passages, serves to prevent the formation of fresh concretions. It is also much used for chronic catarrh of the bladder, neuralgia of the urethra and neck of the bladder, dysuria, and incontinence of urine.” The baths of Leuk, in which many patients remain nine hours daily (viz., from 4 A.M. to 10 A.M., and from 2 P.M. to 5 P.M.), until an eruption appears, are chiefly used in chronic skin diseases. The waters of Bath, Pisa, and Lucca, which are thermal, are useful in chronic skin diseases, scrofula, gout, rheumatism, &c.

5. *Indifferent Thermal Waters*, which usually contain a small amount of saline constituents. Of the spas of this class, the most important are Gastein (95° to 118°), Toplitz (120°), Wildbad (96°), Warmbrunn (100°), Clifton (86°), and Buxton (82°). Their most striking effects are to stimulate the skin and excite the nervous system. “They are especially used in chronic rheumatism and atonic gout; in diseases of the skin, such as prurigo, psoriasis, lichen; in neuralgia and paralysis due to rheumatic and gouty exudations, to parturition, or to severe diseases, such as typhoid fever and diphtheria; in hysteria; and in general weakness and marasmus.”—Althaus, *op. cit.* p. 421.

6. *Chalybeate Waters*, which are divisible into: (a) *Simple Acidulous Chalybeates*, whose chief contents are carbonic acid and bicarbonate of protoxide of iron; and (b) *Saline Acidulous Chalybeates*, whose chief contents are sulphate of soda and bicarbonate of protoxide of iron. These waters are considered in a special article. See CHALYBEATE WATERS.

7. *Sulphurous Waters*, which contain sulphuretted hydrogen or metallic sulphides (sulphurets), or both. The most important sulphurous thermals are those of Aix-

Minera'logy  
Minerva

la-Chapelle, Baden (near Vienna), Barèges, Eaux-Chaudes, and Bagnères de Luchon; whilst amongst the cold sulphurous springs, those of Neundorf (in Hesse-Nassau) and Harrogate are of great importance. They are extensively used in chronic diseases of the skin, and are of service in many cases in which exudations require to be absorbed, as in swellings of the joints, in old gunshot wounds, and in chronic gout and rheumatism. In chronic laryngeal and bronchial catarrh, they frequently give relief, and in chronic poisoning by lead or mercury, they favor the elimination of the poison, although to a far less degree than iodide of potassium taken internally. The sulphurous waters are employed externally and internally, and mineral mud-baths are believed by many physicians to form a valuable auxiliary to this treatment.

For further information on this subject, the reader is referred to the work of Dr Althaus (of which free use has been made in this article), and to the "Dictionnaire Général des Eaux Minérales et d'hydrologie Médicale" of MM. Durand-Fardel, Le Bret, and Lefort.

**MINERA'LOGY** (Fr. *miner*, to dig, mine; Gael. *meinn*; Wel. *mun*, ore, mine), the science which treats of minerals. But it does not embrace all that relates to the mineral kingdom. *Simple minerals* alone, or homogeneous mineral substances, are regarded as the subjects of mineralogy; rocks formed by the aggregation of simple minerals, and their relations to each other, are the subjects of Geology (q. v.). This limitation of the term mineralogy is comparatively recent. Geology or geognosy was formerly included in it. The arrangement and description of simple minerals according to their external characters, has been called by Werner and others *Oryctognosy*, but the term has fortunately fallen into disuse. Nor is the study of mere external characters sufficient in mineralogy. The chemical composition of minerals equally demands attention. In the classification of minerals, some mineralogists, as Mohs and Jameson, have regarded only the external characters, and some, as Berzelius, only the chemical composition; but the results have been unsatisfactory, and the present tendency is in favor of a system which seeks to constitute natural groups by having regard to both.

Some minerals being of great use, and others highly valued for their beauty, have received much attention from the earliest ages. But the ancient naturalists describe few minerals. The first attempt at scientific mineralogy was by George Agricola in the 16th century. The systems of the Swedes Wallerius and Cronstedt, in the latter half of the 18th c., were the first worthy of the name. That of Werner followed, and was extensively adopted. The discoveries of Haüy in crystallography, and the progress of chemistry, gave mineralogy a new character; and then sprang up two schools of mineralogists, one resting chiefly on external characters, and the other on chemical composition.

The chemical classification of minerals is rendered difficult by the endless variety of combination and proportion in the elements of which they are composed, the presence of substances not essential to the mineral, and yet more or less affecting its characters, and the frequent impossibility of determining what is to be deemed essential, and what accidental. Chemical purity is almost never found in nature. Even the purest diamond, when burned, leaves some traces of ash; and the various colors of diamond, quartz, and other minerals are due to the presence of substances which are often in so small quantity as not to affect their crystalline forms or other physical properties. Again, some minerals of identical chemical composition differ in their crystallisation, so that an arrangement founded upon it would separate them too widely. There are also many minerals which are often found in an uncrystallised state, and others which are always so. In the arrangement of minerals into natural groups, their chemical composition, although not alone to be regarded, is of the first importance, so that the place of a new mineral in the system can never be determined without analysis; and in determining the nature of a mineral, chemical tests, such as the application of acids, are continually resorted to. It is also necessary to know its specific gravity, and how it is acted upon both by a moderate heat and by the blowpipe. An examination of the crystalline forms, with measurement of the angles of the crystals, is often sufficient to distinguish minerals which have otherwise much resemblance. The *cleavage* of crystals is also important, a readiness to split in planes parallel to certain of their faces only, by which the *primitive form* of the crys-

tal may be ascertained. Minerals not crystallised exhibit important varieties of structure, as *laminated, fibrous, granular, &c.* Certain peculiarities of form are also frequently characteristic of uncrystallised minerals, as *mamillary, botryoidal, &c.* Minerals exhibit, when broken, very different kinds of fracture, as *even, conchoidal, splintery, &c.* *Opaqueness, translucency, and transparency,* are more or less characteristic of different kinds; *electric and magnetic* properties demand attention; and very important characters are derived from *lustre*, which in some minerals is *metallic*, in others *semi-metallic*, in others *pearly, vitreous, &c.* *Color* is not generally of much importance, but in some minerals it is very characteristic. *Hardness and tenacity* are very important, and are of all various degrees. A few fluid, and even a few gaseous substances, are included in mineralogical systems. *Unguentous* and other peculiarities to be ascertained by the touch, are very characteristic of some minerals; peculiarities of *taste and smell* belong to others.

Minerology has very important relations with geology, which cannot be studied without regard to the mineral constituents of rocks. The mineral composition of soils greatly affects vegetation and agriculture. The economical uses of minerals are also very important and various. It is enough merely to allude to coal, lime, salt, and the metallic ores. Naphtha, petroleum, bitumen, asphalt, &c., are of well-known utility; and a high value has always been attached to gems and other ornamental stones.

**MINERVA**, the name of a Roman goddess, identified by the later Græcising Romans with the Greek *Athena*, whom she greatly resembled, though, like all the old Latin divinities, there was nothing anthropomorphic in what was told concerning her. Her name is thought to spring from the same root as *mens* (the mind), and *monere* (to warn or advise); and the ancient Latin scholar and critic, Varro, regarded her as the impersonation of divine thought—the plan of the material universe of which Jupiter was the creator, and Juno the representative. Hence all that goes on among men, all that constitutes the development of human destiny (which is but the expression of the divine idea or intention), is under her care. She is the patroness of arts and trades, and was invoked alike by poets, painters, teachers, physicians, and all kinds of craftsmen. She also guided heroes in war; and, in fact, every wise idea, every bold act, and every useful design, owes something to the high inspiration of this virgin goddess. Her oldest temple at Rome was that on the Capitol, but she had another on the Aventine. Her festival was held in March, and lasted five days, from the 19th to the 23d inclusive.

**ATHENE, or PALLAS ATHENE**, the Greek goddess corresponding, as we have said, to the Roman Minerva, was one of the few truly grand *ethical* divinities of Greek mythology. Different accounts are given of her origin and parentage, probably from the jumbling together of local legends; but the best known, and in ancient times, the most orthodox version of the myth represented her as the daughter of Zeus and Metis. Zeus, we are told, when he had attained supreme power after his victory over the Titans, chose for his first wife Metis (Wisdom); but being advised by both Uranus and Gæa (Heaven and Earth), he swallowed her, when she was pregnant with Athene. When the time came that Athene should have been born, Zeus felt great pains in his head, and caused Hephestus (Vulcan) to split it up with an axe, when the goddess sprang forth—fully armed, according to the later stories. Throwing aside the thick veil of anthropomorphism which conceals the significance of the myth, we may see in this account of Athene's parentage an effort to set forth a divine symbol of the combination of power and wisdom. Her father was the greatest, her mother the wisest of the gods. She is literally born of both, and so their qualities harmoniously blend in her. It is possible that the constant representation of her as a strictly maiden goddess, who had a *real*, and not a merely *prudish* antipathy to marriage, was meant to indicate that qualities like hers could not be mated, and that, because she was perfect, she was doomed to virginity. She was not, however, a cold unfeeling divinity; on the contrary, she warmly and actively interested herself in the affairs of both gods and men. She sat at the right hand of Zeus, assisting him with her counsels; she helped him in his wars, and conquered Pallas and Encelados in the battles of the giants. She was the patroness of agriculture, invented the plough and rake, introduced the olive into Africa, and (in harmony with her character as the personification of active wisdom) taught men

the use of almost all the implements of industry and art; and is said to have devised nearly all feminine employments. Philosophy, poetry, and oratory were also under her care. She was the protectress of the Athenian state, was believed to have instituted the court of justice on Mars' Hill (the Areiopagus). As a warlike divinity, she was thought to approve of those wars only which were undertaken for the public good, and conducted with prudence; and thus she was regarded as the protectress in battle of those heroes who were distinguished as well for their wisdom as their valor. In the Trojan wars, she favored the Greeks—who, in point of fact, were in the right. Her worship was universal in Greece, and representations of her in statues, busts, coins, reliefs, and vase-paintings were and are numerous. She is always dressed, generally in a Spartan tunic, with a cloak over it, and wears a helmet, beautifully adorned with figures of different animals, the ægis, the round Argolic shield, a lance, &c. Her countenance is beautiful, earnest, and thoughtful, and the whole figure majestic.

**MINERVINO**, a town of Southern Italy, in the province of Bari, called the *Balcony of Puglia*, from the extensive view it commands of several cities. It stands on a fine hill, and enjoys excellent air. Pop. 13,800.

**MINES**, in Law. In England and Ireland, the crown has the right to all mines of gold and silver; but where these metals are found in mines of tin, copper, iron, or other baser metal, then the crown has only the right to take the ore at a price fixed by statute. As a general rule, whoever is the owner of freehold land, has a right to all the mines underneath the surface, for his absolute ownership extends to the centre of the earth. When the land is given by will or otherwise to a tenant for life, while a third party has the reversion, then the tenant for life is held to be entitled not to open mines which have never before been opened, but to carry on such as have been opened, and are going mines. So in the case of a lease of lands for agricultural purposes, if nothing is said as to mines, the tenant is not entitled to open any mines, for that would be committing waste. It is not uncommon for one person to be owner of the surface of the land, and another to be owner of the mines beneath; or several persons may be owners of different kinds of mines lying above each other in the different strata. Many questions have been raised lately between railway companies and mine-owners as to their respective rights and liabilities. When a railway passes through a mining country, it is generally optional with the owner to sell to the company merely the surface of the lands, reserving to himself the mines beneath; and it is usually provided that, if ever the owner work his mines so near to the railway as to endanger its stability, the company must have notice of that fact, and then, if necessary, may purchase the mines immediately under the railway. But the courts have determined that even though the owner of the land reserve his right to minerals, he is nevertheless prevented, by common law, from working the mines immediately under the railway, so as to endanger the use of the railway. In these matters the law of Scotland does not at all differ, though, as to other points of the common law, some differences of no great importance occur. See Paterson's "Compendium of English and Scottish Law."

The practical working of mines and collieries in any part of Great Britain has been controlled by certain recent acts of parliament, with a view to insure the greater safety of the persons working them, and to prevent the employment of women and children. Thus, the owners of mines are prohibited, by the Mines Regulation Acts, 1872 (repealing prior acts), from employing any female or boy under 10 underground. Boys under 16 can only be so employed ten hours per day, and boys under 12 must attend school at certain times. No owner or worker of a mine or colliery is allowed to pay the wages of the men at any tavern, public-house, beer-shop, or place of entertainment, or any office or outhouse connected therewith. No person under 18 is to be employed at the entrance of any mine, to have charge of the steam-engine or windlass, or other machinery and tackle for letting down and bringing up the men. Inspectors are appointed by government for the express purpose of visiting mines, and seeing that the statutes are complied with. The statutes in question now apply not only to coal-mines and collieries, but to metalliferous mines of all kinds. Whenever an inspector, on examination, finds anything dangerous or defective in the mine, he is bound to give notice to the owner, so that it may be amended. In case of accidents occurring in the mine, caused by explosion,

and resulting in loss of life or bodily injury, the owner is bound, within twenty-four hours thereafter, to send notice to the Secretary of State, and to the district inspector of mines, specifying the probable cause of the accident.

**MINES**, Military, constitute at once one of the most important departments in military engineering, and a very formidable accessory both in the attack and defence of fortresses. A military mine consists of a gallery of greater or less length, run from some point of safety under an opposing work, or under an area over which an attacking force must pass, and terminating in a chamber which, being stored with gunpowder, can be exploded at the critical moment. Mines are of great use to the besiegers in the overthrow of ramparts and formation of a breach; the *countermines* of the besieged in undermining the glacis over which the assaulting column must charge, and blowing them into the air, or in destroying batteries erected for breaching, are equally serviceable. But far above the actual mischief wrought by the mine—often very great—is its moral influence on the troops, and especially on the assailants. The bravest soldiers, who advance without flinching to the very mouth of the cannon *which they see*, will hesitate to cross ground which they suppose to be undermined, and on which they may be dashed to destruction in a moment, without the power of averting the *unseen danger*. The first employment of mines was very ancient, and merely consisted in obtaining an entrance to the interior of towns by passing beneath the defences; but this soon fell into disuse, the chances of success being merely those of introducing a body of men before the besieged discovered the mine. The next use occurred during the middle ages, and was more destructive. The miners went no further than beneath the wall, then diverged to either side, and undermined the wall, say for about 100 feet. During the process, the wall was sustained by timber-props; and these being ultimately set on fire, the wall fell; and the besiegers, who had awaited the opportunity, rushed in at the breach. This use of mines of *attack* necessitated those of *defence*, which obtained in medieval times, and have ever since kept, the name of "*countermines*." The earliest subterranean defence consisted of a gallery surrounding the fort in advance of the foot of the wall, and termed an "envelope-gallery." From this the garrison would push forward small branches or tributary galleries, whence they could obtain warning of the approach of hostile miners, and by which they succeeded, at times, in overthrowing the battering-rams or towers of the besiegers.

Two centuries appear to have elapsed between the introduction of gunpowder into European warfare and its application to subterranean operations. The first instance of this occurred in 1508, at the siege of the Castello del' Uovo, in the Bay of Naples, which a French garrison had succeeded in holding for three years against the combined Spanish and Neapolitan forces. At length, a Spanish captain, Pedro Navarro, devised a gallery into the rock, which he stored with powder, whereof the explosion, hurling portions of the rock and many of the besieged into the sea, caused the immediate capture of the place. At once the use of mines of attack spread throughout Europe; and so irresistible were they soon considered, that it was not unusual for the besieger, after preparing his mine, to invite the besieged to inspect it, with the view of inducing the latter at once to surrender. Defence soon availed itself of the new power, and retaining the envelope-gallery as a base, ran small countermines in many directions, to ascertain by hearing the approach of the enemy's sappers—his work being audible, to a practised ear, at a horizontal distance of 60 feet. Small charges were then exploded, which, without creating surface disturbance, blew in the approaching gallery, and buried the sappers in its ruins. Thus commenced a system of subterranean warfare, requiring the greatest risk and courage, in which the operator was in constant danger of being suffocated. Of course, in such a system, the balance of advantage lay with the besieged, who had ample opportunities, before the siege commenced, of completing his ramifications in every direction, and, if desirable, of revetting them with masonry, which much diminished the chance of being blown in; while the assailant, no longer able to cross the glacis by an open zigzag trench, was compelled to engage in a most uncertain subterranean advance. The French engineer Belidor, in the 18th c., restored the advantage to the attack, by demonstrating that the explosion of a very large mass of powder in a mine which had not yet entered the labyrinth of defensive mines, effected the destruction of the latter for a great space round, clearing the way with certainty for the hostile advance. Although the primary purpose of a mine is the explosion of a

charge of powder, they are often used as a means of communication between different works, or between different parts of the same work, some being constructed of size sufficient to permit the passage of four men abreast, of horses, and of artillery.

It is, of course, impossible, in such a work as this, to give even an outline of the professional part of military mining; but the article would be incomplete without some allusion to the main principles.

Mines are either vertical—when they are called *shafts*—horizontal, or inclined, in either of which cases, they are “galleries,” the word “ascending” or “descending” being added, if there be inclination. The dimensions range from the “great gallery,” six feet six inches by seven feet, to the “small branch”—the last diminutive of the gallery—which has but two feet six inches height, with a breadth of two feet. The most frequent work is the “common gallery,” four feet six inches by three feet, which is considered the easiest for the miner.

The sapper's tools are numerous, but most in request are his shovel, pickaxe, and above all, his “push-pick;” he has besides a barrow, a small wagon, a lamp, and other accessories. As he advances, it is necessary to line his gallery, always at the top, and almost always at the sides. This he does either by frames—which resemble door-frames, and serve to retain horizontal planks or “sheeting” in position against the earth—or by cases somewhat resembling packing-cases, of little depth, which are used to form the sides and top. With cases, galleries are supposed to advance one foot and a half per hour; while with frames, the progress is barely more than half that amount.

When a mine is exploded, the circular opening on the surface is called the *crater*; the *line of least resistance* is the perpendicular from the charge to the surface; the half-diameter of the crater is its radius; and the *radius of explosion* is a line from the charge to the edge of the crater, on the hypotenuse of the triangle, the revolution of which would form the cone. When the diameter equals the line of least resistance, the crater is called a one-lined crater; when it doubles that line, a two-lined crater; and so on. The common mine for ordinary operations is the two-lined crater; and for this the charge of powder should—in ground of average weight and tenacity—be in pounds a number equal to one-tenth of the cube of the line of least resistance in feet; for example, at a depth of 18 feet, the charge should consist of 583 pounds. In sur-charged mines, or globes of compression, as introduced by Belidor, vastly greater charges are employed, and craters of six lines are sometimes produced. The rules, in these cases, for computing the charges vary exceedingly, according to different engineers, and in every case are very complicated. Previous to the explosion, the gallery is filled up behind the charge, or *tamped*, with earth, sand-bags, &c., to prevent the force of the powder wasting itself in the mine. This tamping must extend backwards for one and a half or twice the length of the line of least resistance. The mine is commonly fired by means of a powder-hose, composed of strong linen, enclosed in a wooden pipe laid carefully through the tamping, or by wires from a voltaic battery.

Modern engineers object to the envelope-gallery, as affording too good a base to the enemy, should he obtain possession of it; and either dispense with it altogether, or merely retain it in short sections. At suitable points among the mines, small magazines for tools and powder are formed; and at about every 80 yards, loop-holed doors of great strength are made, to stop the advance of an enemy, should he break into the galleries.

In the course of their excavations, hostile miners frequently meet, or approach within a few feet. It becomes, then, merely a question of time which shall destroy the other; shells, pistols, pikes, and petards, as well as small mines, being used with murderous effect.

Provision is made for pumping foul air out of mines; but such military works are in general badly ventilated.

**MINGHETTI**, Cavaliere Marco, a distinguished Italian writer and statesman, and for a time prime minister of Italy, was born at Bologna, on the 8th November 1818. He belonged to an opulent commercial family, and on the termination of his studies, entered on an extensive continental tour, with the object of closely investigating the political, social, and economical institutions of France, Germany, and more especially of Britain. On his return from travelling, he published his maiden

essay, inculcating the great commercial advantages of free trade, as existing in England, and espousing with warmth the economical views of Richard Cobden. In 1846, M. opened his political career by starting a journal of liberal tendencies, soon after the advent of Pius IX. to power; in 1847, he was elected member of the *Consulta delle Finanze*, and in 1848 became minister of public works. Having speedily lost faith in papal progression, M. withdrew from office, and joined the army of Charles Albert in Lombardy, where he was warmly received by the king, and appointed captain. After the battle of Goito, he was promoted major; and for his bravery in the engagement of Custoza, he received from the king the cross of the Knights of St Maurizio. On the conclusion of the war, M. resumed his study of political economy, and gained the confidence of Cavour, by whom he was consulted during the conferences of Paris. He subsequently became secretary for foreign affairs, and only resigned with Cavour on the peace of Villafranca. M. became minister of the interior in 1860, and premier in 1863. On leaving the ministry, he went as ambassador to London in 1868, and was subsequently, for a short time, minister of agriculture. In 1873 he became premier of a new ministry. His chief work is "*Della Economia pubblica e delle sue Attinenze con la morale, e Col diritto*" (1859).

**MINHO.** See **ENTRE DOURO E MINHO.**

**MINHO** (Span. *Miño*, anc. *Minius*), a river of Spain and Portugal, rises in the north-east of Galicia, in lat. about 43° 20' n., long. about 7° 15' w. Its course is south-west through the modern Spanish provinces of Lugo and Orense, after which, continuing its course, and forming the northern boundary of the Portuguese province of Minho, it falls into the Atlantic Ocean. Its length, exclusive of windings, is 180 miles, and it is navigable for small craft 28 miles above its mouth.

**MINIATURE-PAINTING**, or the painting of portraits on a small scale, originated in the practice of embellishing manuscript books. See **MANUSCRIPTS, ILLUMINATION OF**. As the initial letters were written with red lead (lat. *minium*), the art of illumination was expressed by the Low Lat. verb *miniare*, and the term *miniatura* was applied to the small pictures introduced. After the invention of printing and engraving, this delicate art entered on a new phase; copies, in small dimensions, of celebrated pictures came to be in considerable request, and, in particular, there arose such a demand for miniature portraits, that a miniature, in popular language, is held to signify "a very small portrait." Soon after their introduction, miniature-portraits were executed with very great skill in England. Holbein (b. 1498, d. 1564) painted exquisite miniatures, and having settled in London, his works had great influence in calling forth native talent. The works of Nicholas Hilliard (b. at Exeter 1547, d. 1619) are justly held in high estimation. Isaac Oliver (b. 1556, d. 1617) was employed by Queen Elizabeth and most of the distinguished characters of the time; his works are remarkable for careful and elaborate execution; and his son, Peter Oliver, achieved even a higher reputation. Thomas Flatman (b. 1633, d. 1688) painted good miniatures. Samuel Cooper (b. London 1609, d. 1672), who was, with his brother Alexander, a pupil of his uncle, Hoskins, an artist of reputation, carried miniature-painting to high excellence. Cromwell and Milton sat to him—he was employed by Charles II.—and obtained the highest patronage at the courts of France and in Holland. Till within these few years, miniature-painting continued to be successfully cultivated in Britain; but it has received a severe check since photography was invented, and most of the artists of the present time, who exercised their talents in this exquisite art, have left it for other branches of painting. As to technical details, the early artists painted on vellum, and used body-colors, that is, colors mixed with white or other opaque pigments, and this practice was continued till a comparatively late period, when thin leaves of ivory, fixed on card-board with gum, were substituted. Many of the old miniature-painters worked with oil-colors on small plates of copper or silver. After ivory was substituted for vellum, transparent colors were employed on faces, hands, and other delicate portions of the picture, the opaque colors being only used in draperies and the like; but during the present century, in which the art has been brought to the highest excellence, the practice has been to execute the entire work, with the exception of the high lights in white drapery, with transparent colors. In working, the general practice is to draw the picture very faintly and delicately with a sable hair-pencil, using a neutral tint composed of cobalt and burned

Minim  
Mining

104

sienna. The features are carefully made out in that way, and then the carnations, or flesh-tints, composed of pink, madder, and raw sienna, gradually introduced. The drapery and background should be freely washed in, and the whole work is then brought out by hatching, that is, by painting with lines or strokes, which the artist must accommodate to the forms, and which are diminished in size as the work progresses. Stippling, or dotting, was a method much employed, particularly in early times; but the latest masters of the art preferred hatching, and there are specimens by old masters, Perugino, for instance, executed in that manner.

MI'NIM, the name of one of the notes in modern music, the value of which is the half of a semibreve.

MINIMS (Lat. *Fratres Minimi*, Least Brethren), so called, in token of still greater humility, by contrast with the *Fratres Minores*, or Lesser Brethren of St Francis of Assisi (q. v.), an order of the Roman Catholic Church, founded by another St Francis, a native of Paula, a small town of Calabria, about the middle of the 15th century. Francis had, as a boy, entered the Franciscan order; but the austerities of that rule failed to satisfy his ardor, and on his return from a pilgrimage to Rome and Assisi, he founded, in 1453, an association of Hermits of St Francis, who first lived in separate cells, but eventually were united in the conventual life in 1474, and established in several places in Calabria and Sicily. Francis was also invited into France by Louis XI., and founded houses of his order at Amboise and at Plessis-les-Tours. In Spain, the brethren took the name of "Fathers of Victory," in memory of the recovery of Malaga from the Moors, which was ascribed to their prayers. It was not till very near the close of the life of Francis that he drew up the rule of his order. It is exceedingly austere, the brethren being debarred the use not only of meat, but of eggs, butter, cheese, and milk. Notwithstanding its severity, this institute attained considerable success; its houses, soon after the death of Francis (1502), numbering no fewer than 450. It has reckoned several distinguished scholars among its members; but in latter times, the order has fallen into decay, being now limited to a few houses in Italy, the chief of which is at Rome. The superiors of convents in this order are called by the curious name of *Corrector*, the general being styled *Generalis Corrector*. A corresponding order of females had its origin about the same time, but this order also has fallen into disuse.

MINING is a general term for the underground operations by which the various metals and other minerals are procured. It has been practised to some extent from the remotest times, as is proved by the reference to it in the 28th chapter of the book of Job. In its proper sense, the art was certainly known to the ancient Phœnicians and Egyptians, and also to the Greeks and Romans. Mining operations were carried on in Britain by the latter at the time of the Roman Conquest. After the Norman Conquest, Jews, and, at a later time, Germans were largely employed in our mines. The introduction of gunpowder as a blasting material in 1620, led the way to many improvements in mining; so also did the introduction of powerful engines for pumping water, about the beginning of the 18th c.

There are two principal methods of mining: one of which is adopted where the mineral occurs in veins or lodes, as copper and lead ore; and the other where the mineral occurs in more or less parallel beds, as coal. Mining in alluvial deposits is a third method, largely practised in the gold regions of California and Australia, and includes the novel process of "hydraulic mining."

In mines like those of Cornwall and Devonshire, where most of the copper and tin of Great Britain, and also some of the lead, are obtained, the ores occur in veins filling cracks or fissures in the rocks. Such veins are termed lodes, to distinguish them from veins of quartz and other non-metallic minerals. Lodes are very irregular in size, and in the directions they take, though they usually follow one general line.

Mineral veins sometimes extend for several miles through a country; but they expand and contract so much, and split up into so many branches, that it is perhaps uncertain whether the same lode has ever been traced for more than a mile. Veins seldom deviate more than 45 degrees from a perpendicular line, and descend to unknown depths. They penetrate alike stratified and unstratified rocks. Those veins which run east and west have been observed to be the most productive.

The adit, or day-level, is a long passage to which the water of the mine is pumped

up and conveyed away. Some adits are made to traverse several mines. The great adit which drains the mines of Glengap and Redruth, in Cornwall, is 30 miles long.

Levels are generally about ten fathoms (60 feet) apart. They are rarely perpendicular above each other, as they follow the inclination of the vein. In the section, the richer portions of the lode, termed "bunches," are shewn shaded; and where these have been removed, and their place filled with rubbish, angular fragments are represented. This is necessary to prevent the slides of workings from falling in. The bottom of the engine shaft is the lowest portion of the mine. It is called the *sump*, and is the place where the water from the various levels and workings collects, in order to be pumped up to the adit. The galleries and shafts in an extensive mine are very numerous, making it altogether a very complicated affair. The shafts, however, have all distinct names, and the levels are known by their depth in fathoms, so that particular places are as easily found as streets in a town. The underground workings of the Consolidated Mines, which are the largest in Cornwall, being a conjunction of four mines, are 55,000 fathoms, or 63 miles, in extent. In working out the lode between one level and another, the miner usually goes upwards, it being easier to throw down the ore than to raise it up. He works with the light of a candle, stuck with clay to the side of the mine. His tools are few—namely, a pick, a hammer, and some wedges where the vein is soft and friable; but it is generally hard enough to require blasting, in which case he uses a *borer* or *jumper*, and some smaller tools for cleaning and stemming the hole which is made. The ore is filled into wagons, and then drawn along the gallery to the shaft, to be raised to the surface in *kibbles*.

A vein may be 30 or 40 feet thick, and so poor in ore as not to be worth working; again, it may be only a few inches thick, and yet its richness may amply repay the labor of extracting it. Three or four feet may be taken as the average of several kinds of veins. In extensive mines, portions of the ore are here and there left in the lode, so as to furnish a steady supply when other parts are unproductive. These are called *eyes*, and when they are afterwards removed, the operation is termed *picking out the eyes of the mine*.

The old plan of ascending and descending the mines by ladders, so destructive to the health of the miners, is still largely in use. The ladders are now about 25 feet long, and set with a slope. There is a platform at the bottom of each called a *sollar*, with a man-hole in it leading to the next ladder beneath. Some of the Cornish mines are half a mile deep, so that it takes the miner an hour to reach the surface after he is done with his work; most of the journey being accomplished on wet, slippery ladders. The bad effects of the fatigue so produced is augmented by the fact that the men come from a constant temperature of 80° or 90° F. below, to one of perhaps 30° or 40° on the surface. Dr J. B. Sanderson states as the result of recent inquiries, that 90° F. is the highest limit of temperature consistent with healthy labor in a mine.

A great improvement on the ladder system is now in operation in several of the deep Cornish mines. It is a method first introduced into the deep mines of the Harz, and called the *Fuhr-kunst*. The plan of this "man-engine" is this. Two rods descend through the depth of the shaft, and upon these bracket-steps are fixed every 12 feet. The rods move up and down alternately through this distance by means of a reciprocating motion.

Some of the Cornish pumping-engines are very large and powerful. The cylinder of one of the largest is 7 feet 6 inches in diameter. With the expenditure of one bushel of coal, it can raise 100,000,000 lbs. weight one foot high; this is called its "duty." It lifts nearly 800 gallons of water per minute, and its cost was about £8000.

In Cornwall, the miners are divided into two classes; one of them called *tributers*, who take a two months' contract of a portion of the lode; the other called *intmen*, who are employed in sinking shafts, driving levels, &c.

A detailed analysis of one of the largest Cornish copper mines, published some years ago, shews that in that year it produced, in round numbers, 16,000 tons of ore, realising £90,000, and yielding a net profit of about £16,000. It employed about 700 miners, 300 laborers, 200 boys, and 300 women and girls. The cost for coal was £1800; for malleable iron and steel, £1300; for foundry castings, £2000; for ropes, £1000; for caudles, £1800; for gunpowder, £2000; and for timber, nearly £3000.

The last Mines Regulation Acts were passed in 1872 (amended in 1875). See MINES IN LAW.

*Mining for Coal.*—The minerals of the carboniferous formation, at least those which occur in beds or strata, as coal and clay ironstone, are mined, as has been already said, in a different way from metallic veins. Originally deposited in a horizontal position, they have been so altered by movements in the earth's crust, that they are rarely found so now. They are more generally found lying in a kind of basin or trough, with many minor undulations and dislocations. But however much twisted out of their original position, the different seams, more or less, preserve their parallelism, a fact of great service to the miner, since beds of shale, or other minerals, of a known distance from a coal seam, are often exposed when the coal itself is not, and so indicate where it may be found.

The great progress made of late years in the science of geology has made us so minutely acquainted with all the rock formations above and below the coal-measures, that it is now a comparatively easy matter to determine whether, in any given spot, coal may or may not be found. Nevertheless, large sums are still occasionally, as they have in past times been very frequently, wasted in the fruitless search for coal, where the character of the rocks indicates formations far removed from coal-bearing strata.

When there are good grounds for supposing that coal is likely to be found in any particular locality, before a pit is sunk, the preliminary process of "Boring" (q. v.) is resorted to, in order to determine whether it actually does exist there, and if in quantity sufficient to make the mining of it profitable. The usual mode of "winning" or reaching the coal is to sink a perpendicular shaft, but sometimes a level or cross-cut mine, and at other times, an inclined plane or "dook" is adopted. Before the introduction of pumping-engines, all coal-workings were drained by means of a level mine called a *day-level*, driven from the lowest available point on the surface, and no coal could be wrought at a lower depth than this, because there were no means of removing the water.

When the shaft has been sunk to the necessary depth, a level passage, called the *dip-head*, or *main-level*, is first driven on each side, which acts as a roadway or passage, and, at the same time, as a drain to conduct the water, which accumulates in the workings, by means of a gutter on one side, to the lodgment at the bottom of the shaft. This level is the lowest limit of the workings in the direction of the dip, and from it the coal is worked out as far as is practicable along the rise of the strata. There are two principal methods of mining the coal. One is termed the "post-and-stall" or "stoop-and-room" system, and is used for thick seams; the other is called the "long-wall" system, and is adopted for seams under four feet in thickness.

The *long-wall* system consists in extracting the entire seam of coal at the first working, the overlying strata being supported by the waste rock from the roof of the workings. It is necessary, however, to leave large stoops at the bottom of the shaft for its support, as in the stoop-and-room method. In long-wall workings, roads of a proper height and width require to be made for communication with the different parts of the mine.

The collier's usual mode of extracting the coal from its bed is this: With a light pick, he undercuts the coal-seam, technically termed "holing," for two or three feet inwards, and then, by driving in wedges at the top of the seam, he breaks away the portion which has been holed. Blasting is occasionally, but not often resorted to. For the past ten years, machines, some for "holing" only, and others for both "holing" and hewing down coal-seams, have been more or less in use. They usually work with compressed air, but sometimes with steam or water. It is still premature, however, to express any decided opinion as to their efficiency as compared with hand-labor. The coal, when separated from its bed, is put on tubs or hutches, which are generally drawn by horses, but sometimes by engine-power, along the roads to the bottom of the shaft, and hoisted to the surface.

The shaft is perhaps the most important portion of a coal-pit, and the principal parts of one are shown in the figure. The upper part shows the pit-head arrangements, the central part shows the force-pump, &c., and the lower part shows the pit-bottom arrangements. To make the section complete, the reader must imagine a great depth to intervene at the gaps A and B. There are four divisions in this shaft: the

Vertical Section of the Shaft of a Coal-pit, with a Detached Portion, shewing a Miner at work on the Coal Beam.

two centre ones, *a, a*, are used for sending up and down the men and the coal; the one on the right side, *b*, contains the pumps; and the remaining one on the left, *c*, is for withdrawing the vitiated air from the mine, and has usually a furnace at the bottom of it. In some pits a special shaft is applied to the ventilation, for which mechanical contrivances, such as ventilating fans, are now also partially introduced. Since the dreadful accident at the Hartley Colliery, in January 1862, caused by the beam of the engine breaking and closing up the shaft, an act of parliament has been passed making it imperative to have two shafts, or at least two outlets, to every coal-mine, as a means of escape, in case of an accident to one of them.

The cages *d, d*, by which the colliers ascend and descend, are also used for raising the coal. They are merely square plats of timber, with rails across them, for the convenience of running off and on the coal-hutches, *e*, and with a light iron frame, by which they are suspended to a flat wire-rope. On each cage there are iron clasps, which slide up and down on guide-rods. In the figure, two miners are shewn standing on one cage at the bottom of the shaft, and the other is at the top, with a coal-hutch upon it. The accidents resulting from the raising and lowering of the cages are numerous; many of them happen by the carelessness of the engine-man in not stopping the cage when it reaches the mouth of the pit, and so allowing it to be upset by over-winding. Many accidents also happen from the rope breaking. To prevent this, numerous "safety-cages" have been invented, most of which depend on the action of a spring, which is held in a certain position while the cage is suspended by the rope; but should the latter snap, the spring is suddenly relieved, and then grasping the guide-rods, prevents the cage from falling. Other safety-cages act by levers and clutches, but it is still disputed whether there is, on the whole, a decided advantage in using any of them, since they are all liable to get out of order. The man-engine, although not used in British collieries, is adopted in several on the continent, and is certainly the safest way of putting up and down men in a pit.

The steam-engine, *R*, works the pumps, in this case by a direct action, the pump-rods being attached to the piston-rod. The engine also winds up the cages, one of which ascends while the other descends—the barrel and other arrangements for which are shewn in the figure.

The proper ventilation of any mine, but especially of a coal-mine, is of very great importance. It clears the mine of the dangerous gases, fire-damp and foul-damp, dries the subterranean roadways, and furnishes the miners with a supply of pure air. Some idea of the general mode of ventilating a mine will be obtained by referring to the figure, where the arrows pointing downwards indicate the *downcast* shaft, and the arrows pointing upwards, the *upcast* one; and to the plan, where the atmospheric air, entering by the downcast shaft, passes along the roadways, as indicated by arrows. A number of doors and stops secure the travelling of the current in a proper direction, so as to reach the furthest recesses of the mine. It then returns by the upcast shaft, where, as has been already stated, it is usual to keep a furnace burning, to aid in withdrawing the impure air. It is very difficult, however, to secure efficient ventilation through all the zigzag windings of a mine; hence the frequent, and sometimes terrible explosions of fire-damp, or light carburetted hydrogen, which explodes when mixed with a certain proportion of atmospheric air; hence, also, the occasional accumulation of foul-damp (carbonic acid) in some pits, which suffocates any one breathing it. This deadly gas is always produced in large quantity by an explosion of fire-damp, and chokes many who have survived the violence of the explosion. Many collieries are so free of fire-damp, that the miners work with naked lights, but in others it is necessary to use the Safety Lamp (q. v.).

Besides the already mentioned sources of accident, there is the sudden falling-in of pieces from the roof of the workings. The following summary, made up from H.M. Inspector's returns, shews the number of lives lost, in proportion to the quantity of coal raised:

Total tons of mineral raised in Great Britain for the year 1876.....	148,969,365
Total number of lives lost in 1876.....	933
Average tons of mineral raised to each life lost.....	159,688

To shew the magnitude of some of the large coal-mines, it may be stated that the

Hetton Colliery, in Durham, yields 800,000 tons in the year, employs about 1000 men and 300 boys underground, and 300 people at the surface. The Monkwearmouth pit, near Newcastle, is 1900 feet deep, and its face-workings are two miles from the bottom of the shaft. Rosebridge Colliery, near Wigan, has the deepest shaft in England, being nearly 2500 feet deep. The sinking of some of the more difficult shafts has cost from £50,600 to £100,000 each.

**MINISTER**, a public functionary who has the chief direction of any department in a state. See **MINISTRY**. Also the delegate or representative of a sovereign at a foreign court to treat of affairs of state. Every independent state has a right to send public ministers to, and receive them from, any other sovereign state with which it desires to preserve relations of amity. Semi-sovereign states have generally been considered not to possess the *jus legationis*, unless when delegated to them by the state on which they are dependent. The right of confederated states to send public ministers to each other, or to foreign states, depends on the nature and constitution of the union by which they are bound together. The constitution of the United Provinces of the Low Countries and of the old German Empire preserved this right to the individual states or princes, as do the present constitutions of the German Empire and Swiss Confederation. The constitution of the United States either greatly modifies or entirely takes away the *jus legationis* of each individual state. Every sovereign state has a right to receive public ministers from other powers, unless where obligations to the contrary have been entered into by treaty. The diplomatic usage of Europe recognises three orders of ministers. Ministers of the first order possess the representative character in the highest degree, representing the state or sovereign sending them not only in the particular affairs with which they are charged, but in other matters: they may claim the same honors as would belong to their constituent, if present. This first class of diplomatic agents includes papal legates and nuncios, and ambassadors ordinary and extraordinary. A principle of reciprocity is recognised in the class of diplomatic agents sent. States enjoying the honors of royalty send to each other ministers of the first class; so also in some cases do those states which do not enjoy them; but it is said that no state enjoying such honors can receive ministers of the first class from those who are not possessed of them.

Ministers of the second and third order have not the same strictly representative character; their representation is not held to go beyond the affairs with which they are charged. They are, however, the natural protectors of the subjects of the state or country sending them in the country to which they are sent. Ministers of the second class include envoys, whether these are simply so styled, or denominated envoys extraordinary, and also ministers plenipotentiary. The third class of ministers does not differ from the second in the degree of their representative character, but only in the diversity of their dignity, and the ceremonial with which they are received. This class comprehends ministers, ministers resident, ministers chargés d'affaires, such consuls as are possessed of a diplomatic character, and those chargés d'affaires who are sent to courts to which it is not wished to send agents with the title of minister. Ministers of the third class have, for the most part, no letters-credencial from the sovereign, and are accredited only by letters to the foreign minister or secretary of the country to which they are sent.

Besides these orders of ministers, there are other diplomatic agents occasionally recognised—as deputies sent to a congress or confederacy of states, and commissioners sent to settle territorial limits or disputes concerning jurisdiction. These are generally considered to enjoy the privileges of ministers of the second and third order. Ministers-mediators are ministers sent by two powers, between which a dispute has arisen, to a foreign court or congress, where a third power, or several powers, have, with the consent of the two powers at variance, offered to mediate between them.

Diplomatic agents, except as already mentioned, those of the third class, are accredited by a letter to the sovereign of the country to which they are sent. The letter of credence is usually despatched under a *cachet volant*—i. e., a seal which does not close the letter; or else, in addition to the principal letter, an authenticated copy is sent, which the diplomatic agent on his arrival presents to the Minister or Secretary for Foreign Affairs, as his right to demand an audience of the sovereign; the original is presented to the sovereign. Ministers sent to a congress or diet have usually no credentials, but merely a full power, of which an authenticated

**Ministry**  
**Mink**

110

copy is delivered into the hands of a directing minister, or minister-mediator. A minister of the first class is received to both public and private audiences by the sovereign to whom he is accredited; a minister of the second class generally to private audiences only. Diplomatic agents are entitled to conduct negotiations either directly with the sovereign, or with the minister or secretary for foreign affairs. The latter course is the more usual, and generally the more convenient.

The title "Excellency" has, since the peace of Westphalia, been accorded to all diplomatic agents of the first class; and in some courts it is extended to ministers of the second class, or at least to those sent by the great powers. See **AMBASSADOR**, **ENVoy**, **CONSUL**. Under **AMBASSADOR**, the immunities and privileges enjoyed by diplomatic agents are explained.

**MINISTRY**, the body of ministers of state, or persons to whom the sovereign or chief magistrate of a country commits the executive government.

It is a principle of the constitution of Great Britain, that "the king can do no wrong;" that is to say, the sovereign personally is irresponsible for his acts, the real responsibility resting with the administrative government. The "King's Council," or **PRIVY COUNCIL**, were the earliest advisers of the sovereign in matters of state; but when this body came, in course of time, to be found too large for the dispatch of business, its duties were transferred to a small committee of privy councillors selected by the king. As late as in Charles I.'s time, all the more important resolutions of the crown were taken after deliberation and assent of the Privy Council. An unsuccessful attempt was made in the reign of Charles II. to restore the council to its original functions. Its numbers were limited to thirty; and it was intended that this limited council should have the control of the whole executive administration, superseding any interior cabinet. But the council was found too extensive for an effectively working ministry, and the former arrangement was restored. The **CABINET** or **MINISTRY** is now but a committee of the Privy Council; and its exclusive right to discuss and determine the plans and business of the government has been often said not to be recognised by the law, a position which, however, was disputed by Lord Campbell, who maintained that, "by our constitution, it is in practice a defined and acknowledged body for carrying on the executive government of the country." Proclamations and orders still issue from the Privy Council; and it is occasionally assembled to deliberate on public affairs, when only those councillors who are summoned attend. The cabinet is a merely deliberative body; its members collectively have no power to issue warrants or proclamations; but all important measures which engage the attention of the government, whether regarding matters domestic, foreign, or colonial, and all plans of action, whether purely administrative, or to be carried out in parliament, must be proposed, considered, and adopted by the cabinet. The sovereign intrusts the formation of a ministry to a statesman, who selects for the members of his cabinet those who are attached to his political views. He generally places himself at the head of the government as First Lord of the Treasury, and in popular language, he is called the Premier, or Prime Minister. The Lord Chancellor, the Chancellor of the Exchequer, the Secretaries of State for Home, Foreign, Colonial, and Indian affairs, the Secretary at War, and the President of the Council, are necessarily members of the cabinet; and with them are associated the heads of various other important departments of government, including generally the First Lord of the Admiralty, the President of the Board of Trade, the Postmaster-general, the President of the Poor-law Board, the Chancellor of the Duchy of Lancaster, and occasionally the Chief Secretary for Ireland. The Premier has sometimes held the office of Chancellor of the Exchequer in conjunction with that of First Lord of the Treasury. A privy councillor of great political weight is sometimes called into the cabinet without office, and takes the post of Lord Privy Seal. Her Majesty's ministers include the following, who have usually no seat in the cabinet: the Chief Secretary for Ireland, the First Commissioner of Works, the Vice-president of the Board of Trade, the Vice-president of the Committee on Education, the Commander-in-chief, the Lord Chamberlain, the Steward, the Master of the Horse, the Master of the Buckhounds, the Comptroller of the Household, the Lord Lieutenant of Ireland, the Attorney-general and Solicitor-general of England, the Lord Advocate and Solicitor-general of Scotland, and the Attorney-general and Solicitor-general of Ireland. Occasionally, but exceptionally, the Commander-in-chief, and the Lord Chief Justice of England, have

been members of the cabinet. A ministry is often spoken of as the ministry of the person who is at its head.

Meetings of the cabinet are held on the summons of any one of its members, usually at the Foreign Office. Its proceedings are secret and confidential, and no record is kept of its resolutions, which are carried into effect by those of its members to whose departments they severally belong. As the acts of a ministry are at all times liable to be called in question in parliament, it is necessary that the heads of the chief departments should have seats in either House, in order to be able, when required, to give prompt explanations.

A government exists only so long as it can command the confidence of parliament. The sovereign has the power to dismiss his ministers whenever they cease to possess his confidence, but such a change would be useless without the support of the House of Commons, who, by withholding their support, could paralyse all the functions of government. A sovereign has sometimes got rid of a ministry with whose policy he was dissatisfied, by dissolving parliament, and appealing to the country. Where a ministry cannot command the confidence of parliament, they resign, and a statesman of some other political party is sent for by the sovereign, and authorised to form a new cabinet. All the adherents of a ministry filling political offices resign along with it, as also the great officers of the court, and those officers of the royal household who have seats in either house of parliament. Sometimes officers holding lucrative appointments which do not necessitate resignation, have retired, as a manifestation of adherence to their political friends. In addition to the ministers already named, the following adherents of the ministry go out of office on a change of government: the three junior Lords of the Treasury, the two Secretaries of the Treasury, the four parliamentary Under-secretaries of State, the Paymaster-general, the Master-general of the Ordnance, the Surveyor-general of the Ordnance, the five junior Lords of the Admiralty, the first Secretary of the Admiralty, the Chief Commissioner of Greenwich Hospital, the President and Parliamentary Secretary of the Poor-law Board, the President of the Board of Health, the Vice-chamberlain, the Captain of the Gentlemen-at-arms, the Captain of the Yeomen of the Guard, the Lords in Waiting, the Mistress of the Robes, the Treasurer of the Household, the Chief Equerry, or Clerk Marshal, the Judge Advocate-general, and the Lord Chancellor for Ireland. The private secretary to a minister loses office on a change, his appointment being a purely personal one; and some changes are generally, though not always made in ambassadors extraordinary.

In 1839, when Viscount Melbourne's ministry resigned, Sir Robert Peel, who was intrusted by the Queen with the formation of a new ministry, proposed that, in order to give public proof of her Majesty's confidence, the change should include the chief appointments held by the ladies of her Majesty's household. The Queen, counselled by Lord Melbourne, refused her consent to this proposal, on the ground of its being contrary to the latest precedents of the reign of Queen Anne. Sir Robert, however (with whose opinion the Duke of Wellington expressed concurrence), considered the change a necessary one; and as he refused to undertake the formation of a government without its being adopted, the result was that Lord Melbourne and his colleagues were reinstated. At a council held on their resuming office, it was resolved, "That for the purpose of giving to the administration the character of efficiency and stability, and those marks of the constitutional support of the crown that are requisite to enable it to act usefully to the public service, it is reasonable that the great officers of the court, and situations in the household held by members of parliament, should be included in the political arrangements made in a change of the administration. But they are not of opinion that a similar principle should be applied or extended to the offices held by ladies in her Majesty's household."

**MINIUM** (Lat. red-lead). See **LEAD**.

**MINK** (*Mustela lutreola*), a species of weasel, inhabiting the northern parts of Europe and Asia; very similar to which in characters and habits is another species, by some regarded as only a variety of the same, the *M. or* *Vison* (*M. vison*) of North America, abundant in almost every part of that continent. Both inhabit the neighborhood of streams, lakes, and marshes; have semi-palmated feet, are expert swimmers and divers, and prey on fishes, frogs, and other aquatic animals, as well as on birds, rats, mice, &c. They are covered with a downy fur, interspersed with longer

**Minnesingers**  
**Minor**

112

and stronger hairs: the color is brown, with more or less of white on the under parts. The American *M.* is generally larger than that of the Old World, being often more than eighteen inches from the nose to the root of the tail, whilst the latter is seldom more than twelve. It has also a more bushy tail. It is very active and bold, and often commits great depredations in poultry-yards, carrying off a fowl with great ease. Unlike most of its congeners, it is easily tamed, and becomes much attached to those who caress it. In domestication, it ceases to regard the inmates of the poultry-yard as prey. It emits an unpleasant odor only when irritated or alarmed. The fur of the *M.* is valuable.

**MINNESINGERS**, a designation applied to the earliest lyric poets of Germany in the 12th and 13th centuries, and derived from the word *Minne*, or love, which was at first the predominating, and almost sole subject treated of in their productions. The works of the *M.* are for the most part superior to those of their more generally known contemporaries, the troubadours, both in regard to delicacy of sentiment, elegance and variety of rhythmical structure, and grace of diction. Henry of Vel-dig, who flourished in the beginning of the 12th c. at the court of the Swabian, Frederick Barbarossa, Emperor of Germany, is regarded as the father of the *M.*, and Walther von der Weide, who was born about 1170, as the last of this great vocal band, which included emperors, princes, nobles, and knights. Many of their productions have of course perished, although, in addition to a very large collection of poems by anonymous *M.*, we still possess some remains of the songs of more than 150 known composers. Among the most celebrated of these, special notice is due to Wolfram von Eschenbach (q. v.), Henry von Ofterdingen, Hagenaue, Hartmann von der Aue (q. v.), Gottfried von Strassburg (q. v.), Otto von Botenlauben, Truchsees von St Gall, and Ulrich von Lichtenstein—men of noble houses, who, although they belonged to every part of Germany, wrote almost exclusively in the Swabian dialect, which, during the brilliant days of the Fredericks and Conrads of the House of Swabia, was the language of the court in Germany. Among the few other forms of German employed by the *M.*, the one next in favor was the Thuringian, adopted in compliment to Hermann, Landgraf of Thuringia, who, next to the princes of the Swabian dynasty, was the most munificent patron of the *M.* during the period of their renown, in the early part of the 13th century. Besides songs in praise of women, the *M.* composed odes on public or private occasions of lament or joy, distiches or axioms, and "Wachtlieder," or watch-songs, in which the lover was represented as expostulating with the watchman, who kept guard at the gate of the castle within which his lady-love was imprisoned, and trying to persuade him to grant him admittance to her presence. These songs and odes were recited by the composer, to his own accompaniment on the viol; and as few of the *M.* could write, their compositions were preserved mostly by verbal tradition only, and carried by wandering minstrels from castle to castle throughout Germany, and even beyond its borders. As the variety of rhythm and complicated forms of versification affected by the *M.*, more especially towards the decline of their art, rendered it difficult to retain by memory the mass of Minnesong which had been gradually accumulated, these itinerant musicians finally made use of written collections, a practice to which alone we are indebted for the many beautiful specimens of early German lyrical poetry which we yet possess. The glory of the *M.* may be said to have perished with the downfall of the Swabian dynasty, under which greater liberty of thought and word was allowed among Germans than they again enjoyed for many ages; and in proportion as the church succeeded in re-asserting its sway over the minds of men, which it had lost under the rule of the chivalric Fredericks, freedom of speech and action was trammelled, and song and poetry condemned. Paraphrases of Scripture, hymns, and monkish legends, took the place of the chivalric songs of the nobly born *M.*, and German poetry was for a time almost annihilated.

In the 14th c., the art of Minnesong was partially revived, although under a rude and clumsily elaborated form, by the *Meister-singers*, a body of men belonging to the burgher and peasant classes, who, in accordance with their artisan habits, formed themselves into guilds or companies, which bound themselves to observe certain arbitrary laws of rhythm. Nuremberg was the focus of their guilds, which rapidly spread over the whole of Germany, and gained so firm a footing in the land, that the last of them was not dissolved at Ulm till 1839. As the title of Master was only

awarded to a member who invented a new form of verse, and the companies consisted almost exclusively of uneducated persons of the working-classes, it may easily be conceived that extravagances and absurdities of every kind speedily formed a leading characteristic of their modes of versification; attention to quantity was, moreover, not deemed necessary, regard being had merely to the number of the syllables, and the relative position and order of the verses and rhymes. Their songs were lyrical, and sung to music; and although, as before remarked, each master was bound to devise a special *stols* or order of rhymes for each of his compositions, these *stols* were subjected to a severe code of criticism, enacted by the *Tabulatur*, or rules of the song-schools. Among the few Masters who exhibited any genuine poetic feeling, the most noted were Heinrich Mügelin, Michael Behalm, and the Nuremberg shoemaker, Hans Sachs, who prided himself on having composed 4275 "Bar" or Master Songs. See Tieck's "Minnelieder" (1803); Taylor's "Lays of the Minne and Master Singers" (Lond. 1825); and Von der Hagen's "Minnesänger" (4 vols. 1838).

**MINNESO'TA**, one of the United States of America, lies in lat.  $43^{\circ} 30'$ — $49^{\circ}$  n., and long.  $89^{\circ} 29'$ — $97^{\circ} 5'$  w. It is 380 miles in extreme length from north to south, and from 183 to 337 from east to west, containing an area of 88,531 square miles. It is bounded on the n. by the British possessions, from which it is separated by the chain of lakes and rivers connecting the Lake of the Woods with Lake Superior, and by the 49th parallel of latitude; e. by Lake Superior and Wisconsin; s. by Iowa; and w. by Dakota Territory (q. v.), from which it is partly divided by the Red River of the North. It contains 75 counties, and its chief towns are St Paul, the capital, Red Wing, Winona, Hastings, Minneapolis, &c. M. contains the summit of the central table-land of the North American continent, where, within a few miles of each other, are the sources of rivers which find their outlets in Hudson's Bay, the Gulf of St Lawrence, and the Gulf of Mexico. The state is abundantly watered by the Mississippi, Minnesota, Red River of the North, Rainy Lake River, and their branches, and has more than 1500 miles of navigable rivers. The country abounds also in lakes and ponds. The sources of the great rivers are 1680 feet above the level of the sea. Though the most northerly state in the Union, M. is one of the most beautiful, fertile, and salubrious. The winters are long and cold, but equable, and the country is rich in fertile lands and forests. The clear waters are stored with fish, and game is abundant. The scenery is varied and beautiful. The Falls of St Anthony on the Mississippi afford abundant water-power. Near these is the beautiful cascade of the Minnehaha, or Laughing Water, 45 feet perpendicular, and a cavern, explored to the depth of 1000 feet. M. began to be settled in 1845, though it was explored by the French, and trading-posts established, in 1680. The chief route to the British settlements of the Red River of the North lies through Minnesota. The state has plenty of good timber, and is rich in minerals, including gold, iron, copper, coal, and lead. In 1870, its agricultural products were valued at \$53,446,400. In the same year it had 6 universities and colleges, and 2424 public schools. In January 1875, 1940 miles of railway were completed, and about 1000 more projected, towards which grants of land have been made to the extent of nearly \$4,500,000. Powerful Indian tribes occupy portions of the state. The state government was organised in 1858. Pop. in 1860, 172,023; in 1880, 780,773.

**MINNESOTA**, or St Peter's River, rises near the eastern boundary of Dakota Territory, United States of America, runs south-east 800 miles, to South Bend, then north-east 120 miles, and falls into the Mississippi at Mendota. It is navigable for 40 miles by steam-boats.

**MINNOW** (*Leuciscus phoxinus*), a small fish of the same genus with the roach, dace, chub, &c., of a more rounded form than most of its congeners, a common native of streams with gravelly bottoms in most parts of Britain. It seldom exceeds three inches in length, the head and back of a dusky olive color, the sides lighter and mottled, the belly white, or, in summer, pink. Minnows swim in shoals, feed readily either on animal or vegetable substances, if sufficiently soft, and are said to be very destructive to the spawn of salmon and of trout. Very young anglers generally begin their sport by catching minnow. The M. is a fish of very pleasant flavor. A casting-net affords the means of taking it in sufficient abundance. It is a favorite bait for pike and large trout or perch.

**MINOR**, a term in Music. 1. In the nomenclature of intervals. The interval

between any note and another is named according to the number of degrees between them on the scale, both notes included. The interval between C and E is called a third; that between E and G is also a third; but these intervals are unequal, the one consisting of four semitones, the other of three; the former is therefore distinguished as a major, the latter as a minor interval. 2. The term is also applied to one of the two modes in which a musical passage may be composed. The scale of the minor mode differs from that of the major mode in the third of its key-note being a minor instead of a major third. See MUSIC, MODE.

MINOR is, in Scotch Law, the term describing a person who, if a male, is between the ages of 14 and 21; and if a female, is between 12 and 21. In the preceding period, he or she is called a Pupil. In England, the technical term is an Infant (q. v.), which includes all persons, male and female, under the age of 21. In Scotland, a minor is for many purposes *sui juris*, and can marry without anybody's consent, and can also make a will of movable property. For the purpose, however, of managing his real property and making contracts, curators are often necessary. See INFANT, RESTITUTION, GUARDIAN.

MINOR BARONS. The word baron, in the earliest period of feudalism, signified one who held lands of a superior by military tenure. The superior might be the sovereign, or he might be an earl or other eminent person, who held of the sovereign. According as he was the one or the other, the baron was, in the earliest sense of the distinction, a greater or lesser baron. At the Conquest, a large part of the soil of England was parcelled by William the Norman among his military retainers, who were bound in return to perform services, to do homage, and to assist in administering justice, and in transacting the other business done in the court of the king. 400 of these tenants-in-chief of the crown are enumerated in Domesday (q. v.), including among them "vicecomites" and "conites," who together constituted the body of men called the Barons of England. As the sovereign was entitled to demand from the barons military service, homage, and attendance in the courts, so, many of the principal barons, particularly such of them as were earls, had military tenants, from whom they in turn received homage and assistance in administering justice in their baronial courts. These tenants were barons of the barons, or, in the earliest sense, minor barons; but by the usage of England, from the Conquest downwards, they were seldom called barons, that term having been generally restricted to the former class, the holders of land direct from the crown, who were next to the king in dignity, formed his army and his legislative assembly, and obtained the Great Charter from King John. The subinfeudation which produced the minor barons was checked by a statute of Edward I., directing that all persons acquiring lands from a subject should hold, not of that subject, but of his superior.

Out of the "commune concilium" of the king, at which all his barons were bound to attend, arose the parliament. It is not till the close of Henry III.'s, or beginning of Edward I.'s reign that we find a select number instead of the whole barons attending. The exact period of the change, and the way in which it was made, are still among the obscure points of English history; it has been thought that after the rebellion which was crushed at the battle of Evesham, Henry III. summoned only those barons who were most devoted to his interest. From this period, a new distinction between major and minor barons arose, the latter term being no longer applied to the barons of the barons, but to those barons of the crown who were no longer summoned by writ to parliament. The word baron was more and more used in the restricted sense of a baron of parliament, and the right or duty of attendance came in process of time to be founded, not on the tenure, but on the writ.

In Scotland, the barons (or lords) were such persons as held their lands directly of the crown. They were the king's advisers, witnessed his charters, and possessed a civil and criminal jurisdiction. All had to give attendance in the Scottish parliament, which consisted of the earls and barons sitting together. After the reign of James I., some of the more powerful barons appear more exclusively as lords of parliament, those whose incomes were below a certain amount obtaining a dispensation from attendance; yet all possessed a right to attend parliament till 1587, when the barons not specially created lords of parliament were required, in place of personally attending, to send representatives of their order from each sheriffdom. The term baron, however, still continued in Scotland to be applied to the whole body of tenants

as *capite*, such of them as were lords of parliament being distinctively major, and the others minor barons; but all continuing up to 1747 to possess an extensive civil jurisdiction, and a criminal jurisdiction, from which only treason and the four pleas of the crown were excluded. The representative minor barons sat in the same House with the major barons, and their votes continued down to the union to be recorded as those of the "Small Barrounia."

**MINORCA**, the largest of the Balearic Isles (q. v.), after Majorca, from which it is distant 25 miles north-east. It is 81 miles long, and 15 miles in greatest breadth, with an area of about 300 square miles. Pop. 37,262. Its coast, broken into numerous bays and inlets, is fringed with islets and shoals, and its surface, less mountainous than that of Majorca, is undulating, rising to its highest point in Mount Toro, 4793 feet above sea-level. Its productions are similar to those of the larger island, although it is neither so fertile in soil nor so well watered as Majorca. The chief towns are Port Mahon (q. v.), and Ciudadela. The annual exports are worth £110,000; the imports, £100,000.

**MINORITIES**, a name of the Franciscan order (q. v.), derived from the original later denomination adopted by their founder, *Fratres Minores*. This name has left its trace in the popular designation of several localities both in English and foreign lands.

**MINOS**, the name of two mythological kings of Crete. The first is said to have been the son of Jupiter and Europa, the brother of Rhadamanthus, the father of Deucalion and Ariadne, and, after his death, a judge in the infernal regions.—The second of the same name was grandson of the former, and son of Lycastus and Ida. To him the celebrated "Laws of Minos" are ascribed, in which he is said to have received instruction from Jupiter. He was the husband of that Pasiphaë who gave birth to the Minotaur (q. v.). Homer and Hesiod know of only one Minos, the king of Cnosus, and son and friend of Jupiter.

**MINOTAUR** (i. e. the Bull of Minos), one of the most repulsive conceptions of Grecian Mythology, is represented as the son of Pasiphaë and a bull, for which she had conceived a passion. It was half-man half-bull, a man with a bull's head. Minos, the husband of Pasiphaë, shut him up in the Cnosian Labyrinth, and there fed him with youths and maidens, whom Athens was obliged to supply as an annual tribute, till Theseus, with the help of Ariadne, slew the monster. The M. is, with some probability, regarded as a symbol of the Phœnician sun-god.

**MINSK**, a government and province of Western or White Russia, lies south-east of Wilna, and contains 34,860 sq. m., with a population (1870) of 1,182,230, composed chiefly of Russians, Lithuanians, Poles, and Jews, with a small percentage of Tartars and gipsies. Five-sevenths of the population profess the Greek religion. The chief articles of export are timber, salt, and corn, which are brought by river-carriage to the Baltic and Black Sea ports. The principal manufactures are fine cloths, linen, and sugar. The soil is not fertile, and is covered to a large extent with woods and marshes, while in many other places it is a sandy waste, but in general the native products suffice for the wants of the inhabitants. The climate is very severe in winter. Cattle and sheep breeding are pursued with tolerable success. The inhabitants of the south or marshy portion of the province are subject to that dreadful disease, the *Plica Polonica* (q. v.).

**MINSK**, the chief town of the government of the same name, is situated on the Bzeloetz, an affluent of the Beresina. It is mostly built of wood, but has many handsome stone edifices, among which are the Greek and Roman Catholic cathedrals and seminaries, the church of St Catharine, a number of educational and philanthropic establishments, a public library, and a theatre. The chief manufactures are woollen cloth and leather. Pop. (1867) 34,277, many of whom are Jews.

**MINSTER**. See **MONASTERY**.

**MINT** (*Mentha*), a genus of plants, of the natural order *Labiata*; with small, funnel-shaped, 4-ld, generally red corolla, and four straight stamens. The species are perennial herbaceous plants, varying considerably in appearance, but all with creeping root-stocks. The flowers are whorled, the whorls often grouped in spikes or heads. The species are widely distributed over the world. Some of them are

very common in Britain, as WATER M. (*M. aquatica*), which grow in wet grounds and ditches, and CORN M. (*M. arvensis*), which abounds as a weed in cornfields and gardens. These and most of the other species have erect stems. All the species contain an aromatic essential oil, in virtue of which they are more or less medicinal. The most important species are SPEARMINT, PEPPERMINT, and PENNY-ROYAL.—SPEARMINT or GREEN M. (*M. viridis*), is a native of almost all the temperate parts of the globe; it has erect smooth stems, from one foot to two feet high, with the whorls of flowers in loose cylindrical or oblong spikes at the top; the leaves lanceolate, acute, smooth, serrated, destitute of stalk, or nearly so. It has a very agreeable odor.—PEPPERMINT (*M. Piperita*), a plant of equally wide distribution in the temperate parts of the world, is very similar to spearmint, but has the leaves stalked, and the flowers in short spikes, the lower whorls somewhat distant from the rest. It is very readily recognised by the peculiar pungency of its odor and of its taste.—PENNY-ROYAL (*M. pulegium*), also very cosmopolitan, has a much-branched prostrate stem, which sends down new roots as it extends in length; the leaves ovate, stalked; the flowers in distant globose whorls. Its smell resembles that of the other mints. All these species, in a wild state, grow in ditches or wet places. All of them are cultivated in gardens; and peppermint largely for medicinal use and for flavoring lozenges. *Mint Sauce* is generally made of spearmint; which is also used for flavoring soups, &c. A kind of M. with lemon-scented leaves, called BERGAMOT M. (*M. citrata*), is found in some parts of Europe, and is cultivated in gardens. Varieties of peppermint and horse-mint (*M. sylvestris*), with *crisped* or *inflato-rugoso* leaves, are much cultivated in Germany under the name of CURLED M. (*Krause-minze*); the leaves being dried and used as a domestic medicine, and in poultices and baths. All kinds of M. are easily propagated by parting the roots or by cuttings. It is said that mice have a great aversion to M., and that a few leaves of it will keep them at a distance.

Peppermint, Penny-royal and Spearmint, are used in medicine. The pharmacopœias contain an *aqua*, *spiritus*, and *oleum* of each of them; the official part being the herb, which should be collected when in flower. *Peppermint* is a powerful diffusible stimulant, and, as such, is antispasmodic and stomachic, and is much employed in the treatment of gastrodynia and flatulent colic. It is also extensively used in mixtures, for covering the taste of drugs. *Penny-royal* and *spearmint* are similar in their action, but inferior for all purposes to peppermint. The ordinary doses are from one to two ounces of the *aqua*, a drachm of the *spiritus* (in a wine-glassful of water), and from three to five drops of the *oleum* (on a lump of sugar).

MINT (Lat. *moneta*), an establishment for making coins or metallic money (see MONEY). The early history of the art being traced under the head NUMISMATICA, the present article is mostly confined to a sketch of the constitution of the British mint, and of the modern processes of coining as there followed.

The earliest regulations regarding the English mint belong to Anglo-Saxon times. An officer called a reeve is referred to in the laws of Canute as having some jurisdiction over it, and certain names which, in addition to that of the sovereign, appear on the Anglo-Saxon coins, seem to have been those of the moneyers, or principal officers of the mint, till recently, an important class of functionaries, who were responsible for the integrity of the coin. Besides the sovereign, barons, bishops, and the greater monasteries had their respective mints, where they exercised the right of coinage, a privilege enjoyed by the archbishops of Canterbury as late as the reign of Henry VIII., and by Woolsey as Bishop of Durham, and Archbishop of York.

After the Norman Conquest, the officers of the royal mint became to a certain extent subject to the authority of the exchequer. Both in Saxon and Norman times, there existed, under control of the principal mint in London, a number of provincial mints in different towns of England; there were no fewer than 88 in the time of Ethelred, and the last of them, were only done away with in the reign of William III. The officers of the mint were formed into a corporation by a charter of Edward II.; they consisted of the warden, master, comptroller, assay-master, workers, coiners, and subordinates.

The signorage for coining at one time formed no inconsiderable item in the revenues of the crown. It was a deduction made from the bullion coined, and comprehended both a charge for defraying the expense of coinage, and the sov-

ereign's profit in virtue of his prerogative. In the reign of Henry VI., the seignorage amounted to 6*d.* in the pound; in the reign of Edward I., 1*s.* 2½*d.* By 1*s.* Car. II. c. 5, the seignorage on gold was abolished, and has never since been exacted. The share, or remedy, as it is now called, was an allowance for the unavoidable imperfection of the coin.

The function of the mint is in theory to receive gold in ingots from individuals, and return an equal weight in sovereigns; but, in point of fact, gold is now exclusively coined for the Bank of England; for, though any one has still the right to coin gold at the mint, the merchant or dealer has ceased to obtain any profit for so doing, as the Bank is compelled to purchase all gold tendered to it at the fixed price of £3, 17*s.* 9*d.* an ounce. The increment on the Assay (q. v.), or on the fineness of the metal, which augments the standard weight, and therefore the value of the gold, is a more considerable source of profit to the importer of gold. The ordinary trade assay, on which the importer purchases the bullion, does not by usage come closer than ⅓ of a carat grain or 7½ grains per lb. troy. Before being coined, the gold is subjected to a second and more delicate assay at the mint, and the importer receives the benefit of the difference, amounting to about 1-16th of a carat grain = 3¼ troy grains, or nearly 8*d.* per lb. weight.

Silver, which was formerly, concurrently with gold, a legal tender to any amount, has, by 56 Geo. III. c. 68, ceased to be so. There is a seignorage on both silver and copper money, amounting in silver to 10 per cent., when the price of silver is 5*s.* per ounce, which, however, from the tear and wear of the coin, brings small profit to the crown. On the copper coinage, the seignorage is no less than 100 per cent. on the average price of copper. The profits of the seignorage, formerly retained by the master of the mint, to defray the expense of coinage, have, since 1837, been paid into the bank, to the credit of the Consolidated Fund.

A new mint was erected on Towerhill in 1810. In 1815, some alterations were made in its constitution; and in 1831 a complete change was introduced in the whole system of administration. The control of the mint was vested in a master and a deputy-master, and comptroller. The mastership, which had, in the early part of the present century, become a political appointment held by an adherent of the government, was restored to the position of a permanent office, the master being the ostensible executive head of the establishment. The operative department was intrusted to the assayer, the melter, and the refiner. The moneyers, who had from early times enjoyed extensive privileges and exemptions, and were contractors with the crown for the execution of the coinage, were abolished, and the contracts with the crown were entered into by the master of the mint, who also made subordinate contracts for the actual manufacture of the coin. Further changes were made on the administration of the mint in 1869. The mastership was added to the duties of the Chancellor of the Exchequer, without any addition of salary, and the offices of deputy-master and comptroller were amalgamated. A yearly saving of £10,000 is believed to have been effected by the changes of 1851, and a further £8000 by those of 1869, with an increase of efficiency. It is at present in contemplation to remove the mint from Towerhill to the rear of the Thames Embankment at Whitefriars, with new and improved machinery. Mints have lately been established at Sydney and Melbourne to coin the gold so largely found in Australia.

*Processes of coining.*—Down to the middle of the 16th c., little or no improvement seems to have been made in the art of coining from the time of its invention. The metal was simply hammered into slips, which were afterwards cut up into squares of one size, and then forged round. The required impression was given to these by placing them in turn between two dies, and striking them with a hammer. As it was not easy by this method to place the dies exactly above each other, or to apply proper force, coins so made were always faulty, and had the edges unfinished, which rendered them liable to be clipped. The first great step was the application of the screw, invented in 1553 by a French engraver of the name of Brucher. The plan was found expensive at first, and it was not till 1662 that it altogether superseded the hammer in the English mint. The chief steps in coining as now practised are as follows: The gold or silver to be coined is sent to the mint in the form of *ingots* (Ger. *eingiessen*, Du. *ingieten*, to pour in, to cast), or castings; those of gold weighing each about 180 oz., while the silver *ingots* are much larger. Before melting, each ingot is tested as to its purity by assaying (q. v.), and then

weighed, and the results carefully recorded. For melting the gold, pots or crucibles of plumbago are used, made to contain each about 1200 oz. The pots being heated white, in furnaces, the charge of gold is introduced along with the proper amount of copper (depending upon the state of purity of the gold as ascertained by the assay), to bring it to the standard, which is 22 parts of pure gold to 2 of copper (see ALLOY). The metal when melted is poured into iron moulds, which form it into bars 21 inches long,  $1\frac{3}{4}$  inch broad, and 1 inch thick, if for sovereigns; and somewhat narrower, if for half-sovereigns. For melting silver (the alloy of which is adjusted to the standard of 222 parts of silver to 18 of copper), malleable iron pots are used, and the metal is cast into bars similar to those of gold.

The new copper, or rather bronze coinage, issued in 1860, is an alloy consisting of 95 parts of copper, 4 of tin, and 1 of zinc. The coins are only about half the weight of their old copper representatives. The processes of casting and coining the bronze are essentially the same as in the case of gold and silver.

The operation of *rolling* follows that of casting. It consists in repeatedly passing the bars between pairs of rollers with hardened steel surfaces, driven by steam-power; the rollers being brought closer and closer as the thickness becomes reduced. At a certain stage, as the bars become longer, they are cut into several lengths; and to remove the hardness induced by the pressure, they are annealed. The finishing rollers are so exquisitely adjusted that the *fillets* (as the thinned bars are called) do not vary in thickness in any part more than the ten-thousandth part of an inch. The slips are still further reduced in the British mint at what is called the "draw-bench," where they are drawn between steel dies, as in wire-drawing, and are then exactly of the necessary thickness for the coin intended.

The fillets thus prepared are passed to the tryer, who, with a hand-punch, cuts a trial-blank from each, and weighs it in a balance; and if it vary more than  $\frac{1}{8}$ th of a grain, the whole fillet is rejected.

For cutting out the *blanks* of which the coins are to be made, there are in the British mint twelve presses arranged in a circle, so that one wheel with driving cams, placed in the centre, works the whole. The punches descend by pneumatic pressure, and the fillets are fed into the presses by boys, each punch cutting out about 60 blanks a minute. The scrap left after the blanks are cut out, called *scissel*, is sent back to be remelted.

Each blank is afterwards weighed by the automaton balance—a beautiful and most accurate instrument, which was added to the mint about twenty years ago. It weighs 23 blanks per minute, and each to the 0.01 of a grain. The standard weight of a sovereign is 123.274 grains, but the mint can issue them above or below this to the extent of 0.2568 of a grain, which is called *the remedy*. Blanks which come within this limit are dropped by the machine into a "medium" box, and pass on to be coined. Those below the required weight are pushed into another box to be remelted, but those above it into another, and are reduced by filing. The correct blanks are afterwards rung on a sounding iron, and those which do not give a clear sound are rejected as dumb.

To insure their being properly milled on the edge, the blanks are pressed edgewise in a machine between two circular steel-plates, which raises the edges, and at the same time secures their being perfectly round. After this they are annealed to soften them, before they can be struck with dies; they are also put into a boiling pot of dilute sulphuric acid, to remove any oxide of copper from the surface. Subsequently, they are washed with water, and dried with great care in hot sawdust, and finally in an oven at a temperature slightly above boiling water. Without these precautions, the beautiful bloom upon new coin could not be secured.

We now come to the press-room, where the blanks receive the impression which makes them perfect coins. The coining-presses, eight in all, are ranged in a row upon a strong foundation of masonry. There is the massive iron frame into which the screw works, the upper part being perforated to receive it. On the bottom of this screw the upper steel die is fixed by a box, the lower die being fixed in another box attached to the base of the press. The dies have, of course, the obverse and reverse of the coin upon them. See *DIE-SINKING*. The blank coin is placed on the lower die, and receives the impression when the screw is turned round so as to press the two dies forcibly towards each other. A steel ring or collar contains the coin while it is being stamped, which preserves its circular form, and also effects the

milling on the edge. In cases where letters are put on the edge of a coin, a collar divided into segments working on centre-pins, is used. On the proper pressure being applied, the segments close round, and impress the letters on the edge of the coin.

The screw of the press is worked by machinery driven by steam-power, and situated in an apartment above the coining-room. The steam-engine exhausts an air-chamber, and from the vacuum produced, an air-engine works a series of air-pumps, which communicate a more exact and regular motion to the machinery of the stamping-presses than by the ordinary condensing engine. The loaded arms strike against blocks of wood, whereby they are prevented from moving too far, and run the risk of breaking the hard steel dies by bringing them in contact. The press brings down the die on the coin with a twisting motion, but if it were to rise up in the same way, it would abrade the coin; there is, in consequence, an arrangement which, by means of a wide notch in the ring, allows the die to be raised up a certain distance before it begins to turn round with the screw.

On the left, is an arrangement for feeding the blanks and removing the coins as they are stamped. A lever, moving on a fulcrum, is supported by a bar fixed to the side of the press. The top of this lever is guided by a sector fixed upon the screw. In this sector there is a spiral groove, which, as the screw turns round, moves the end of the lever to or from the screw, the other end being moved at the same time either towards or away from the centre of the press. The lower end of the lever moves a slider, which is directed exactly to the centre of the press, and on a level with the upper surface of the die. The slider is a thin steel-plate in two pieces united by a joint, and having a circular cavity at the end, which, when its limbs are shut, grasps a piece of coin by the edge. This piece drops out on the limit separating. There is a tube which an attendant keeps filled with blank pieces; it is open at the bottom, so that the pieces rest on the slider. When the press is screwed down, the slider is drawn back to its farthest extent, and its circular end comes exactly beneath the tube. A blank piece of coin now drops in, and is carried, when the screw rises, to the collar which fits over the lower die. The slider then returns for another blank, while the upper die descends to give the impression to the coin. Each time the slider brings a new blank to the die, it at the same time pushes off the piece last struck. An arrangement of springs lifts the milled collar to enclose the coin while it is being struck.

It is found on examining the coins that about 1 in 200 is imperfectly finished; these being rejected, the rest are finally weighed into bags, and subjected to the process of *piecing*. This consists in taking from each bag a certain number of sovereigns or other coins, and subjecting them to a final examination by weight and assay, before they are delivered to the public.

**MINUET**, the air of a most graceful dance, originally from Polton, in France. It is performed in a slow tempo. The first minuet is said to have been composed by Lully the Elder, and was danced by Louis XIV. in 1653. at Versailles, with his mistress. The music of the minuet is in  $\frac{3}{4}$  time, and is still well known in England by the celebrated *Minuet de la Cour*, which is frequently introduced in stage performances.

**MINUTE**, a rough draft of any proceeding or instrument; so called from being taken down shortly and in *minute* or small writing, to be afterwards ingrossed. See **INGROSS**.—**MINUTE**, in Law, is a memorandum or record of some act of a court or of parties; in the latter sense, it is used chiefly in Scotland, as in the case of minute of agreement, minute of sale, &c.

**MINUTE**, the 60th part of an hour; also the 60th part of a degree of a circle. See **SEXAGESIMAL ARITHMETIC**.—**MINUTE**, in Architecture, is the 60th part of the diameter of the shaft of a classic column, measured at the base. It is used as a measure to determine the proportions of the order.

**MIOCENE** (Gr. less recent), a term introduced by Lyell to characterise the Middle Tertiary strata, which he supposes to contain a smaller proportion of recent species of mollusca than the newer Pliocene, and more than the older Eocene. He estimates the proportion of living to fossil species in the Miocene at 25 per cent.

Strata of this age occur in Britain in two limited and far separated localities—in the island of Mull, and at Dartmoor in the south-east of England. In this last dis-

Mirabeau  
Miracle

120

trict, they exist at Bovey Tracey, in a flat area of ten miles long by two miles broad, and consist of clay interstratified with beds of imperfect lignites. Pengelly and Heer have recently examined the strata of this small basin, and have found that all the plants are of Miocene age, and belong to the same species as those found in similar deposits, not only on the continent, but in Iceland, Greenland, and Arctic America. Their *facies* indicates a warmer climate than the present, and the geographical range of the species is unexampled in the existing flora. The Mull beds are situated at the headland of Ardun, and consist of interstratified basalts, ashes, and lignites. They are three leaf-beds, varying in thickness from  $1\frac{1}{2}$  to  $2\frac{1}{2}$  feet, separated by two beds of ash, the whole resting on, and covered by strata of basalt. The whole thickness is 131 feet. It is supposed that the leaf-beds were deposited in a shallow lake or marsh, in the vicinity of an active volcano. One of the beds consists of a mass of compressed leaves without stems, and accompanied with abundant remains of an equisetum, which grew in the marsh into which the leaves were blown. The leaves belong to dicotyledonous and coniferæ, and are of species similar to those of Bovey Tracey.

The Fabians of France are of this age, as are also part of the Mollasse of Switzerland, and the Mayence and Vienna basins. Of the same period are the highly fossiliferous deposits in the Sewalik Hills, India, containing the remains of several elephants, a mammoth, hippopotamus, giraffe, and large ostrich, besides several carnivora, monkeys, and crocodiles, and a large tortoise, whose shell measured 20 feet across. The European beds contain the remains of the Dinotherium (q. v.).

MIRABEAU, Honoré Gabriel Riquetti, Comte de, was born 9th March 1749, at Bignon, near Nemours. He was descended, by his own account, from the ancient Florentine family of Arrighetti, who being expelled from their native city in 1263, on account of Ghibelline politics, settled in Provence. Jean de Riquetti or Arrighetti purchased the estate of Mirabeau in 1562; his grandson, Thomas, happened to entertain here, in 1660, Louis XIV. and Cardinal Mazarin, on which occasion he received from the monarch the title of Marquis Victor Riquetti. Marquis de Mirabeau (born 1715, died 1789), the father of Honoré, was a vain and foolish man, wasted his patrimony, wrote books of philanthropy and philosophy, as "*L'Ami des Hommes*" (5 vols. Par. 1755), and was a cruel tyrant in his own house. He procured no fewer than fifty-four *lettres de cachet* at different times against his wife and his children. Honoré, his eldest son, was endowed with an athletic frame and extraordinary mental abilities, but was of a fiery temper, and disposed to every kind of excess. He became a lieutenant in a cavalry regiment; but continued to prosecute various branches of study with great eagerness, whilst outrunning his companions in a career of vice. An intrigue with the youthful wife of an aged marquis brought him into danger, and he fled with her to Switzerland, and thence to Holland, where he subsisted by his pen, amongst other productions of which, his "*Essai sur le Despotisme*" attracted great attention. Meanwhile, sentence of death was pronounced against him; and the French minister, at his father's instigation, demanding that he should be delivered up to justice, he and his paramour were apprehended at Amsterdam, and he was brought to the dungeon at Vincennes, and there closely imprisoned for 42 months. During this time he was often in great want, but employed himself in literary labors, writing an "*Essai sur les Lettres de Cachet et les Prisons d'état*," which was published at Hamburg (2 vols. 1782), and a number of obscene tales, by which he disgraced his genius, although their sale supplied his necessities. After his liberation from prison, he subsisted chiefly by literary labor, and still led a very profligate life. He wrote many effective political pamphlets, particularly against the financial administration of Calonne, receiving pecuniary assistance. It was said, from some of the great bankers of Paris; and became one of the leaders of the Liberal party. When the States-general were convened, he sought to be elected as a representative of the nobles of Provence, but was rejected by them on the ground of his want of property; and left them with the threat that, like Marius, he would overthrow the aristocracy. He purchased a draper's shop, offered himself as a candidate to the Third Estate, and was enthusiastically returned both at Aix and Marseille. He chose to represent Marseille, and by his talents and admirable oratorical powers soon acquired great influence in the States-general and National Assembly. Barnave well characterised him as "the Shakespeare of eloquence." He stood forth as the opponent of the court and of the

aristocracy, but regarded the country as by no means ripe for the extreme changes proposed by political theorists, and labored, not for the overthrow of the monarchy, but for the abolition of despotism, and the establishment of a constitutional throne. To suppress insurrection, he effected, on 8th July 1789, the institution of the National Guard. In some of the contests which followed, he sacrificed his popularity to maintain the throne. The more that anarchy and revolutionary frenzy prevailed, the more decided did he become in his resistance to their progress; but it was not easy to maintain the cause of constitutional liberty at once against the supporters of the ancient despotism and the extreme revolutionists. The king and his friends were long unwilling to enter into any relations with one so disreputable, but at last, under the pressure of necessity, it was resolved that M. should be invited to become minister. No sooner was this known, than a combination of the most opposite parties, by a decree of 7th November 1789, forbade the appointment of a deputy as minister. From this time forth, M. strove in vain in favor of the most indispensable prerogatives of the crown, and in so doing exposed himself to popular indignation. He still continued the struggle, however, with wonderful ability, and sought to reconcile the court and the Revolution. In December 1790, he was elected president of the Club of the Jacobins, and in February 1791, of the National Assembly. Both in the Club and in the Assembly, he displayed great boldness and energy; but soon after his appointment as president of the latter, he sank into a state of bodily and mental weakness, consequent upon his great exertions and his continued debaucheries, and died 2d April 1791. He was interred with great pomp in the church of Saint Genevieve, the "Panthéon;" but his body was afterwards removed, to make room for that of Marat. A complete edition of his works was published at Paris in 9 vols. in 1826—1827. His natural son, Lucas Montigny, published "*Mémoires Biographiques, Littéraires et Politiques de Mirabeau*" (2d edit. 8 vols. Par. 1841), the most complete account which we have of his life. See also Carlyle's sketch of Mirabeau in his "*Miscellaneous Essays*," and his "*French Revolution*."

MIRACLE, a term commonly applied to certain marvellous works (healing the sick, raising the dead, changing of water into wine, &c.) ascribed in the Bible to some of the ancient prophets, and to Jesus Christ, and one or two of his followers. It signifies simply that which is wonderful—a thing or a deed to be wondered at, being derived directly from the Latin *miraculum*, a thing unusual—an object of wonder or surprise. The same meaning is the governing idea in the term applied in the New Testament to the Christian miracles, *teras*, a marvel; a portent; besides which, we also find them designated *dynamis*, powers, with a reference to the power residing in the miracle-worker; and *semeia*, signs, with a reference to the character and pretensions of which they were assumed to be the witnesses or guarantees. Under these different names, the one fact recognised is a deed done by a man, and acknowledged by the common judgment of men to exceed man's ordinary powers; in other words, a deed *supernatural*, above or beyond the common powers of nature, as these are understood by men.

In the older speculations on the subject, a miracle was generally defined to be a violation or suspension of the order of nature. While, on the one hand, it was argued (as by Hume), that such a violation or suspension was absolutely impossible and incredible; it was maintained, on the other, that the Almighty, either by his own immediate agency, or by the agency of others, could interfere with the operation of the laws of nature, in order to secure certain ends, which, without that interference, could not have been secured, and that there was nothing incredible in the idea of a law being suspended by the Person by whom it had been made. The laws of nature and the will or providence of God were, in this view, thus placed in a certain aspect of opposition to each other, at points here and there clashing, and the stronger arbitrarily asserting its superiority. Such a view has, with the advance of philosophical opinion, appeared to many to be inadequate as a theory, and to give an unworthy conception of the Divine character. The great principle of Law, as the highest conception not only of nature, but of Divine Providence, in all its manifestations, has asserted itself more dominantly in the realm of thought, and led to the rejection of the apparently conflicting idea of "interference," implied in the old notion of miracle. Order in nature, and a just and uncapricious will in God, were felt to be first and absolutely necessary principles. The idea of miracle, accordingly, which

Miracle  
Mirfield

122

seems to be now most readily accepted by the advocates of the Christian religion, has its root in this recognised necessity.

All law is regarded as the expression, not of a lifeless force, but of a perfectly wise and just will. All law must develop itself through natural phenomena; but it is not identified with or bound down to any necessary series of these. If we admit the mainspring of the universe to be a living will, then we may admit that the phenomena through which that will, acting in the form of law, expresses itself, may vary without the will varying or the law being broken. We know absolutely nothing of the mode of operation in any recorded miracle; we only see certain results. To affirm that these results are either impossible in themselves, or necessarily violations of natural law, is to pronounce a judgment on imperfect data. We can only say that, under an impulse which we must believe proceeds from the Divine will, in which all law exists, the phenomena which we have been accustomed to expect have not followed on their ordinary conditions. But from our point of view we cannot affirm that the question as to *how* this happens is one of interference or violation; it is rather, probably, one of higher and lower action. The miracle may be but the expression of one Divine order and beneficent will in a new shape—the law of a greater freedom, to use the words of Treuch, swallowing up the law of a lesser.

Nature being but the plastic medium through which God's will is ever manifested to us, and the design of that will being, as it necessarily must be, the good of his creatures, that theory of miracle is certainly most rational which does not represent the ideas of laws and of the will of God as separate and opposing forces, but which represents the Divine will as working out its highest moral ends, not against, but through law and order, and evolving from these a new issue, when it has a special beneficent purpose to serve. And thus, too, we are enabled to see in miracle not only a wonder and a power, but a sign—a revelation of Divine character, never arbitrary, always generous and loving, the character of one who seeks through all the ordinary courses of nature and operation of law to further His creatures' good, and whose will, when that end is to be served, is not restricted to any one necessary mode or order of expression. Rightly interpreted, miracle is not the mere assertion of power, or a mere device to impress an impressible mind; it is the revelation of a will which, while leaving nature as a whole to its established course, can yet witness to itself as above nature, when, by doing so, it can help man's moral and spiritual being to grow into a higher perfection.

The evidence for the Christian miracles is of a twofold kind—external and internal. As alleged facts, they are supposed to rest upon competent testimony, the testimony of eye-witnesses, who were neither deceived themselves, nor had any motive to deceive others. They occurred not in privacy, like the alleged supernatural visions of Mohammed, but for the most part in the open light of day, amidst the professed enemies of Christ. They were not isolated facts, nor wrought tentatively, or with difficulty; but the repeated, the overflowing expression, as it were, of an apparently supernatural life. It seems impossible to conceive, therefore, that the apostles could have been deceived as to their character. They had all the means of scrutinising and forming a judgment regarding them that they could well have possessed; and if not deceived themselves, they were certainly not deceivers. There is no historical criticism that would now maintain such a theory; even the most positive unbelief has rejected it. The career of the apostles forms throughout an irrefragable proof of the deep-hearted and incorruptible sincerity that animated them. The gospel miracles, moreover, are supposed in themselves to be of an obviously Divine character. They are, in the main, miracles of healing, of beneficence, in which the light equally of the Divine majesty and of the Divine love shines—witnessing to the eternal life which underlies all the manifestations of decay, and all the traces of sorrow in the lower world, and lifting the mind directly to the contemplation of his life.

MIRACLE PLAYS. See MYSTERIES.

MIRA'GE, a phenomenon extremely common in certain localities, and as simple in its origin as astonishing in its effects. Under it are classed the appearance of distant objects as double, or as if suspended in the air, erect or inverted, &c. One cause of mirage is a diminution of the density of the air near the surface of the

earth, produced by the transmission of heat from the earth, or in some other way; the denser stratum being thus placed *above*, instead of, as is usually the case, *below* the rarer. Now, rays of light from a distant object, situated in the denser medium (i. e. a little above the earth's level), coming in a direction nearly parallel to the earth's surface, meet the rarer medium at a very obtuse angle, and (see REFRACTION) instead of passing into it, are reflected back to the dense medium; the common surface of the two media acting as a mirror. Suppose, then, a spectator to be situated on an eminence, and looking at an object situated like himself in the denser stratum of air, he will see the object by means of directly transmitted rays; but besides this, rays from the object will be reflected from the upper surface of the rarer stratum of air beneath to his eye. The image produced by the reflected rays will appear inverted, and below the real object, just as an image reflected in water appears when observed from a distance. If the object is a cloud or portion of sky, it will appear by the reflected rays as lying on the surface of the earth, and bearing a strong resemblance to a sheet of water; also, as the reflecting surface is irregular, and constantly varies its position, owing to the constant communication of heat to the upper stratum, the reflected image will be constantly varying, and will present the appearance of a water surface ruffled by the wind. This form of mirage, which even experienced travellers have found to be completely deceptive, is of common occurrence in the arid deserts of Lower Egypt, Persia, Tartary, &c.

In particular states of the atmosphere, reflection of a portion only of the rays takes place at the surface of the dense medium, and thus double images are formed, one by reflection, and the other by refraction—the first inverted, and the second erect. The phenomena of mirage are frequently much more strange and complicated, the images being often much distorted and magnified, and in some instances occurring at a considerable distance from the object, as in the case of a tower or church seen over the sea, or a vessel over dry land, &c. The particular form of mirage known as *looming*, is very frequently observed at sea, and consists in an excessive apparent elevation of the object. A most remarkable case of this sort occurred on the 26th of July 1798, at Hastings. From this place the French coast is fifty miles distant; yet, from the sea-side the whole coast of France from Calais to near Dieppe was distinctly visible, and continued so for three hours. In the Arctic regions it is no uncommon occurrence for whale-fishers to discover the proximity of other ships by means of their images seen elevated in the air, though the ships themselves may be below the horizon. Generally, when the ship is above the horizon, only one image, and that inverted, is found; but when it is wholly or in great part below the horizon, double images, one erect and the other inverted, are frequently seen. The faithfulness and distinctness of these images at times may be imagined from the fact, that Captain Scoresby, while cruising off the coast of Greenland in 1822, discovered the propinquity of his father's ship from its inverted image in the sky. Another remarkable instance of M. occurred in May 1854, when, from the deck of H. M. screw-steamer, *Archer*, then cruising off Oesel, in the Baltic, the whole English fleet of nineteen sail, then nearly thirty miles distant, was seen as if suspended in the air upside down. Beside such phenomena as these, the celebrated *Fata Morgana* (q. v.) of the Straits of Messina sinks into insignificance. The *Spectre of the Brocken*, in Hanover, is another celebrated instance of mirage. Its varieties are indeed numberless, and we refer those who wish for further information to Brewster's "Optics," Biot's "Traité de Physique," and for the mathematical theory of the mirage to the works of Biot, Monge, and Wollaston. See also REFLECTION and REFRACTION.

**MIRANDOLA**, a town of Northern Italy, in the province of Modena, and 20 miles north-north-east of the city of that name. It stands in the midst of a low-lying and somewhat unhealthy flat, and contains numerous churches, a cathedral, and a citadel. Rice is much cultivated in the vicinity, and the breeding of silk-worms is an important branch of industry. Pop. of town (1871), 3059; of commune, 13,170.

**MIRECOURT**, a town of France in the department of Vosges, in a picturesque district, 20 miles south of Nancy. It is famous for its manufactures of lace, and of church-organs and stringed musical instruments. Pop. (1876) 5162.

**MIRFIELD**, a manufacturing village of the West Riding of Yorkshire, England, three miles east of Dewsbury. The manufactures are fancy and other woollen

**Mirpur**  
**Mishmee**

124

fabrics, and cotton goods. It is one of the chief railway centres in the country. Pop. (1871) 12,869.

**MIRPU'R**, a flourishing town of India, in Sind, on the left bank of the Pinari, 45 miles south of Hyderabad. It contains a fort capable of accommodating 200 men, and which commands the route from Hyderabad to Cutch. The surrounding district is fertile and well cultivated. Pop. 3000.

**MIRROR**, a reflecting surface, usually made of glass, lined at the back with a brilliant metal, so as strongly to reflect the image of any object placed before it. When mirrors were invented, is not known, but the use of a reflecting surface would become apparent to the first person who saw his own image reflected from water; and probably for ages after the civilisation of man commenced, the still waters of ponds and lakes were the only mirrors; but we read in the Pentateuch of mirrors of brass being used by the Hebrews. Mirrors of bronze were in very common use amongst the ancient Egyptians, Greeks, and Romans, of which many specimens are preserved in museums. Praxiteles taught the use of silver in the manufacture of mirrors in the year 328 B.C. Mirrors of glass were first made at Venice in 1300; and judging from those still in existence—of which one may be seen at Holyrood Palace, in the apartments of Queen Mary—they were very rude contrivances, compared with modern ones. It was not until 1678 that the making of mirrors was introduced into England. It is now a very important manufacture; and mirrors can be produced of any size to which plate-glass can be cast. After the plate of glass is polished on both sides, it is laid on a perfectly level table of great strength and solidity, usually of smooth stone, made like a billiard-table with raised edges; a sheet or sheets of tinfoil sufficient to cover the upper surface of the glass are then put on, and rubbed down smooth, after which the whole is covered with quicksilver, which immediately forms an amalgam with the tin. The superfluous mercury is then run off, and a woollen cloth is spread over the whole surface, and square iron weights are applied. After this pressure has been continued a day and night, the weights and the cloth are removed, and the glass is removed to another table of wood, with a movable top, which admits of gradually increasing inclination until the unamalgamated quicksilver has perfectly drained away, and only the surface of perfect amalgam remains coating the glass, and perfectly adherent to it.

Heat is reflected like light; so that a concave M. may be used to bring rays of heat to a focus. In this way combustible substances may be set on fire at a distance from the reflector whence they receive their heat. Thus used, a M. is called a *Burning M.*

**MIRTA**, a town of India, in the Rajpoot state of Jodhpur, stands on high ground near the source of a tributary of the Luni, 230 miles south-west of Delhi. M. is supplied with good water from three large tanks. Pop. estimated at 25,950.

**MIRZA**, a contraction of *Emir Zadah*, "son of the prince," is, when prefixed to the surname of the individual, the common title of honor among the Persians; but when annexed to the surname, it designates a prince or a male of the blood-royal.

**MIRZAPUR**, a town of British India, capital of the district of the same name on the right bank of the Ganges, which is here half a mile wide, and crossed by a ferry, 40 miles south-west of Benares. It has some manufactures of carpets, cottons, and silks, and is the greatest cotton-mart in India. Pop. (1872) 67,274. The district of M., in the North-west Provinces, is watered by the Ganges and the Son. Lat. 23° 50'—25° 30' N.; long. 82° 11'—83° 39' E. Area, 5285 square miles. Pop. (1872) almost all Hindus, 1,054,413. The chief productions, beside the usual cereals, are cotton, indigo, and sugar. The climate is, on the whole, unhealthy for Europeans.

**MISDEMEANOR** is one of the technical divisions of crimes, by the law of England and Ireland. The usual division of crimes is into treason (which generally stands by itself, though, strictly speaking, included in), felony, and misdemeanor. The offence of greatest enormity is treason, and the least is misdemeanor. The original distinction between felony and misdemeanor consisted in the consequences of a conviction. A party convicted of felony, if capital, forfeits both his real and personal estate; if not capital, his personal estate only. A party convicted of mis-

demeanor forfeits none of his property. The distinction is not kept up between the two classes of crimes by any greater severity of punishment in felony, for many misdemeanors are punished as severely as some felonies. But it has been the practice of the legislature, when creating new offences, to say whether they are to be classed with felony or misdemeanor; and when this is done, the above incidents attach to the conviction accordingly.

**MISE'NO**, a promontory of the province of Naples, 2 miles south-west of the city of Naples. On the outskirts of the promontory are the extensive ruins of the ancient city of Misenum, including a vast church and theatre. M. is much visited on account of its wonderful grotto Draconara, and a curious subterranean building or labyrinth, called the Hundred Chambers, supposed to have been anciently employed as dungeons.

**MISERE'RE**, the name by which, in Catholic usage, the 50th Psalm of the Vulgate (51st in authorised version) is commonly known. It is one of the so-called "Penitential Psalms," and is commonly understood to have been composed by David in the depth of his remorse for the double crime which the prophet Nathan rebuked in the well-known parable (2 Sam. xii.). Another opinion, however, attributes this psalm to Manasse, or to some of the psalm-writers of the Captivity. The *Miserere* is of frequent occurrence in the services of the Roman Church; and in the celebrated service of *Tenebræ*, as performed in the Sixtine Chapel at Rome, it forms, as chanted by pope's choir, one of the most striking and impressive chants in the entire range of sacred music. It is sung on each of the three nights in Holy Week (q. v.) on which the office of *Tenebræ* is held, with different music on each of the three occasions, the three composers being Bal, Baiul, and the still more celebrated Allegri.—*Miserere* is also the name of one of the evening services in Lent, which is so called from the singing of that psalm, and which includes a sermon, commonly on the duty of sorrow for sin.

**MISERERE**, a projection on the under side of the seats of the stalls of medieval churches and chapels, &c. They are usually ornamented with carved work, and are so shaped, that when the seats-proper are folded up, they form a small seat at a higher level, sufficient to afford some support to a person resting upon it. Aged and infirm ecclesiastics were allowed to use these during long services.

**MISFEA'SANCE**, in Legal Language, means the doing of a positive wrong, in contradistinction to nonfeasance, which means a mere omission. Acts are sometimes followed with different legal consequences, according as they fall under the head of misfeasance or nonfeasance.

**MI'SHNA** (from Heb. *shana*, to learn; erroneously held to designate Repetition) comprises the body of the "Oral Law," or the juridico-political, civil, and religious code of the Jews; and forms, as such, a kind of complement to the Mosaic or Written Law, which it explains, amplifies and immutably fixes. It was not, however, the sole authority of the schools, and the masters, on which these explanations and the new ordinances to which they gave rise depended, but rather certain distinct and well-authenticated traditions, traced to Mount Sinai itself. No less were certain special letters and signs in the Written Law appealed to in some cases, as containing an indication to the special, newly issued, or fixed prohibitions or rules. See **HALACHA**. The *Mishna* (to which the *Toseftas* and *Boraithas* form supplements) was finally redacted, after some earlier incomplete collections, by Jehudah Hanassal, in 220 A.D., at Tiberias. It is mostly written in pure Hebrew, and is divided into six portions (*Sedarim*): 1. *Zeraim* (Seeds), on Agriculture; 2. *Moed* (Feast), on the Sabbath, Festivals and Fasts; 3. *Nashim* (Women), on Marriage, Divorce, &c. (embracing also the laws on the Nazirship and Vows); 4. *Nezikin* (Damages), chiefly civil and penal law (also containing the ethical treatise *Aboth*); 5. *Kodashim* (Sacred Things), Sacrifices, &c.; description of the Temple of Jerusalem, &c.; 6. *Tehoroth* (Purifications), on pure and impure things and persons. See also **TALMUD**.

**MI'SHMER BITTER**, the root of *Coptis Teeta* (see **COPTIS**), a plant found in the mountainous regions on the borders of India and China; of the same genus with the Golden Thread of the northern parts of the world, and not unlike it. The root is in much use and esteem in some parts of the East as a

stomachic and tonic, and has begun to be known in Europe.—The root of *C. trifoliata* is also used as a bitter.

**MISILME'RI** (corrupted from *Menzil-al-Amir*, Village of the Emire), a town of the island of Sicily, in the province of Palermo, 7 miles south-east of Palermo city. It is a straggling, poverty-stricken town. It was at M. that Garibaldi, in May 1860, joined the Sicilian insurgents; and it was by a short cut from M. to Palermo, through the Pass of Mezzaguna, that he advanced on the latter city and took it by a *coup de main*. M. used to be a notorious harbor of banditti. Pop. 7250.

**MISKÓLCZ**, the principal town in the county of Borsod, Hungary, situated at the extremity of a beautiful valley, 25 miles north-east of Erlau. It is connected with Debreczin by railway, and contains numerous churches, two gymnasia, and other educational institutions. Wine and melons are extensively cultivated. From the iron obtained in the vicinity, the best steel in Hungary is made. The chief trade is in wine. Pop. (1870) 21,119.

**MISNO'MER** is the giving of a wrong name to a party in a suit. Formerly, the objection of misnomer was of some importance, but now is of none, as it is easily cured by amendment.

**MISPRI'SION** is, in English Law, a clerical error made in drawing up a record of a court of law.

**MISREPRESENTATION**, in point of law, or, as it is most frequently termed, fraudulent misrepresentation, is that kind of lie for which courts of law will give redress. It consists in a wilful falsehood as to some material thing connected or not with some contract; the object being that the party deceived should act upon it as true. The legal result is, that if the party so relying on its truth and acting on it suffer damage, he can sue the deceiver for such damage. It has sometimes been supposed that the deceit or misrepresentation must have reference to some contract, or arise out of some confidential relation between the parties, and that the party making it should have some private interest to serve; but this is a mistake; and recent cases have established, that if a person wilfully—i. e., either not knowing anything at all one way or the other about the matter, or knowing the real truth, misrepresent something, with the intention that a stranger should act on such misrepresentation, and such stranger does so act on it, and suffer damage, then the right of action accrues to the deceived party. One remarkable exception to this doctrine, however, occurs in the case of the contract of marriage, where either party has in general no remedy whatever against the other for misrepresentations as to his or her property, connections, &c. It is not necessary that the misrepresentation should be made in writing, in order to give rise to the action, except in cases where the party gives representations as to the conduct, credit, ability, trade, or dealings of a third party, in order that such third party shall obtain credit, money, or goods thereby. The doctrine of misrepresentation has acquired great consequence of late, owing to the extension of the system of joint-stock companies, and the practice of the directors and officers publishing, or being parties to fraudulent reports, accounts, and circulars as to the credit and stability of such undertakings. It is now settled, that not only every director, but every clerk in the service of the directors, who knowingly and wilfully concurs and takes a part in publishing or circulating such false reports, whereby strangers are led to believe and act on them, and thereby suffer pecuniary loss, is liable to an action of damages at the suit of such strangers. It is also a general rule affecting contracts (other than marriage), that misrepresentation in some material point bearing on the contract, and likely to induce the party to enter into such contract, will render the contract void; but in order to make a trifling misrepresentation have the same effect, the party must warrant such representation to be true; in which case, whether trifling or not, or whether wilful or not, a misrepresentation avoids the contract; and this is generally the case in contracts of life and fire insurance. Against such a practice, Lord St Leonards lately remonstrated, as one involving great hardship to the class of insurers, who, after paying premiums for years, find at last their security gone. Another class of fraudulent misrepresentations, of great consequence, and now brought within the

criminal law to a large extent, is that of counterfeiting trade-marks, as to which, see **TRADE-MARKS**.

**MISSA DI VOCE**, a term used in the art of singing, meaning the gradual swelling and again diminishing of the sound of the voice on a note of long duration.

**MISSAL**, the volume containing the prayers used in the celebration of the Mass. Anciently, considerable variety in minor details prevailed among the books in use in different countries, and even in different churches of the same country. With the view of restoring uniformity, the pope, in virtue of a decree of the Council of Trent, in 1570, ordered that all churches which had not, for a clearly ascertained period of 200 years, enjoyed an uninterrupted use of a peculiar service-book of their own, should thenceforth adopt the Roman Missal. Of this exemption, several churches in Germany, France, and even in Italy, availed themselves; but in later times, the great majority have conformed to the Roman use. The Roman Missal has twice since that date been subjected to revision and correction—in 1604 by Clement VIII., and in 1634 by Urban VIII. The latter recension still continues in use. The missals of the oriental rites differ from that of the Roman Church, each having for the most part its own proper form. See **LITURGY**.

**MISSIONS**, enterprises of the Christian Church for the conversion of the nations to Christianity, by sending to them teachers called *missionaries*.

The first Christians displayed great zeal in preaching the gospel to the heathen; Christian teachers continued to go forth for this purpose into heathen countries until about the 9th c., and although other and less worthy means were too often employed, the labors of Palladius in Ireland, of Columba in Scotland, of Augustine in England, of Gallus and Emmeran in Alemannia, of Killan in Bavaria, of Willibrod in Franconia, of Swidvrit in Friesland, of Siegfried in Sweden, of Boniface in Thuringia and Saxony, of Adalbert in Prussia, of Cyril and Methodius amongst the Slavonians, and of many such early missionaries, were unquestionably very instrumental in the extension of Christianity in Europe. After the Reformation, the Roman Catholic Church, roused to activity by its losses and dangers, not only sent forth missionaries to confirm its adherents in Protestant countries, and to win back Protestants, but also sought to repair its losses by new acquisitions from the vast domain of heathenism. With this view, the "Congregatio de Propaganda Fide" was constituted by Gregory XV. in 1622, and the "Collegium de Propaganda Fide" (see **PROPAGANDA**) by Urban VIII. in 1627, and in a number of places, institutions, called *seminaries*, were established for the training of missionaries. Jesuit missionaries earnestly prosecuted their work amongst the Indians of South America, from the middle of the 16th c. to the middle of the 18th, when they were expelled by the Portuguese and Spanish governments, because their political power had become too formidable. They are accused of administering baptism with too great readiness; but they were certainly successful in extending civilisation amongst the Indians, particularly of Paraguay. Jesuit missions to India and Japan were founded by Francis Xavier (q. v.) in the middle of the 16th century. In Japan, the missionaries made great progress at first; and in 1582 they boasted of 150,000 converts, 200 churches, and 59 religious houses of their order in that empire; but ere the middle of the 16th c., the whole work had been overthrown, and every missionary expelled. In China, similar rapid success was enjoyed, and was followed by a similar period of persecution, although the destruction effected was more partial than in Japan, and the Church of Rome continued to subsist in China, its missionaries and members enduring great hardships, and many of them evincing their sincerity even by their death. There are not a few Roman Catholics in China at the present time. In Abyssinia also, the Jesuits made great progress in the 17th century, and for a time attained great power in the country; but their interference in political matters led to their complete expulsion. In the 17th c., the Jesuits boasted of the vast success of their mission in Madura, a province of Southern India; but it was found to be rather apparent than real, and to have been attained by a compromise of Christianity and the employment of unworthy means, so that, after long contests in the papal court, a decision was pro-

nounced against the Jesuits, and their connection with Madura was dissolved in the middle of the 18th century.

For a long period after the Reformation, the Protestant Church seems to have been little sensible of the duty of laboring for the propagation of Christianity; nor was it until the present century that missionary zeal began to be largely developed. In the middle of the 17th c. (1647), indeed, an act of the English parliament established the *Society for Propagating the Gospel in Foreign Parts*, and at the close of the century (1693), the *Society for Promoting Christian Knowledge* was established. A few missionaries labored with zeal and success among the North American Indians, in which field the names of Elliot and Mayhew are particularly distinguished in the 17th c., and that of Brainerd in the 18th; but the commencement of more systematic and continuous missionary enterprise may be reckoned from the establishment of the first Protestant mission to India, which did not take place till the beginning of the 18th c., when Bartholomew Ziegenbalg and another were sent thither by Frederick IV. of Denmark, and settled in a small territory then belonging to Denmark on the coast of Coromandel. The mission in the south of India soon received the support of the English *Society for Promoting Christian Knowledge*, and was maintained and extended chiefly by that Society during the whole of the 18th century. Amongst the missionaries who labored in this field, the name of Swartz is particularly distinguished; and the success which attended his exertions, and the influence which he acquired in the country, were equally remarkable. He died in 1793. Since that time, the missionary work in the south of India has been carried on with continued success, and by the missionaries of a number of societies. Greater progress has been made there than in any other part of India, nor, indeed, was the work commenced in any other part of India till almost a century later.—The Moravian Church early entered upon missionary enterprise, and was the first Protestant Church which did so in its united or corporate character; and very successful missions of the United Brethren were planted in the 18th c. at the Cape of Good Hope, in the West Indies, and in Labrador. Greenland had previously been made the field of similar enterprise by missionaries from Norway. The mission to Greenland was founded by Hans Egede (q.v.), in 1721, and has been maintained to the present day. Its success has been such, that the greater portion of the Greenlanders have now been converted to Christianity, and much of the rudeness of their former manner of life has disappeared.—Towards the close of the 18th c., some of the great missionary societies still existing in England were formed—the *Baptist Missionary Society* in 1792, the *London Missionary Society* in 1795. About the same time, the *British and Foreign Bible Society*, and the *Religious Tract Society*, were formed, which have co-operated with all the missionary societies as most important auxiliaries. The *Baptist Missionary Society*, immediately after its formation, sent missionaries to the north of India. Dr Carey was one of its first, and also one of its most eminent missionaries. India is now a field of labor for many missionary societies, not only of Britain, but also of America and of the continent of Europe. The *London Missionary Society* sent its first missionaries to the South Sea Islands, and the mission was maintained for about 16 years, amidst many difficulties, without any apparent success; but its success was afterwards great and rapid, first in Tahiti, and afterwards in other islands, so that now many of the islands of the South Seas are entirely Christian. The *London Missionary Society* soon entered also upon other fields of labor, and now maintains missions to many parts of the world. It was at first composed of members of almost all Protestant denominations; but the formation of other societies, and the engagement of churches as such in missionary enterprise—as the Wesleyan Methodist Church—have left this society now in a great measure to the English Independents. One of the most important societies founded during the present century, the *Church Missionary Society*, formed by members of the Church of England, has sent forth missionaries to many fields. They have been particularly successful in New Zealand, the west of Africa, and about Hudson's Bay; and they recently entered Abyssinia. The various churches in Scotland also support vigorous mission agencies. The late Dr Livingstone, of the *London Missionary Society*, explored vast regions in Central Africa. Fired by his example, the friends of missions in Scotland subscribed £12,000 to found *Livingstonia*, a memorial mission station on Lake Nyassa, under the management of the

Free Church Foreign Missions Committee; and an expedition arrived there and established itself in 1876. Various other missionary societies, Catholic and Protestant, have selected stations in the region of the great lakes. The Wesleyan Methodists have missions in many parts of the world. They have been particularly successful in the Fiji Islands, and in parts of the west of Africa.—The *American Board of Commissioners for Foreign Missions* was formed in 1810, and was soon followed by other missionary societies in America, some of which rival those of Britain in magnitude and importance. One of the first enterprises of the American Board was the mission to the Sandwich Islands, founded in 1819, which has resulted in the general Christianisation of these islands, and in their civilisation to a degree which, considering the shortness of the time, may well be regarded with admiration. The *American Baptist Missionary Society* has occupied Burmah and the Eastern Peninsula as one of its principal spheres of labor, and there its missionaries have enjoyed remarkable success in the Christianisation and civilisation of the people called Karens. Protestant missionary societies have also been formed on the continent of Europe, of which the first was that of Basel, in 1816, and the next was that of Berlin, in 1828; and some of these have also maintained successful missions in heathen countries. The instances of most marked and extensive success of missions are those which have been already noticed, and that of Madagascar, where missionaries of the London Missionary Society enjoyed the protection and favor of King Radama I., and the church planted by them continued to exist, notwithstanding severe persecution, and the martyrdom of not a few of its members, during the next reign, and is a wonderfully flourishing church at the present day. In the south of Africa, also, important results have been attained. Access has recently been obtained to China, and a number of Protestant churches and societies have entered energetically upon that field. Preparation had been previously made for this, by missionary labors amongst the Chinese in the Eastern Peninsula, and by the study of the language, the compilation of grammars and dictionaries, and the translation of the Bible into the Chinese language. Indeed, it must be reckoned as among the services rendered to mankind by Christian missionaries in modern times, that they have not only translated the Bible and other religious books into many languages, but have reduced many barbarous tongues to writing, and have prepared grammars and dictionaries, thereby contributing not a little, independently of their highest aim, to the promotion of knowledge, civilisation, and the welfare of the human race.

The progress of Christian missions to Mohammedan countries has hitherto been very small, although numerous converts from Mohammedanism, as well as from heathenism, have been made in India. Of late, some have thought they observed a movement among the Mohammedans of India, apparently tending towards Christianity; but at the same time there has been a new awakening of Mohammedanism itself in the Eastern Peninsula and the islands of the Malay Archipelago. Missions to the Jews have for several years engaged not a little of the attention of some portions of the Christian Church, particularly in England and Scotland. Missions have been planted in places where Jews are numerous, and already with considerable success.

**MISSISSIPPI**, one of the south-western United States of America, lies in lat.  $30^{\circ} 13' - 36^{\circ}$  n., and long.  $89^{\circ} 7' - 91^{\circ} 41'$  w. It is 832 miles from north to south, and from 78 to 118 miles from east to west, containing an area of 47,156 square miles. It is bounded n. by Tennessee, e. by Alabama, s. by the Gulf of Mexico and East Louisiana, and w. by the rivers Pearl and Mississippi. The state also includes a cluster of islands in the Gulf, of which the principal are Horn, Deer, and Ship Islands. There are 73 counties. The principal towns are Jackson (the capital), Natchez, Vicksburg, and Columbus. There are 88 miles of sea-coast, but no good harbors. The surface is undulating, and generally very fertile, with river-bottoms of great productiveness. The sea-coast is sandy, but well timbered with live oak, magnolia, and pine, and is considered one of the most healthy districts in the world. The state borders for 500 miles on the Mississippi, and is drained by its tributaries, the Yazoo, Black, Sunflower, &c., and by the Pearl and Pascagoula, flowing into the Gulf of Mexico. The country is of the Tertiary and Upper Secondary formations, with great alluvial valleys; the climate semi-tropical; the chief productions, cotton, sugar, maize, wheat, sweet potatoes, peaches, figs, oranges, &c. In its forests are found the deer, puma, bear, wolf, wild-cat, paroquets, wild turkeys, and pi-

geons, with fish and alligators in the rivers. The state is well provided with railways, and has immense wealth and resources. In 1870, with a population of 1,131,597, it produced 963,111 lbs. of cotton, and 21,340,800 bushels of Indian corn. In 1874, there were 1 university, 4 colleges, an agricultural college, an institution for deaf-mutes and the blind, also a lunatic asylum. This region was traversed by De Soto in 1542. La Salle descended the Mississippi in 1682, and claimed the country for France; in 1698, M. d'Iberville formed settlements on the coast at Ship Island and Biloxi. Natchez was settled in 1700; but in 1728 this settlement was destroyed by the Natchez tribe of Indians, who were afterwards defeated, and the survivors sold into slavery in St Domingo. M. was admitted to the Union in 1817; it seceded in 1861, and joined the Southern Confederacy. In 1869, M. agreed to the new constitution, and was restored to its place in the Union. In 1863, the city of Vicksburg, after a long and gallant defence, was forced, by famine, to surrender to General Grant; and Jackson, the capital, was taken, and partially destroyed by the Federals, and some of the finest regions of the state laid waste.

MISSISSIPPI (Indian, *Miche Sepe*, Great River, literally, Father of Waters), a river of the United States of America, the principal river of North America, and, including its chief branch, the Missouri, the longest in the world, rises in the highlands of Minnesota, in a cluster of small lakes, and near the sources of the Red River of the North, and the rivers which flow into Lake Superior, in lat.  $47^{\circ}10'$  n., long.  $94^{\circ}54'$  w. Its sources are 1680 feet above the Gulf of Mexico, into which it enters. Its general course is southerly, with numerous windings, giving it a length of 2986 miles to its mouth, in lat.  $29^{\circ}$  n., long.  $90^{\circ}$  w., from which, to the source of the Missouri, is 4506 miles. The M. and its branches drain an area of 1,326,000 square miles. It is navigable to the Falls of St Anthony, 2200 miles, and by smaller boats above the falls; or by the Missouri, 3950 miles, and has 1500 navigable branches, the chief of which are the Red River, 340 miles from its mouth; the Yazoo, 534 miles; the Arkansas, 700 miles; the Ohio, 1053 miles; the Missouri, 1263 miles. The M. River forms a portion of the boundaries of ten states, having the southern part of Minnesota, Iowa, Missouri, Arkansas, and most of Louisiana on the west bank; and Wisconsin, Illinois, Kentucky, Tennessee, and Mississippi on the east. The chief towns situated on its banks are New Orleans, Natchez, Vicksburg, Memphis, St Louis, Quincy, Keokuk, Galena, St Paul. The Upper M., above the junction of the Missouri, flows through a picturesque and beautiful country. The great lower valley is 500 miles long, and from 80 to 60 wide. The delta, through which flow its numerous bayous, is 150 miles wide. The alluvial plain through which the river winds has an area of 81,200 square miles; and the delta, 14,000 square miles, all of which, except a few bluffs, is protected by levees, or embankments, from frequent inundations. The descent of the plain is 320 feet, or 8 inches per mile. The river, at high water, is higher than the plain, and the banks higher than the swamps of the interior. The great floods rise 40 feet above low water at the head of the plain, and 20 feet at New Orleans, and for the whole distance the river averages 3000 feet wide, and is from 75 to 120 deep. There is no apparent increase from the largest branches, and it is estimated that 40 per cent. of the floods are lost in the great marshes. Thousands of acres of land upon the banks are annually carried away by the current, with their growth of timber.

MISSISSIPPI SCHEME. The gigantic commercial scheme commonly known by this name was projected in France by the celebrated John Law (q. v.) of Lanrieton, in 1717, and collapsed in 1720. Its primary object was to develop the resources of the province of Louisiana and the country bordering on the Mississippi, a tract at that time believed to abound in the precious metals. The company was incorporated in August, 1717, under the designation of the *Company of the West*, and started with a capital of 200,000 shares of 500 livres each. They obtained the exclusive privilege of trading to the Mississippi, farming the taxes, and coining money. The prospectus was so inviting, that shares were eagerly bought; and when, in 1719, the company obtained the monopoly of trading to the East Indies, China, the South Seas, and all the possessions of the French East India Company, the brilliant vision opened up to the public gaze was irresistible. The *Company of the Indies*, as it was now called, created 50,000 additional shares, but a rage for speculation had seized all classes, and there were at least 500,000 applicants for the

new shares, which consequently rose to an enormous premium. Law, as director-general, promised an annual dividend of 200 livres per share, which, as the shares were paid for in the depreciated *billets d'état*, amounted to an annual return of 120 per cent. The public enthusiasm now rose to absolute frenzy, and Law's house, and the street in front of it, were daily crowded with applicants of both sexes and of all ranks, who were content to wait for hours, nay, for days together, in order to obtain an interview with the modern Plutus. While confidence lasted, a factitious impulse was given to trade in Paris; the value of manufactures was increased fourfold, and the demand far exceeded the supply. The population is said to have been increased by hundreds of thousands, many of whom were glad to take shelter in garrets, kitchens, and stables. But the regent had meanwhile caused the paper circulation of the national bank to be increased as the M. S. stock rose in value, and many wary speculators, foreseeing a crisis, had secretly converted their paper and shares into gold, which they transmitted to England or Belgium for security. The increasing scarcity of gold and silver becoming felt, a general run was made on the bank. The M. S. stock now fell considerably, and despite sundry desperate efforts, which were attended with momentary success, to keep up its credit, it continued to fall steadily and rapidly. In February 1720, the National Bank and the Company of the Indies were amalgamated, but though this gave an upward turn to the share-market, it failed to put the public credit on a sound basis. Several useless attempts were made to mend matters; and those suspected of having more than a limited amount (fixed by a law passed at the time) of gold and silver in their possession, or of having removed it from the country, were punished with the utmost rigor. The crisis came at last. In July 1720, the bank stopped payment, and Law was compelled to flee the country. A share in the M. S. now with difficulty brought twenty-four livres. An examination into the state of the accounts of the company was ordered by government; much of the paper in circulation was cancelled; and the rest was converted into "rentes" at an enormous sacrifice.

MISSIVE, in Scotch Law, is a memorandum. See MINUTE; LETTERS.

MISSOLO'NGHI, also Mesolonghi, a small town of Greece, in the government of Etolia, on the northern shore of the Gulf of Patras, 24 miles west of Lepanto. It is chiefly memorable for the two sieges which it underwent during the war of independence in the early part of the present century. In 1822, it was invested by land and sea by the Turks, who, after a siege of two months, were compelled to withdraw. In 1826, it was again besieged by an overwhelming Ottoman force; and after ten months of resistance and suffering, its garrison, reduced from 5000 to 2000 fighting-men, cut their way through the ranks of the enemy, carrying with them a great number of the women and children. The Turks then entered the town, which was all but totally destroyed. Here Lord Byron died in 1824. Pop. about 4000.

MISSOURI, one of the United States of America, in lat. 36° 30'—40° 30' n., and long. 89° 2'—95° 52' w., being 277 miles from north to south, and from 200 to 312 miles from east to west, having an area of 67,880 square miles, or 43,123,200 acres. It is bounded n. by Iowa; e. by the Mississippi River; s. by Arkansas; and w. by Nebraska Territory, Kansas, and the Indian Territory. M. has 114 counties. Its chief towns are Jefferson City (the capital), St Louis, Kansas City, Hannibal, St Joseph, Lexington. Its chief rivers are the Mississippi, which borders the state for 470 miles; the Missouri, which forms a portion of its western boundary, and passes through it from west to east; and its affluents, the Osage, Gasconade, &c. The country south of the Missouri River is undulating, rising into mountains toward the borders of Arkansas; the northern portion of the state is level prairie-land, with rich bottoms, and high picturesque bluffs on the rivers. The geological formations range between the Lower Silurian and Upper Coal. There are porphyritic rocks in the south; in the centre, coal-measures, with veins of an aggregate thickness of 500 feet, highly bituminous, and immense deposits of iron, with lead and iron in limestone formations. The winters are long and severe, the summers hot, with sudden changes. Much of the land is very fertile, producing maize, wheat, hemp, tobacco, the peach, nectarine, grape, &c. Cotton is grown in the southern counties. A large German population has introduced wine-making. The chief manufactures are ironworks, distilleries, and breweries.

**Missouri**  
**Miyakahara**

132

St. Louis has a large trade, and the western towns supply caravans or trains to New Mexico, Utah, and California. The counties and cities have appropriated \$45,000,000 to railways, and in 1875 there were 3036 miles completed, and several hundred under construction. There are 39 universities and colleges, several medical and ecclesiastical seminaries, 8000 public schools with 370,000 pupils, and above 2000 churches. M. was formerly a part of Upper Louisiana. St. Genevieve was settled in 1753, by emigrants from Canada and Spain. St. Louis, a French trading-post, in 1775, had 800 inhabitants. The country was purchased by President Jefferson in 1803; and in 1821, after a great contest, was admitted into the Union as a slave state, under what was called the Missouri Compromise, which admitted M., but prohibited slavery north of the northern boundary of Arkansas, 36° 30' n. lat. In 1861, M. joined with the Seceded States, and became a scene of civil war and violent partisan conflicts. Pop. in 1820, 66,586; and in 1840, 383,702; in 1860, 1,182,817; in 1870, 1,716,000; in 1880, 2,168,380.

**MISSOURI** (Mud River), a river of the United States of America, and chief affluent of the Mississippi, rises in two forks, the Jefferson and Gallatin, in the Rocky Mountains, Dakota Territory, lat. 45° n., long. about 112° w. Its course is first northerly for 500 miles, then easterly 1200, then south-easterly to the mouth of the Kansas, and easterly to its junction with the Mississippi. Its length from its source to the Mississippi is 3096 miles; to the Gulf of Mexico, 4506. It is navigable at high water to the Great Falls, 2540 miles from the Mississippi. It is a turbid, rapid stream, with a vast number of tributaries, the chief of which are the Osage, the Kansas, the Platte, the Cheyenne, the Yellowstone. The Upper M. is remarkable for its scenery; at 411 miles from its source, it enters the Gates of the Rocky Mountains, a gorge of 5½ miles, between perpendicular walls 1200 feet high, and 450 feet apart. At the Great Falls, 145 miles below, the river falls 357 feet in a series of rapids and cascades, 16½ miles long. The largest fall is 87 feet, and the scenery is full of grandeur.

**MISTAKE** is a ground in law for having a contract reformed, and may be set up in some cases as a defence; but a mere mistake as to the legal effect of a deed or contract is in general not regarded as a ground for redress. When money has been paid by a mistake as to some important fact, it may be recovered back from the party to whom it was so paid by an action for money had and received; but if the mistake was made in a matter of law, it cannot be recovered back.

**MISTLETOE** (Anglo-Sax. *mistletoe*, Ger. *mistel*; the *tan* of the Anglo-Saxon name means a twig or prong, a shoot of a tree; *mistel* is cf. uncertain etymology, but probably the same, in meaning at least, as the Latin *viscus*), a genus (*Viscum*) of small parasitical shrubs of the natural order *Loranthaceae*. This order is exogenous, and contains more than 400 known species, mostly tropical and parasitic. The leaves are entire, almost nerveless, thick and fleshy, and without stipules. The flowers of many species are showy. The calyx arises from a tube or rim, which sometimes assumes the appearance of a calyx, and is so regarded by many botanists; what others deem the colored calyx being viewed by them as a corolla of 4 or 8 petals or segments. Within this are the stamens, as numerous as its divisions, and opposite to them. The ovary is one-celled, with a solitary ovule; the fruit one-seeded, generally succulent.—The only British species of this order is the Common M. (*V. album*), a native also of the greater part of Europe, growing on many kinds of trees, particularly on the apple, and others botanically allied to it, as the pear, service, and hawthorn; sometimes, also, on sycamores, limes, poplars, locust-trees, and fir, but very rarely on oaks (contrary to the common belief). It is very plentiful in some parts of the south of England, its evergreen leaves giving a peculiar appearance to the orchards in winter, when the bushes of M. are very conspicuous among the naked branches of the trees; but it is very local. It is not a native of Scotland, though found naturalised in various places. The stems are *dichotomous* (i. e., divide by forking); the leaves are opposite, of a yellowish-green color, obovate-lanceolate, obtuse. The flowers are inconspicuous, and grow in small heads at the ends and in the divisions of the branches, the male and female flowers on separate plants. The berries are about the size of currants, white, translucent, and full of a very viscid juice, which serves to attach the seeds to branches, where they take root when they germinate, the radicle always turning

towards the branch, whether on its upper or under side. The M. derives its nourishment from the living tissue of the tree on which it grows, and from which it seems to spring as if it were one of its own branches. The berries are a favorite food of thrushes. Bird-lime is made from them and from the bark. The M. was intimately connected with many of the superstitions of the ancient Germans and of the British Druids. In the northern mythology, Balder is said to have been slain with a spear of mistletoe. Among the Celts, the M. which grew on the oak was in peculiar esteem for magical virtues. Traces of the ancient regard for the M. still remain in some old English and German customs, as kissing under the M. at Christmas. The M. was at one time in high repute as a remedy for epilepsy and convulsions, but it seems to possess no decided medicinal properties.—*Loranthus Europæus*, a shrub very similar to the M., but with flowers in racemes, is plentiful in some parts of the south of Europe, and very frequently grows on oaks.—*L. odoratus*, a Nepalese species, has very fragrant flowers.

**MISTRAL**, *Mistraou*, or *Maestral*, the Provencal designation of the *Caurus* or *Corse* of the Romans, is a north-west wind which at certain seasons of the year prevails on the south coast of France. Its approach is heralded by a sudden change of the temperature, from the most genial warmth to piercing cold; the air is felt to be purer, and more easily inhaled, the azure of the sky is undimmed by cloud, and the stars shine by night with extraordinary and sparkling brightness; this last appearance is an infallible prognostic. The Mistral then comes in sudden gusts, struggling with the local aerial currents, but its fast increasing violence soon overcomes all opposition. In a few hours it has dried up the soil, dispersed the vapors of the atmosphere, and raised a dangerous tumult among the waters of the Mediterranean. The Mistral blows with its greatest force from the end of autumn to the beginning spring, and causes much damage to the fruit-trees in blossom, and often to the field-crops. It is a terror to the mariners of the gulfs of Lyon and Valence, and even the most hardy seaman makes all haste to a harbor of refuge. The most probable cause of the Mistral is the derangement of atmospheric equilibrium produced by the cold condensed air of the Alps and Cevennes rushing in to supply the vacuum produced by the expansion of the air in the warm southern provinces of France, and on the surface of the Mediterranean. This wind is very appropriately denominated by the Italians *Maestro*.

**MISTRETTA**, a town of the island of Sicily, 67 miles west-south-west of Messina, capital of a district. Pop. (1871) 11,218. It occupies a healthy situation near the northern coast, in the vicinity of the river Nebroden.

**MITAKSHARĀ** is the name of several commentatorial works in Sanscrit, for instance, of a commentary on the text book of the Vedānta philosophy, of a commentary on the *Mīmāṃsā* work of Kumārila, of a commentary on the *Brīhadāraṇyaka* (see *VEDA*), &c. The most renowned work, however, bearing this title is a detailed commentary by Vijnānes'wara (also called Vijnānānūtha), on the law-book of Yājñavalkya (q. v.); and its authority and influence are so great that "it is received in all the schools of Hindu law from Benares to the southern extremity of the peninsula of India as the chief groundwork of the doctrines which they follow, and as an authority from which they rarely dissent" (cf. two treatises on the Hindu Law of inheritance, translated by H. T. Colebrooke, Calcutta, 1810). Most of the other renowned law-books of recent date, such as the *Smṛiti-Chandrikā*, which prevails in the south of India, the *Chintāmanī*, *Vṛamitrodaya*, and *Mayākha*, which are authoritative severally in Mithilā, Benares, and with the *Mahrattas*, generally defer to the decisions of the M.; the *Dāyabhāga* of Jimātāvāhana alone, which is adopted by the Bengal school, differs on almost every disputed point from the M., and does not acknowledge its authority. The M., following the arrangement of its text-work, the code of Yājñavalkya, treats in its first part of duties in general; in its second, of private and administrative law; in its third, of purification, penance, devotion, and so forth; but, since it frequently quotes other legislators, expounding their texts, and contrasting them with those of Yājñavalkya, it is not merely a commentary, but supplies the place of a regular digest. The text of the M. has been edited several times in India. An excellent translation of its chapter "On Inheritance" was published by Colebrooke in the work above referred to; and its explanation of Yājñavalkya is followed by the same celebrated scholar in his "Digest

of Hindu Law" (3 vols. Calcutta and London, 1801), when translating passages from this ancient author.

MITE, a name sometimes given to the *Acarides* generally (see ACARUS); sometimes only to those of them which have the feet formed for walking, and the mouth not furnished with a sucker formed of lancet-like plates, as in the Ticks (q. v.), but with mandibles. All of them are small creatures; the species are very numerous; they feed chiefly on decaying animal and vegetable substances, or are parasitical on quadrupeds, birds, and insects. The CHEESE M. (*Acarus domesticus*, see article ACARUS) is one of the best known species; another is the FLOUR M. (*A. farinæ*), too common among flour, in both of which the body is covered with hairs very large in proportion to its size, and capable of a considerable amount of motion. The SUGAR M. (*A. saccharinus*) swarms in almost all soft sugar; but refined and crystallised sugar seems to defy its mandibles, and is free of it. The surface of jelly and preserves, when it has begun to become dry, is often covered with multitudes of very small mites. A species of M. is the cause of Itch (q. v.); and many of the lower animals are infested by parasites of this tribe. Beetles may often be seen absolutely loaded by a species which preys on them; and bird-fauclers regard with the utmost horror the RED M., which lurks in crevices of cages and aviaries, and sucks the blood, and eats the feathers of their inmates.

MITFORD, Mary Russell, a well-known English authoress, was the only child of a physician, and was born at Alresford, Hants, December 16, 1756. At the age of ten, she was sent to a boarding-school at Chelsea, and also placed under the guidance and tuition of a Miss Rowden, a lady of a literary turn, who had already educated Lady Caroline Lamb, and was destined to be the instructress of Miss Landon and of Fanny Kemble. During the five years she spent here, she read with avidity, studying the tragic authors of France, Shakspeare, and the early dramatists of England. At the age of fifteen, she returned home, and before she was twenty, she published three volumes of poetry. These having been severely castigated by the "Quarterly Review," she applied herself to writing tales and sketches for the magazines. The profession she had adopted from taste she was obliged to continue from necessity, for the spendthrift habits of her father, a good-natured but careless gentleman, had exhausted a competent fortune, and left him dependent on his daughter. The first volume of "Our Village" appeared in 1824, and the series of five volumes was completed in 1832. Of the more important of her dramatic works, "Julian" was first performed in 1823; the "Foscari" in 1826; and "Rienzi" in 1828—all of them, and especially the last, with success. Among her other important works, are "Recollections of a Literary Life" (3 vols. 1852); "Atherton" (a novel, 3 vols. 1854) and other tales; and in 1864, she also published a collected edition of her Dramatic Works, in two volumes. In 1838, she received a pension from government, but neither this nor the growing ill-health of her later years, induced her to relax her literary industry. She died at her residence, Swallowfield Cottage, near Reading, January 10, 1855.

Successful both as a compiler and an author, Miss M. has produced many interesting volumes; but her fame—if the admiring respect for an amiable lady and a woman of graceful literary genius may be so called—rests chiefly on the sketches of country life which compose "Our Village." These sketches are chiefly memorable for their style, which, if not witty, is vivacious, genial, and humorous; the outcome at once of a good heart, an active brain, and a fine fancy.

MITFORD, William, was born in London, February 10, 1744, and studied at Queen's College, Oxford, but left the university without taking his degree. In 1761, he succeeded to the family estate; and in 1769, became a captain in the South Hampshire Militia, in which capacity he made the acquaintance of Gibbon, then a major of the same, by whose advice and encouragement he was induced to undertake a history of Greece. M.'s first work, entitled "An Inquiry into the Principles of Harmony in Languages, and of the Mechanism of Verse, Modern and Ancient," appeared in 1774; but by far his most important publication was his "History of Greece," the first volume of which appeared in 1784, and the last in 1818. It is a pugnacious, opinionative, one-sided, and even fanatical production. The author is an intense hater of democracy, and can see in Philip of Macedon nothing but a great statesman, and in Demosthenes, nothing but an oratorical demagogue. Yet his zeal, which so often led him astray, also urged him, for the very purpose of sub-

stantiating his views, to search more minutely and critically than his predecessors into certain portions of Greek history, and the consequence was that M.'s work held the highest place in the opinion of scholars until the appearance of Thirlwall and Grote. He died February 8, 1827.

**MITHRAS** (cf. Sanscrit *Mitram*, friend), the highest of the twenty-eight second-class divinities of the ancient Persian Pantheon, the *Ized* (Zend. *Yazata*) or Genius of the Sun, and ruler of the universe. Protector and supporter of man in this life, he watches over his soul in the next, defending it against the impure spirits, and transferring it into the realm of eternal bliss. He is all-seeing and all-hearing, and, armed with a club—his weapon against Ahriman and the evil *Devas*—he unceasingly "runs his course" between heaven and earth. The ancient monuments represent him as a beautiful youth, dressed in Phrygian garb, kneeling upon an ox, into whose neck he plunges a knife; several minor, varying, allegorical emblems of the sun and his course, surrounding the group. At times, he is also represented as a lion, or the head of a lion. The most important of his many festivals was his birthday, celebrated on the 25th of December, the day subsequently fixed—against all evidence—as the birthday of Christ. The worship of M. early found its way into Rome, and the mysteries of M. (*Hierogasteria*, *Coracias Sacra*), which fell in the spring equinox, were famous even among the many Roman festivals. The ceremonies observed in the initiation to these mysteries—symbolical of the struggle between Ahriman and Ormuzd (the Good and the Evil)—were of the most extraordinary and to a certain degree even dangerous character. Baptism and the partaking of a mystical liquid, consisting of flour and water, to be drunk with the utterance of sacred formulas, were among the inaugural acts. The seven degrees—according to the number of the planets—were, 1. Soldiers: 2. Lions (in the case of men), or Hyenas (in that of women): 3. Ravens: 4. Degree of *Peres*: 5. of *Oromios*: 6. of *Helios*: 7. of Fathers—the highest—who were also called Eagles and Hawks. At first, of a merry character—thus the king of Persia was allowed to get drunk only on the Feast of the Mysteries—the solemnities gradually assumed a severe and rigorous aspect. From Persia, the cultus of M. and the mysteries were imported into Asia Minor, Syria, Palestine, &c., and it is not unlikely that in some parts human sacrifices were connected with this worship. Through Rome, where this worship, after many vain endeavors, was finally suppressed in 378 A.D., it may be presumed that it found its way into the west and north of Europe; and many tokens of its former existence in Germany, for instance, are still to be found, such as the M. monuments at Heddernheim, near Frankfurt-on-the-Maine, and at other places. Among the chief authorities on this subject are Anquetil da Perron, Crenzer, Silvestre de Sacy, Lajard, O. Müller (*Denkmäler d. alten Kunst*). See GUERRES, PARSES, ZENDAVESTA.

**MITHRIDATES** (more properly, **MITHRADATES**, a name formed from the Persian *Mithras*, or *Mithra*, "the sun," and an Aryan root *da*, to give; hence "sun-given" or "sun-born" prince), the name of several kings of Pontus, Armenia, Commagene, Parthia, and the Bosphorus, all of whom have sunk into insignificance, with the exception of M. VI. of Pontus, surnamed **EUPATOR** and **DIONYSUS**, but more generally known as M. **THE GREAT**. Little is known of his early career. He succeeded his father, probably about 130 B.C., while under 13 years of age, and soon after subdued the tribes who bordered on the Euxine, as far as the Chersonesus Taurica (Crimea), and after the death of Parysatis, incorporated the kingdom of the Bosphorus with his dominions. The jealous behavior of the Romans, and the promptings of his own ambitious spirit, now incited him to invade Cappadocia and Bithynia, but a wholesome fear of the power of the Great Republic induced him to restore his conquests. The *First Mithridatic War* was commenced by the king of Bithynia (88 B.C.), who, at the instigation of the Romans, invaded Pontus. M. sent an ambassador to Rome to complain of this treatment, but he was sent back with an evasive reply. M. immediately commenced hostilities, and his generals repeatedly defeated the Asiatic levies of the Romans, and he himself took possession of Bithynia, Cappadocia, Phrygia, and the Roman possessions in Asia Minor, the inhabitants of which last hailed him as a deliverer. By his orders, a great massacre of the Romans took place, in which, according to one account, 80,000, and according to another, 150,000 were slain. He also sent three pow-

Mitre  
M.tylene

136

erful armies to aid the Greeks in their rebellion, but the disastrous battles of Chimeronea and Orchomenus broke his power in that country. He was, however, driven from Pergamus (85 B.C.) by Flavius Fimbria, and reduced to the necessity of making peace with Sulla, relinquishing all his conquests in Asia, giving up 70 war-galleys to the Romans, and paying 2000 talents. The wanton aggressions of Murena, the Roman legate, gave rise to the *Second Mithridatic War*, in 83 B.C. M. was wholly successful in this war, but peace was concluded on the *status quo*, 81 B.C. M. felt, however, that this was merely a truce, and lost no time in preparing for a third contest, in alliance with Tigranes, king of Armenia, the next most powerful monarch of Asia. Tigranes seized Cappadocia, 76 B.C., and M., in the following year, invaded Bithynia, commencing the *Third Mithridatic War*. M. formed an alliance with Sertorius (q. v.), and obtained the services of Roman officers of the Marian party, who trained his army after the Roman manner. The arms of M. were at first successful; but afterwards the Roman consul Lucullus (q. v.) compelled him to take refuge with Tigranes, 72 B.C. Lucullus then conquered Pontus, defeated Tigranes, 69 B.C., at Tigranocerta, and both Tigranes and M. at Artaxata, 68 B.C. M., however, recovered possession of Pontus. After the war had lingered for some time, Cneius Pompeius (see POMPEY), completed the work of Lucullus, 66 B.C., defeating M. on the Euphrates, and compelling him to flee to the Boeporus. Here his indomitable spirit prompted him to form a new scheme of vengeance, which was, however, frustrated by the rebellion of his son, Pharnaces, who besieged him in Panticapæum. Deeming his cause hopeless, M. put an end to his own life, 63 B.C. M. was a specimen of the true eastern despot, but he possessed great ability, and extraordinary energy and perseverance. His want of success was owing not to his defects as a general, but to the impossibility of raising and training an army capable of coping with the Roman legions, and his system of tactics during the third Mithridatic war, plainly shows his thorough conviction of this fact. He had received a Greek education at Sinope, could speak no less than 25 different languages and dialects, and possessed considerable love for the arts, of which his magnificent collection of pictures, statues, and engraved gems were a proof. In the estimation of the Romans, he was the most formidable opponent they ever encountered, and occasional reports of his various successes spread the utmost terror among them.

**MITRE**, the point or line of union of mouldings meeting at an angle.

**MITRE** (Lat. *mitra*, also *infula*), the head-dress worn in solemn church services by bishops, abbots, and certain other prelates in the Western Church. The name, as probably the ornament itself, is borrowed from the orientals, although, in its present form, it is not in use in the Greek Church, or in any other of the churches of the various eastern rites. The western mitre is a tall, tongue-shaped cap, terminating in a twofold point, which is supposed to symbolise the "cloven tongues," in the form of which the Holy Ghost was imparted to the apostles, and is furnished with two flaps, which fall behind over the shoulders. Opinion is much divided as to the date at which the mitre first came into use. Eusebius, Gregory of Nazianzus, Epiphanius, and others speak of an ornamented head-dress, worn in the church; but there is no very early monument or pictorial representation which exhibits any head-covering at all resembling the modern mitre. From the 9th c., however, it is found in use, although not universally; and instances are recorded in which the popes grant permission to certain bishops to wear the mitre; as, for example, Leo IV. to Anscar, Bishop of Hamburg, in the 9th century. The material used in the manufacture of the mitre is very various, often consisting of most costly stuffs, studded with gold and precious stones. The color and material differ according to the festival or the service in which the mitre is used, and there is a special prayer in the consecration service of bishops, used in investing the new bishop with his mitre. The mitre of the pope is of peculiar form, and is called by the name *Tiara* (q. v.). Although the mitre properly belongs to bishops only, its use is also permitted by special privilege to certain abbots, to provosts of some distinguished cathedral chapters, and to a few other dignitaries. See Binterim, "Denkwürdigkeiten der Kirche," 1 B. 2 Th., p. 343.

The mitre, as an ornament, seems to have descended in the earliest times from bishop to bishop. Among the Cottonian MSS., is an order, dated 1st July, 4 Henry

VL, for the delivery to Archbishop Chicheley of the mitre which had been worn by his predecessor. It was in some cases a very costly ornament. Archbishop Pechiam's new mitre, in 1288, cost £173, 4s. 1d. In England, since the Reformation, the mitre is no longer a part of the episcopal costume, but it is placed over the shield of an archbishop or bishop, instead of a crest. The mitre of a bishop has its lower rim surrounded with a fillet of gold; but the Archbishops of Canterbury and York are in the practice of encircling theirs with a ducal coronet, a usage of late date and doubtful propriety. The Bishop of Durham surrounds his mitre with an earl's coronet, in consequence of being titular Count Palatine of Durham, and Earl of Sedburgh. Before the custom was introduced of bishops impaling the insignia of their sees with their family arms, they sometimes differenced their paternal coat by the addition of a mitre. Mitres are rare as a charge in heraldry, but are sometimes borne as a crest, particularly in Germany, to indicate that the bearers were feudatories, or dependencies of ancient abbeys.

**MITSCHERLICH**, Eilhard, a distinguished Prussian chemist, was born at Neneude, near Jena, in 1794, and died at Berlin in 1863. In 1811, he proceeded to the university of Heidelberg, where he devoted himself to history, philology, and oriental languages; and he continued the study of these subjects at Paris and Göttingen. It seems to have been at the last-named university that (1814 or 1815) he first turned his attention to geology and mineralogy, chemistry and physics, and it was not till 1818, when he was at Berlin, that he selected chemistry as his special study. His observations on the striking similarity between the crystalline form and the chemical composition of the arseniates and the phosphates, led to his discovery of the law of Isomorphism (q. v.), the importance of which was so fully recognised by Berzelius, that he invited the young chemist, in 1819, to Stockholm, where he studied till 1821, when, on the death of Klaproth, he was, on the strong recommendation of Berzelius, appointed to the vacant chair of chemistry at Berlin. One of his earliest discoveries after his appointment was that of the double crystalline form of sulphur, the first observed case of Dimorphism. See *DIMORPHISM*. His investigations regarding the formation of artificial minerals, and his memoirs on Beuzine and on the Formation of Ether must be classed amongst his most important contributions to chemistry; but it is mainly on the discovery of Isomorphism and Dimorphism that his reputation will finally rest. His principal work is his "*Lehrbuch der Chemie*," begun in 1829, and concluded in 1841. It has passed through five editions, and is especially valuable for the clear and simple way in which he has brought mathematics and physics to bear upon the subject. He was an honorary member of almost all the great scientific societies, and received the gold medal from the Royal Society of London for his discovery of the law of Isomorphism.

**MITTAU**, or Mitau, the chief town of the government of Courland, in European Russia, is situated on the right bank of the Aa, 25 miles south-west of Riga, and was founded in 1211 by the grand master of the Teutonic Knights. It was annexed to Russia in 1795. Pop. (1867) 28,100, the majority of whom are Germans by birth or descent, 1000 are Jews, and only a few Russians. The town is indifferently built, the houses being chiefly of wood, and painted of a green or brown color. The most important buildings are the old castle—now the seat of the governor of the province—four churches, an astronomical observatory, a public library, a museum, and a number of educational and charitable institutions. As regards commerce and industry, the town occupies only the third place in the government, its principal product being articles of japanned iron and tin; there is an export trade in hemp, flax, and corn. M. is the winter residence of the gentry of the surrounding country, and was for some time the abode of Louis XVIII.

**MITTIMUS**, an English law-term for a writ by which a record is transferred out of one court into another.

**MITTWEIDA**, a town of Saxony, in the circle of Zwickau, 35 miles south-east of Leipzig. For centuries, M. has been noted for its industry. The principal branches of industry are spinning, cotton-weaving, manufacture of fustian, &c., together with dyeworks and bleach-fields. Pop. (1875) 9093.

**MITYLENE**. See *LEZBOS*.

**MIXED MARRIAGES.** In various countries of Europe, marriages between persons of different religious belief have either been prohibited or put under restrictions. The canon law forbade marriages between Christians and non-Christians; at one time, it merely discouraged, at another altogether prohibited the marriage of orthodox Christians with heretics. Subsequently to the Reformation, papal dispensations were in use to be granted for marriages between Catholics and Protestants, with the condition annexed, that the children should be brought up in the Catholic faith. During the latter part of the 17th c., parents seem to have been left at liberty to make what agreement they pleased on this head; and in default of their making any, it was presumed that the children would follow the religion of their father. In the middle of the 18th c., the validity of mixed marriages, even when celebrated by the civil magistrate, was recognised by the papal court; and under Napoleon's rule, they became common, without stipulations as to the children. The events of 1815 restored sufficient influence to the Roman Catholic Church, to enable the clergy to put in force a rule by which they could refuse to celebrate such marriages without an assurance that the children would be brought up Catholics. By a law of many of the German states, the clergymen of the bride was the only person who could competently officiate, and an engagement of this kind was often not only repugnant to the father as a Protestant, but illegal. Conflicts followed between the civil and ecclesiastical authorities, which have sometimes been obviated by the priest, on whom the law imposes the celebration of the marriage, not pronouncing the nuptial benediction, but giving his presence as a witness along with two other witnesses when the parties declared themselves husband and wife—a kind of marriage whose validity is perfectly recognised by the canon law. In Spain, marriages between Catholics and Protestants have sometimes taken place in this way, avoiding the stipulations otherwise necessary regarding the children.

There was, till lately, a great diversity in the state of the law of mixed marriages in different parts of Germany. Prussia was the first state to do away the former restrictions by the recognition of a civil ceremony alone as that which constitutes marriage in the eye of the law. Until that change, the letter of the law provided that the children should be brought up in the faith of their father, and no compacts to the contrary were allowed. Practically, however, the law was largely evaded, no one having a recognised interest to object to the fulfilment of such agreements. In Bavaria, mixed marriages might be performed either by Protestant or Catholic clergymen; and the spouses had it in their power to make what arrangements they pleased regarding the children before or after marriage; but if no such arrangements happened to have been made, the children were brought up in the religion of their father. In Saxony, and various other German states, the spouses might, before marriage, make what arrangements they liked as to the religion of their children; but if they had made none, the law obliged them to be brought up in the faith of their father. A bill for rendering civil marriage obligatory throughout the empire was brought before the Reichstag in 1874, and passed in 1875, thus extending the system of Prussia to all other German states. This bill enables men and women to be married independently of the consent of the clergy (not always easily obtained in Catholic districts), or of the difference of their religious beliefs. It also allows of children being left unbaptised, and brought up without being assigned to any religious denomination whatsoever. In Austria, the interposition of the Catholic priest is required in marriages between Catholics and Protestants. He need not, however, give the sacerdotal benediction; his passive assistance only is required, either in taking the declaration of the parties, which is followed by a Protestant ceremony, or by being present as a witness at the Protestant ceremony. When the husband is Catholic, all the children must be brought up Catholic; when the husband is Protestant and the wife Catholic, the sons follow the father and the daughters the mother. In Denmark, stipulations may be made before or after marriage, and can be altered by mutual consent of the parents, or, in some cases, even after the death of one of them. Mixed marriages were, till lately, altogether prohibited in some of the Catholic cantons of Switzerland, but they are now authorized in all the cantons by the federal laws. It is generally the clergyman of the husband's creed who officiates, but at Zürich the ceremony is performed in both churches. In most cases, the children are required to be educated in the religion of their father.

In most German states, marriages between Christians and Jews or Mohammed-

dans used to be interdicted; but after 1849, the prohibitions were in individual cases dispensed with. In Denmark, such marriages have been permitted, on condition of the children being brought up Protestants. In Russia, the members of both Greek and Roman communions are prohibited from intermarrying with non-Christians: members of the orthodox Greek Church cannot marry Greek sectaries; but when an orthodox Russian marries a Protestant or Catholic, the benediction must be given in the Greek Church, and the children baptized in the Greek communion. When the parents are of different religions, but neither belongs to the Greek Church, ante-nuptial stipulations will be given effect to; if none have been made, the sons follow the father's faith, the daughters the mother's.

In France, the law regards marriage as a purely civil contract, and recognises only the civil celebration, which is completely separated from the religious rite. As the faith of the parents is not taken cognizance of, questions regarding the religious education of the children cannot arise before the civil tribunals.

The only restriction to which mixed marriages are now subjected in any part of the United Kingdom is imposed by act 19 Geo. II. c. 13, applicable to Ireland only, that a marriage celebrated by a Catholic priest between a Roman Catholic and a Protestant, or a person who within twelve months has been or professed to be a Protestant, or between two Protestants, is null.

**MIXED RACES.** The subject of *mixed races* is one intimately connected with an enlarged study of ethnology. It involves a consideration of the phenomena attendant upon the sexual union between individuals belonging to different varieties of the human race; as, for instance—adopting the classification of Blumenbach—between the European and the negro or the American Indian; or between the American Indian and the negro; or between any of these three and individuals belonging to the Malay and Mongolian varieties. It is well understood that such unions are in general prolific; and not only so, but that their offspring is likewise prolific; and this fact is much relied upon by some ethnologists, as an argument in favor of the unity of the human race. They reason thus: Were the different varieties of mankind distinct species, as has been frequently alleged, then it would necessarily follow that the offspring of such unions would prove as unfruitful as those between the horse and the ass, the goat and the sheep, the wolf and the dog; and similarly with respect to the hybrids among birds, insects, and plants. To sum up, in the words of Dr Prichard, the best exponent of this school of ethnology: "It seems to be the well-established result of inquiries into the various tribes of organized beings, that the perpetuation of hybrids, whether of plants or animals, so as to produce new and intermediate tribes, is impossible. Now, unless all these observations are erroneous, or capable of some explanation that has not yet been pointed out, they lead, with the strongest force of analogical reasoning, to the conclusion, that a number of different tribes, such as the various races of men, must either be incapable of intermixing their stock, and thus always fated to remain separate from each other, or, if the contrary should be the fact, that all the races to whom the remark applies, are proved by it to belong to the same species." Dr Prichard further observes, that so far from such unions between members of different varieties of the human race proving unfruitful, or their offspring unfruitful, the very opposite is the case, as, for instance, in unions between the negro and the European, the most strongly marked varieties of our race. "If we inquire," he says, "into the facts which relate to the intermixture of negroes and Europeans, it will be impossible to doubt the tendency of the so-called Mulattoes to increase. The men of color, or the mixed race between the Creoles and the negroes, are in many of the West India Islands a rapidly increasing people, and it would be very probable that they will eventually become the permanent masters of those islands, were it not for the great numerical superiority of the genuine negroes. In many parts of America, they are also very numerous." It is to America, indeed, both north and south, that we must chiefly look for the numerous and varied phenomena resulting from this intermixture of races; for there we have not only the negro and the European mingling their blood, but the negro and the American Indian, the European and the Indian, and the offspring of each of these with the offspring of the other, or with members of either of the parent stocks; added to which, of late years, the Chinese (of Mongolian race or variety) have appeared upon the scene, thus contributing greatly to the number of what are termed

*human hybrids*. All these, however, are not equally fertile; and with respect even to the Mulattoes, it is alleged by writers of the Morton school of ethnology that they do not perpetuate themselves for many generations. "Nature," says Squier, rather dogmatically, "perpetuates no human hybrids—as, for instance, a permanent race of Mulattoes." And Dr Nott, adopting the classification of species laid down by Dr Morton—namely, *Remote Species*, in which hybrids are never produced; *Allied Species*, which produce, *inter se*, an infertile offspring; and *Proximate Species*, which produce with each other a fertile offspring—is of opinion that it is only by the union of southern or dark-skinned Europeans with negroes that thoroughly prolific Mulattoes are engendered, which is not the case in unions occurring between individuals of the Anglo-Saxon and negro races. In arriving at this conclusion, we cannot help thinking that the author has been helped forward by the strong prejudice existing in the Southern States against all taint of negro blood. A more impartial writer, Professor Wilson, in his "Prehistoric Man," observes: "There are upwards of four millions of people of African blood in the United States, and certainly not less than ten millions throughout the continent and islands of North and South America, and of these the larger proportion consists of hybrids. . . . It is impossible to determine with certainty how far the hybrid colored population of the United States is capable of permanency, either by the development of a fixed hybrid type, or by continuous fertility, until the predominant primary type reasserts its power, by their return to that of the original white or black parent, so long as the mixed breed is constantly augmented in the Southern States by means at variance with the natural and moral relations of social life." As it is, the weight of evidence appears to be in favor of Dr Prichard's view; but until the doctrine of hybridity is better understood, and a more satisfactory answer to the vexed question, "What is species?" has been supplied to us, we must deem it idle to pronounce dogmatically on the subject. See HYBRID and SPECIES. We conclude with a list of half-castes given by Dr Tschudi, "with a few additions from other sources," printed in the appendix to Professor Wilson's valuable work just mentioned.

**MIXTURES** are officinal preparations, extempore in their nature, some of which—as, for example, *Mistura Camphoræ*, *Mistura Cretæ*, and *Mistura Ferri Composita*—are very extensively used in medical practice, either as vehicles for more active remedies, or for their intrinsic value.

**MIZEN**, or Mizzen, the sternmost of the masts in a three-masted vessel, and also the smallest of the three. Above it are the mizen-topmast, the mizen-topgallant-mast, and the mizen-royal. It supports the usual yards, and, in addition, the gaff and boom of the Spanker (q. v.). A rear-admiral hoists his pendant at the mizen.

Although the word mizen is now applied adjectively to the several parts, it appears formerly to have been the name of a large triangular sail carried in the stern, and thence to have become the distinguishing title of the mast which bore that sail. The name is probably from It. *mezzano*, mean, in the middle; in opposition to a square sail, which lies across the vessel.

**MNEMONICS.** See **MEMORY**.

**MNEMOSYNE**, in Classical Mythology, the goddess of Memory, and the mother of the nine muses (q. v.), whom she bore to Jupiter. The principal seat of her worship was at Eleuthera, in Bœtia.

**MOA**, the name given by the New Zealanders to the large wingless or strnthon birds (see **BREVIPENNES**) of which the bones are found imbedded in the sands of the seashore, in swamps, forests, river-beds, and limestone caves, and of which traditions subsist among them as birds living in their country. The largest bones belong to the genus *Diornis* (q. v.), others to *Palapteryx* (q. v.); and with them are found bones of a large bird (*Aptornis*) resembling a swan, supposed to be now extinct, also of the existing species of *Apteryx* (q. v.) and of *Notornis* (q. v.), much smaller birds. It is generally supposed that no large moas have been seen alive since about 1650; but it has recently been again alleged that some have been seen, and rewards have been offered for the capture of them. They are represented by the New Zealanders as stupid, fat, indolent birds, living in forests, mountain fastnesses, &c., and feeding on vegetable food. Their feet are said to have been adapted for digging. They seem to have been extirpated for the sake of their flesh, feathers, and bones. The eggs were eaten. The leg-bones of the moas were filled with marrow, and not with air, as those of other birds.

**MO'ABITES**, a pastoral people, who inhabited the mountainous country east of the lower part of the Jordan and of the Dead Sea. Their *cultus* was characterised by many very odious rites, among which was human sacrifice. In the time of the Judges, the Jews were for eighteen years under the yoke of the M., who were afterwards made tributary by David, bnt. about 900 B.C., shook off their allegiance to the Jewish kings, and afterwards took part with the Chaldeans against the Jews. Their name no longer exists, and the remnants of the people have long been included among the Arabs.

**MOABITE STONE**, The, a stone bearing a long inscription in Hebrew-Phœnician letters, discovered at Dibân in Moab in 1868. It appears to have been erected by Mesha, king of Moab, mentioned in 2 Kings vii., and the inscription refers to his wars with Israel (in the 10th c. B.C.). The negotiations set on foot for its purchase led to quarrels among the Arab tribes claiming an interest in it, and the memorial was unfortunately broken to pieces. The fragments, however, were, with great difficulty collected, and are now preserved in the LOUVRE.

**MOAT**, the ditch round the ramparts of a fortress, may be either wet—i. e., full of water—or dry. In the latter, which is the commoner case, the depth should not be less than 12 feet, nor the width under 24. The more perpendicular the walls, so much the greater will be the obstruction to the enemy. In regular works, the walls are usually revêted with masonry, that at the foot of the rampart being the scarp or escarp, and that below the covered way the counterscarp. See **DITCH** and **FORTIFICATION**.

**MOBILE**, the principal city and only seaport of Alabama, United States of America, is situated on the west side of Mobile River, and at the head of Mobile Bay, which opens into the Gulf of Mexico. It is built with broad shaded streets on a

**Mobile**  
**Mode**

142

sandy plain, rising gradually from the river, with a fine custom-house and post-office, city hall and market-house, theatre, Odd Fellows' Hall, cathedral, 80 churches, 4 orphan asylums, several hospitals, a medical college, St Joseph's College (a Jesuit institution), a convent of the Visitation, and academy for young ladies. M. has several ship-yards, foundries, and cotton-presses. Its chief business is the export of cotton. The average export for five years preceding the Civil War was 632,303 bales; in 1874-5, 131,342 bales, value 9,054,110 dollars, were exported. There is also a large exportation of turpentine, rosin, and tar. Its harbor is defended by Fort Morgan. M. was settled by the French in 1702. Pop. in 1870, 32,034; 1880, 22,132.

**MOBILE**, a river and bay of Alabama, United States of America. The river is formed by the confluence of the Alabama and Tombigbee, 50 m. above Mobile, which lies at its mouth. It is a sluggish stream, with low banks and several channels. The bay is 30 m. from north to south, and 10 or 12 from e. to w. The entrance from the Gulf of Mexico, 3 m. wide, is defended by Fort Morgan and Fort Gaines.

**MO'BILE**, Mobilis, an adjective and verb, used respectively in regard to continental armies, to designate a state of readiness for taking the field, and the act of making ready for such an operation. The process consists in augmenting a regiment from its peace to its war complement, in calling in men on furlough, in organising the staff of divisions and brigades, constituting the commissariat, medical artillery, and transport services, and in accumulating provisions and munitions. As the work of mobilising an army causes great and inevitable expense, it is only resorted to when hostilities appear imminent.

**MOBILIER, Cr dit.** On the 18th November 1853, the French government sanctioned the statutes of a new bank under the name of the *Soci t  G n rale de Cr dit Mobilier*. The name was intended as a contrast to the *Soci t  de Cr dit Foncier*, which are of the nature of land banks, and advance money on the security of real or immovable property; while the *Cr dit Mobilier* proposed to give similar aid to the owners of movable property. The declared object of this bank is especially to promote industrial enterprises of all kinds, such as the construction of railways, sinking of mines, &c. Various privileges were conferred upon it under its charter; in especial, it was allowed to acquire shares in public companies, and to pay the calls made upon it in respect of such shares, by its own notes or obligations; also to sell or give in security all shares thus acquired. The operations of the society were conducted upon a very extensive scale. In 1854, it subscribed largely to the government loan on account of the Russian War, to the Grand Central Railway Company, to the General Omnibus Company of Paris, and to various other important undertakings. The dividend for this year was 12 per cent. In 1855, it lent two sums to the government—the one of 250, and the other of 375 millions of francs. Its operations were vast during this year, and the dividends declared amounted to 40 per cent. The directors had not hitherto availed themselves of their privilege of issuing their own obligations, but this they now resolved on doing. They proposed to issue two kinds—the one at short dates; the other at long dates, and redeemable by instalments. The proposed issue was to amount to 240 millions of francs, but the public became alarmed at the prospect of so vast an issue of paper-money, so that, in March 1856, the French government deemed it necessary to prohibit the carrying out of the proposed scheme. This was a severe blow to the institution. In 1856, its dividends did not exceed 22 per cent.; in 1857, they were only 5 per cent.; in 1860, they were 10 per cent. In 1867, stock fell greatly, and the company had to go into liquidation. The managers, however, retired with large fortunes. The shares are 500 francs, and the market price in January 1876 was 194 francs. The *Cr dit Mobilier* has undoubtedly been highly useful in developing the industrial power of France, but its operations have been hazardous, and had they not been checked in time, they would in all probability have ended in disaster.

**MO'CHA**, the most strongly fortified seaport, and once the capital, of the province of Yemen, in Arabia. It is situated on the Red Sea, at the head of a little bay near the Strait of Bab-el-Mandeb, and 130 miles west-north-west of Aden (q. v.). All round the shore is a hot sandy waste. The principal trade is in coffee, of which 10,000 tons (of the finest quality) are annually exported to Jiddah, Suez, and Bombay. Other exports are dates, gums, balm, ivory, senna, &c. Pop. 5000.

**MOCHA STONES** are pieces of agate or of chalcedony, containing dendritic infiltrations, often assuming appearances very like finely ramified confervæ, &c. They receive the name Mocha Stone because, when they first became known in Europe, they were brought from Mocha. Of the same nature with M. S. are *Moss Agates*. The resemblance of the enclosed infiltrations to plants is often merely accidental, but it appears to be sometimes really due to plants, which were enclosed in the cavity in which the silicious mineral itself was formed.

**MOCKING-BIRD**, or Mocking-Thrush (*Mimus* or *Orpheus*), a genus of birds of the family *Merulide*, having a more elongated form than the true thrushes, a longer tail, shorter wings, and the upper mandible more curved at the tip. They are all American. The best known species, the M. of the United States (*M. polyglottus*), is about the size of the song-thrush; the upper parts of a dark brownish ash color, the wings and tail nearly black, the under parts brownish white. The M. is common in almost all parts of America, from the south of New England to Brazil; north of the Delaware, it is only a summer visitant, but in more southern regions it is found at all seasons. It is one of the most common birds of the West Indies, and its exquisite song fills their groves with melody by night, for which reason it is there very generally known as the Nightingale. By day, the M. is generally imitative, excelling all birds in its power of imitation, now taking up the song of one bird, and now of another, and often deceiving the most practised ear by its perfect performance. By night, its song is for the most part natural. It does not confound itself, however, to musical strains; it seems to take equal pleasure in repeating the harshest cries of the feathered tribes; and in domestication readily adds to its accomplishments the imitation of almost any sound which it is accustomed to hear, passing from one to another with great rapidity, so as to produce an incomparable medley. The M. readily learns to whistle a tune, even of considerable length, but there is no well authenticated instance of its imitating the human voice. The barking of a dog, the mewling of a cat, the crowing of a cock, the cackling of a hen, the creaking of a wheel-barrow, are all within the compass of its powers. During its performances, it spreads its wings, expands its tail, and throws itself about, as if full of enthusiasm and enjoyment. The M. is vocal at all seasons of the year. It enjoys almost everywhere the protection of man, and often makes its nest in a tree or bush close beside a house. Two or three broods are produced in a year. The male is extremely attentive to his mate, and manifests extraordinary courage in driving away enemies from the nest. Mocking-birds often assemble on such occasions, and birds of prey, far superior to them in size and strength, are compelled to retreat. Snakes are killed by reiterated blows on the head, and cats learn to consider the vicinity of a mocking-bird's nest unsafe. The food of the M. consists chiefly of berries and insects. Another species of M. is found in the Rocky Mountains, and species of the same genus are among the finest song-birds of the temperate parts of South America.

**MODE**, in Music. Every musical passage is referrible to and forms part of a succession of sounds having some appreciable relation to one another. This succession of sounds is called the Scale, and is a series of steps leading from a given note called the Key-note, or Tonic (q. v.), to its octave. The steps or degrees of the scale are of unequal size, and on the place of the smaller ones or semitones depends the mode of the music. Taking our natural scale, there are only two notes in it which can satisfy the ear as key-notes—viz., C and A. In the major mode, with C as key-note, the semitone or small interval falls between the third and fourth sounds; in the minor mode, with A as key-note, it falls between the second and third sounds; in the former case, the third of the key-note is a major third, in the latter a minor third. The minor mode further requires to be modified by occasionally sharpening its sixth and seventh, in order to be pleasing to modern ears. The scale of the major mode is derived from simpler harmonic proportions than that of the minor. Melodies composed in the latter mode have generally more or less of a plaintive or melancholy character. For the theory of these modes, see *MUSIC*. Ancient musicians admitted of a greater variety of modes. The Greeks had six, designated the Dorian, Phrygian, Lydian, Mixo-Lydian, Ionic, and Æolian. The Ionic is the modern major, the Æolian the minor mode; the others are more or less intolerable to a modern ear. They are used to a limited extent in the music of the Greek Church, and in the Ambrosian Chant.

Modelling  
Mossia

144

**MO'DELLING** is the process of preparing the original pattern or design from which a work in sculpture is to be cast or carved: the technical details will be found under **SCULPTURE**. Modelling is also practised by medallists; the head or figure intended to be cut in the die being first modelled in relief with wax on a piece of slate. Goldsmiths, silversmiths, and jewellers also model intricate and artistic forms and ornaments of pieces of plate, to be cast and chased by them, or in which jewels are to be set. Wax is the substance used when delicacy and minuteness are required. Modelling is also a branch of the potter's trade. Flaxman modelled for Wedgwood numerous figures and groups in wax. For large models, the material employed is potter's clay, which, when used by sculptors, is mixed with a portion of sandstone, finely pulverised to make it work freely.

**MO'DENA** (anc. *Mutina*), capital of the former duchy of same name, a fortified city of Northern Italy, 24 miles west-north-west of Bologna. Pop. (1871) 80,854. It stands between the rivers Secchia and Panaro, in a pleasant plain, noted for its rich soil and salubrious air, and from its surrounding ramparts commands fine views of the Apennines. Although the social life of M. is somewhat stagnant, it is nevertheless a most agreeable city. It lies on the famous Via Emilia (see **EMILIAN PROVINCES**), by which it is divided into the old and new city, and is connected by a navigable canal with the rivers Secchia and Panaro. Amongst the public buildings, may be noted the cathedral of St Geminianus, the patron of the city, a structure of the purely Lombard style. The campanile or belfry is one of the great towers of Italy; it is a square turreted structure, 315 feet in height, its entire façade being in white marble. The ducal palace, a picturesque structure of the 17th c., is adorned with an infinity of galleries, courts, and marble arches; it contains the splendid Biblioteca Estense, numbering 100,000 volumes, and 3000 rare MSS.; also the valuable Este archives, a most important collection of medieval records, collections of coins and medals of great antiquity, and an observatory. Schools of theology, law, medicine, and mathematics have replaced the university, suppressed in 1821; there are also five museums of natural history, a botanic garden, theatres, and good public baths. The trade of M. is unimportant: the manufactured products are confined to linen and woollen fabrics, leather, hats, paper, glass, and pottery, besides silk manufactured to a much less extent than formerly. M. is the birthplace of the great anatomist Fallopius, and the antiquary Sigonio.

The ancient history of M. affords evidence that it enjoyed at an early period a considerable degree of prosperity; the splendor, wealth, and arts of the city of M. being mentioned by Cicero, Pliny, and Strabo. In modern times, M. has shared more or less the various vicissitudes which befell Italy, and participated in the great internecine feuds of the country. In 960, a member of the great House of Este was proclaimed Marquis of Modena, and in 1452 the then reigning marquis was created duke by the Emperor Frederick III. In 1796, M. formed part of the Cisalpine Republic, but was restored in 1814 by the congress of Vienna to the reigning family. The duchy had at that time an area of 2310 square miles, and a population of 636,000. In 1844, the Duke of Modena was temporarily deprived of his rights; and in 1860, the population definitively expelled the unpopular ruler, who carried off all the property and valuables within his reach, including the silver handles of the palace doors. M. is now a province of the kingdom of Italy: area 960 sq. m.; pop. (1871) 278,231.

**MO'DERATOR**, a term used in Scotch ecclesiastical law to describe the chairman or president of a Presbyterian church-court.

**MO'DICA**, the Mohac of the Saracens, a city of the island of Sicily, in the province of Val di Noto, 90 m. from Syracuse. Pop. (1872) 33,169. The city, which stands perched amidst rocks, contains several fine buildings, and, notwithstanding the humidity of the climate, the sanitary condition of the inhabitants seems satisfactory. The soil of the surrounding district is the most productive of Sicily, and yields vast quantities of corn, tobacco, oil, wine, hemp, which, with cheese, wool, soda, and butter, form the chief export trade of the place. The valley of Ispica, or Ispica, in the vicinity of M., contains remarkable rocks, in which numerous dwellings are excavated.

**MOD'ILLION**, an ornamental bracket, much used in classic architecture, especially in the cornices of the Corinthian and Composite styles.

**MODULATION**, in Music. When in the course of a melody the key-note is changed, and the original scale altered by the introduction of a new sharp or flat, such change is called modulation. Much of the pleasure of music is derived from a judicious use of modulation. The art of good modulation from one key to another consists in the proper choice of intermediate chords. Sudden transitions, without intermediate chords, should be employed but sparingly, and in peculiar circumstances. Every piece of music is composed in a particular key, in which it begins and ends, which generally predominates over any other keys that may be introduced in the course of the composition.

**MO'DULE**, in Classic Architecture, an arbitrary measure for determining the proportions of the various members of the orders. The diameter, semi-diameter, or one-third of the diameter are most frequently used; the first being usually divided into 60 parts (or minutes), the second into 30 parts, and the third into 20 parts.

**MODULUS**, a constant coefficient or multiplier; by means of which one series or system of quantities can be reduced to another similar series or system. Thus we have the modulus of Elasticity (q. v.), of Friction (q. v.), and of systems of Logarithms (q. v.). The system of logarithms which is universally accepted as the primary is Napier's, and from it all other systems are deduced in the following manner: Let  $N$  be a number of which the Napierian logarithm is  $b$ ,  $e$  being the Napierian base, it is required to find the logarithm of  $N$  to some other base  $a$ . Let  $x$  be this logarithm, then (see LOGARITHMS)  $N = e^b = a^x$ , and taking the Napierian logarithms of both sides of this equation,  $b \log. e = x \log. a$ , or (since  $\log. e = 1$ )  $b = x \log. a$ ,

therefore  $x = \frac{b}{\log. a}$ ; i. e.,  $\log. a N = \frac{\log. e N}{\log. a} = \frac{1}{\log. a} \times \log. e N$ . This multiplier, or

"modulus,"  $\frac{1}{\log. a}$ , is independent of  $N$ , and is therefore constant for the reduction of all Napierian logarithms to the system whose base is  $a$ . If  $a = 10$ , the multiplier becomes  $\frac{1}{\log. 10}$ , the modulus of Briggs's, or the common system of logarithms, and

is equal to  $\frac{1}{2.30258509} = .4342944 \dots$

**MO'DUS**, in English Law, means a peculiar custom by which lands become exempted from payment of tithes on paying some composition or equivalent.

**MÖEN**, a Danish island in the Baltic Sea, separated from Seeland on the north-west by the *Ulfsund*, and from Falster on the south-west by the *Grönsund*. It is 19 miles long, by about 5 miles in average breadth. Area, 84 square miles. Pop. about 15,000, who are supported by agriculture, fisheries, and commerce. It has been called the Switzerland of Denmark, and is remarkable for the irregularity of its surface. The soil is fruitful. Its chief town and seaport, Stege, has a population of (1870) 1960.

**MÖRIS**, Lake, the ancient name of a sheet of water in Egypt, now known as *Birket-el-Kerûn*, or *El-Korn* ("The Lake of the Promontory"), is situated in the province of Fayûm, about 60 miles south-west of Cairo; extreme length from north-east to south-west, 30 miles; breadth, 6 miles; it was formerly much larger. Its average depth is 12, and its greatest ascertained depth 23 feet. On the north and west, its shores are rocky, but on the south, flat and sandy. It is connected with the Nile by a canal called *Bahr-Jusuf* ("The River of Joseph"). The waters are brackish, on account of their being impregnated with the alkaline salts of the desert, and with the muriate-of-lime depositions of the surrounding hills. In the time of the Pharaohs, the revenue derived from the fisheries was applied to the maintenance of the queen's wardrobe and perfumes. Under the Persians, they were let (during the season of the inundations, when the canal fed the lake) at £150 a day. At present, however, they only yield about £34 a year.

**MÖSIA**, an ancient Roman province, bounded by the Danube on the n., the

**Mæso**  
**Mohammed**

146

Black Sea on the e., the mountain-chains of *Hæmus* (Balkan) and *Orbelus* on the s., that of *Scardus* and the rivers *Drinus* (Driua) and *Savus* (Save) on the w. The river *Ciabus* (Cibriz) divided it into two parts, of which the Eastern (*Mæsia Inferior*) is the present Bulgaria, and the Western (*Mæsia Superior*) is Servia. Its original inhabitants were mostly of Thracian race. Gaulish or Celtic invaders settled in Western Mæsia about 277 B.C., under the name of *Scordisci*. The Romans first came in contact with the tribes of M. after the conquest of Macedonia, when C. Scribonius Curio forced his way as far north as the Danube, and gained a victory over the Mæsiæns (75 B.C.), but the country was not completely subjugated till 29 A.C. It was made a Roman province in the reign of Augustus, and flourished for more than two centuries, but as a frontier province it was much exposed to hostile invasions, and required a line of fortresses and stations all along the south bank of the Danube. In 250 A.D., the Goths made an irruption into the country, and defeated and slew the Roman emperor, Decius. In the following year, and about the end of the 4th c., it was given up to them by the Emperor Theodosius I. Slavonian tribes settled in M. in the 6th and 7th centuries.

**MÆSO-GOTHS**, the name given to the Goths who in the 8d c. settled in Lower Mæsia at the mouth of the Danube. Ulfilas (q. v.) was a Mæso-Goth. The name, however, became of more general use to designate those who remained in Mæsia after the great migration in the beginning of the 5th century.

**MOFFAT**, Robert, a distinguished missionary, was born at Ormiston, East Lothian, on the 21st of December 1795. Having resolved to become a missionary to the heathen, he offered his services to the London Missionary Society, was accepted, and sent by them to South Africa. Arriving at Cape Town in 1817, he immediately proceeded beyond the boundaries of Cape Colony to Namaqualand, where he entered upon his labors at the kraal of Africaner, a chief whose name had long been a terror to the people of the neighboring districts of the colony, on account of the audacious raids which he made among their settlements, and his ferocious character, but who had lately become a convert to Christianity, and now shewed a warm desire for its promotion. Here M. labored for three or four years with great success, Christianity and civilisation advancing together. But the situation, on account of the drought and sterility of the country, and its very thinly scattered population, being unsuitable for a principal mission-station, he set out in search of a better locality, and labored at several stations in succession in the countries to the north and north-east of Cape Colony. Wherever he went, the gospel was gladly received by some of those who heard it, and in some places by many. In every place he also guided the people in the arts of civilised life. He made several missionary tours, and his adventures were very remarkable, and are graphically described in his work, "Missionary Labors and Scenes in Southern Africa" (Lond. 1842), which he wrote and published during a visit of several years to Britain, rendered necessary by the state of his health. In 1842, M. returned to his labors in that country, and came back to England in 1870. His daughter was the wife of the celebrated Dr Livingstone. In 1873 he was presented with a sum of £5800 in recognition of his great services. He lectured on African missions in the nave of Westminster Abbey in 1876.

**MO'FFAT**, a market-town and favorite watering-place of Scotland, in the county of Dumfries, stands in the upper part of the broad and beautiful valley of the Annan, and is surrounded by hills of moderate elevation. It is two miles from the Beattock station, on the Caledonian Railway, and 19 miles north-north-east of Dumfries. Among other public edifices are the baths and the reading and assembly rooms. The mineral springs, the principal of which, like that of Harrogate, is saline and sulphurous, are highly celebrated; but perhaps the greatest attractions of the place are its salubrious air and exquisite environs. During the season, the town is increased in population by from 800 to 1000 visitors, to suit whose convenience great numbers of elegant villas, commanding fine views of the neighboring country, have been erected. Pop. (1871) 1730.—The Moffat Hills extend between the counties of Lanark and Peebles in the north, and Dumfries in the south; highest summit Hartfell, 2650 feet. See Black's "Guide to Moffat."

**MOGADO'RE**, or *Sne'rra*, a fortified town, and the principal seaport of Morocco, 130 miles west-south-west of the city of that name, on the Atlantic Ocean. Pop. about 20,000. It is the port of the capital, and was founded in 1760, on the site of

an old Portuguese fort. It stands on a rocky promontory, opposite an island of the same name, long a haunt of pirates, which forms the harbor, and is said to be the best built town of the kingdom. Its streets are regular, though narrow, and it consists of two parts, each surrounded by water. The quarter called the Fortress contains the custom-house, and the treasury, and is the residence of the pasha, the vice-consuls, and the Christian merchants. The town is defended by four batteries on the island, and by a fort on the land-side; the walls are also defensible. *M.* is the seat of considerable trade; it exports olive-oil, wool, gum, hides, feathers, gold-dust, and almonds. In 1873, 114 vessels, of 28,907 tons, entered, and 211 of 27,913 tons, cleared the port. The value of the cargo of those entering was £263,718; of those clearing, £259,930. The imports are woollens, cotton, hardware, &c.

**MOGUER** (Arab. "caves," of which there are many in the neighborhood), a town of Spain, in the province of Huelva, 43 miles west-south-west of Seville, rises gently above the Rio Tinto, near the mouth of which is its port, Palos. The streets are generally broad and straight, but both the town and castle are much dilapidated. The old Franciscan convent was ordered in 1846 to be preserved as a national memorial, but it is now fast going to ruin, and the wood of the cells stripped off. It was here, in 1484, that Columbus, craving charity, was received by the prior, Juan Perez de Marchena, by whose influence he was enabled to prosecute his discoveries, setting out from the port of Palos on August 3, 1492. It was to this port also that he returned, March 15, 1493, after having accomplished the great end of his expedition. Here likewise did Cortes land in May 1523, after the conquest of Mexico, and lodged in the same convent which gave shelter to Columbus. Palos is now a poor decayed fishing-port. *M.* has some trade in wine and fruit. Pop. 6600.

**MOGU'L**, Great, the popular designation of the emperor of Delhi, as the impersolation of the powerful empire established in Hindustan by the Mongols (q. v.), who were called *Moguls* by the Persians. The first Great Mogul was Baber, the great-grandson of Timur, who founded the Mongul empire in Hindustan in 1526. In 1603, the Great Mogul was deprived of his throne; in 1627, of even the appearance of authority, becoming a mere pensioner of the British; and in 1658, Mohammed Bahadur, the last of the dynasty, was condemned, and transported for complicity in the Indian mutiny.

**MOHACS**, a market-town of Hungary, 110 miles s.-s.-w of Pesth, on the western arm of the Danube. It contains a gymnasium, has an important cattle-market, is a station for steamboats on the Danube, and the seat of considerable trade in wine, coal, timber, and agricultural products. Pop. (1869) 12,140. It owes its historical importance to the great battle fought here, 29th August 1526, between Lewis II. of Hungary, with 25,000 Hungarians, and the Sultan Soliman, at the head of about 300,000 Turks. The battle resulted in the disastrous defeat of the Hungarians, who lost their king, 7 bishops, many nobles and dignitaries, and upwards of 22,000 men. A second battle was fought here on Aug. 12, 1687, when the Turks in their turn were defeated by an Austro-Hungarian army under Charles of Lorraine.

**MO'HAIR**, the wool of the Angora Goat (see GOAT and ANGORA), a native of Asia Minor. Few animals have so beautiful a covering as the fine, soft, silky, long, and always pure white wool of this goat. Each animal, at the annual clip in April or May, yields from 2 lbs. to 4 lbs. of wool. It is only within the last 30 years that *M.* has been in great request in Britain, but its development as an article of trade has been simultaneous with that of alpaca. In 1876 the amount of mohair and other goats' hair imported was 5,848,199 lbs.; the value £711,717. See WOOLLEN MANUFACTURES.

**MOHAMMED** (Arab. *the Praised*), the name taken, at a later period, by the founder of Islam. He was originally called *Halabi*. He was born about the year 570 A. D., at Mecca, and was the son of Abdallah, of the family of the Hashim; and of Amina, of the family of Zuhra, both of the powerful tribe of the Koreishi, but of a side-branch only, and therefore of little or no influence. His father, a poor merchant, died either

\* Or, according to Deutsch, whose view is fully corroborated and adopted by Sprenger in his "Leben und Lehre Mohammads," in allusion to Hag. ii. 7, the predicted Messiah.

before or shortly after M.'s birth, whom his mother then (according to a doubtful tradition) is supposed to have handed over, after the fashion of her tribe, to a Beduin woman, that she might nurse him in the salubrious air of the desert. In consequence of the repeated fits of the child, however, which were ascribed to demons, the nurse sent him back in his third year. When six years old, he also lost his mother. His grandfather, Abd-Al-Mutallib, adopted the boy; and when, two years later, he too died, M.'s uncle, Abu Talib, though poor himself, took him into his house, and remained his best friend and protector throughout his whole life. The accounts which have survived of the time of his youth are of too legendary a nature to deserve credit; certain, however, it seems to be that he at first gained a scanty livelihood by tending the flocks of the Meccans, and that he once or twice accompanied his uncle on his journeys to Southern Arabia and Syria. In his 25th year, he entered the service of a rich widow, named Chadidja, likewise descended from the Koreish, and accompanied her caravans—in an inferior capacity, perhaps as a camel-driver—to the fairs. Up to that time, his circumstances were very poor. Suddenly his fortune changed. The wealthy, but much older, and twice widowed Chadidja offered him her hand, which he accepted. She bore him a son, Al-Kâsim—whence M. adopted the name Abu Al-Kâsim—and four daughters: Zainab, Rukajja, Umm Kulthûm, and Fâtima; and afterwards a second son, whom he called Abd Mauf, after an idol worshipped among his tribe. Both his sons, however, died early. M. continued his merchant's trade at Mecca, but without much energy, spending most of his time in solitary contemplations. In his 35th year, he is said to have, by chance only, been chosen arbiter in a quarrel about the replacig of the sacred black stone in the Kaaba (q. v.); but not before his 40th year is there anything really important to be told of his life.

Before, however, entering on the weighty events of the subsequent period, it is by no means unimportant to advert to such traits of M.'s outward appearance as are yet recoverable. He was of middle height, rather lean, but broad shouldered, and altogether of strong build; slightly curled black hair flowed round his strongly developed head; his eyes, overhung with thick eyelashes, were large and coal-black; his nose, large and slightly bent, was well formed. A long beard added to the dignity of his appearance. A black mole between his shoulders became afterwards among the faithful "the seal of prophecy." In his walk, he moved his whole body violently, "as if descending a mountain." His gait and presence were altogether of an extremely imposing nature. In his 40th year M. received his first "revelation," or, in other words, became first aware that he had a "mission." About the year 600 A.D., Christianity had penetrated into the heart of Arabia, through Syria on the one, and Abyssinia on the other hand. Judaism no less played a prominent part in the peninsula, chiefly in its northern parts, which were dotted over with Jewish colonies, founded by emigrants after the destruction of Jerusalem; and round about Yathrib (Medina). Besides these two all-important religious elements, several sects, remnants of the numerous ancient sects which had sprung up everywhere during the first Christian centuries: Sabians, Mandæans, &c., on the frontiers of Syria and Babylonia, heightened the religious ferment which, shortly before the time of M., had begun to move the minds of the thoughtful. At that time there arose, according to undoubted historical accounts, several men in the Hedjaz (Waraka, Obaid Allah, Othman, Zayd, &c.), who preached the futility of the ancient pagan creed, with its star-worship, its pilgrimages, and festive ceremonies, its temples and fetiches. It had in reality long ceased to be a living faith, and only the great mass of the people clung to it as to a sacred inheritance from times immemorial. The unity of God, the "ancient religion of Abraham," was the doctrine promulgated by these forerunners of M., and many of those who, roused by their words, began to search for a form of religion which should embody both the traditions of their forefathers and a purer doctrine of the Divinity, turned either to Judaism or to Christianity. The principal scene of these missionary labors was Mecca, then the centre of the pilgrimages of most of the Arabian tribes, and where, from times immemorial, long anterior to the city itself, the Kaaba (q. v.), Mount Arafat, the Valley of Mina, &c., were held sacred—the Koreish, M.'s tribe, having the supreme care over these sanctuaries, ever since the 5th century. It was under these circumstances that M. felt "moved" to teach a new faith, which should dispense with idolatry on the one, as with Judaism and Christianity on the other hand. He was 40 years of

age, as we said, when he received the first "divine" communication in the solitude of the mountain Hira, near Mecca. Gabriel appeared to him, and in the name of God commanded him to "read"—that is, to preach the true religion, and to spread it abroad by committing it to writing (Sur. xcvi.). How far M. was a "prophet," in the common sense of the word, has been the subject of endless and utterly futile discussions in the Christian world. That he was no vulgar impostor, is now as generally recognised as that other once popular doctrine, that he was in league with the devil, is rejected by thinking men. What part his epilepsy had in his "visions" we are not able to determine. Certain it is that, after long and painful solitary broodings, a something—not clearly known to himself—at times moved him with such fearfully rapturous vehemence, that, during his revelations, he is said to have roared like a camel, and to have streamed with perspiration; his eyes turned red, and the foam stood before his mouth. The voices he heard were sometimes those of a bell, sometimes of a man, sometimes they came in his dreams, or they were laid in his heart. Waraka, one of his wife's relatives, who had embraced Judaism, spoke to him of the Jewish doctrine, and told him the story of the patriarchs and Israel; not so much as it is told in the Bible, but in the Midrash; and the gorgeous hues of the legendary poetry of the latter seem to have made an deep impression on M.'s poetical mind as the doctrine of the unity of God and the *morale*—in its broad outline—of the Old Testament, together with those civil and religious laws, scriptural and oral, which are either contained as germs or fully developed in this record. Christianity exercised a minor influence upon him and his spiritual offspring. All his knowledge of the New Testament was confined to a few apocryphal books, and with all the deep reverence before Jesus, whom, together with Moses, he calls the greatest prophet, next to himself, his notions of the Christian religion and its founder were excessively vague. For some details on these points, however, we must refer to KORAN and MOHAMMEDANISM.

His first revelation he communicated to no one, it would appear, except to Chaddja, to his daughters, his stepson Ali, his favorite slave Zaid—whom he had probably freed and adopted by this time—and to his friend the prudent and honest Abu Bekr. His other relatives rejected his teachings with scorn. Abu Lahab, his uncle, called him a fool; and Abu Talib, his adoptive father, although he never ceased, for the honor of his family, to protect him, yet never professed any belief in M.'s words. In the fourth year of his mission, however, he had made forty proselytes, chiefly slaves and people from the lower ranks; and now first some verses were revealed to him, commanding him to come forward publicly as a preacher, and to defy the scorn of the unbelievers. With all his power, he now inveighed against the primeval superstition of the Meccans, and exhorted them to a pious and moral life, and to the belief in an all-mighty, all-wise, everlasting, indivisible, all-just, but merciful God, who had chosen him as he had chosen the prophets of the Bible before him, so to teach mankind that they should escape the punishments of hell, and inherit everlasting life. God's mercy—this was a primitive doctrine, common to the whole East—was principally to be obtained by prayer, fasting, and almsgiving. The belief in the sacredness of the Kaaba and the ceremonies of the pilgrimage was too firmly rooted in his and the people's minds not to be received into the new creed; but certain barbarous habits of the Bedouins, such as the killing of their new-born daughters, were ruthlessly condemned by Mohammed. The prohibition of certain kinds of food also belongs to this first period, when he as yet entirely stood under the influence of Judaism; the prohibition of gambling, usury, &c., probably being of a somewhat later date. Whether he did or did not understand the art of writing and reading at the commencement of his career, is not quite clear; certain it is that he pretended not to know it, and employed the services of an amanuensis for his Koranic dicta, which at first consisted merely of brief, rhymed sentences in the manner of the ancient Arabic soothsayers. [KORAN.] The Meccans did not object to his deluging; they considered him a common "poet" or "soothsayer," who, moreover, was not in his right senses, or simply a liar. Gradually, however, as the number of his converts increased, they began to pay more and more attention to his proceedings; and finally, fearing mostly for the sacredness of Mecca, which the new doctrine might abolish, thus depriving them of their chief glory and the ample revenues of the pilgrimages, they rose in fierce opposition against the new prophet and his adherents, who dared "to call their ancient gods idols, and their ancestors fools." Many of the converted

slaves and freedmen had to undergo terrible punishments; and others suffered so much at the hands of their own relatives, that they were fain to revoke their creed; so that the prophet himself advised his followers to emigrate to Abyssinia. M. himself, although protected by the strong arm of Abu Talib, was yet at that time so low-spirited and fearful, that he even raised the idols, which hitherto he had represented as nought, to intermediate beings between God and man—a dictum, however, which he soon revoked, as an inspiration of Satan, thereby increasing the hatred of his adversaries, at whose head stood two members of the family of Machzûm, Al-Walid and Abulhakam Amr (called by Mohammed "Father of Foolishness"), and who in every way tried to throw ridicule on him. At last it became necessary that he should be put beyond the reach of his persecutors, and Abu Talib hid him in a fortified castle of his own in the country. Hamza, his uncle, and Omar, formerly a bitter enemy of M., and who afterwards, with M. and Abu Bekr, became the third head of Islam, continued in the meantime to spread the new doctrine. The Koreish now demanded that M. should be delivered into their hands; but Abu Talib steadfastly refused to comply with their wishes; a feud thereupon broke out between their family and that of the Hashemites, and M. and all the members of his family, except, perhaps, Abu Lahab, were excommunicated. After the space of three years, however, the "peace party" in Mecca brought about a reconciliation, and M. was allowed to return. A great grief befell him at this time—his faithful wife Chaddja died, and, shortly afterwards, his uncle Abu Talib, and, to add to his misery, the vicissitudes of his career had reduced him by this time to poverty. An emigration to Taif, where he sought to improve his position, proved a failure; it was with great difficulty that he escaped with his bare life. During this epoch, he had the well-known dream of his journey to Jerusalem and in the heavens on the back of the Borak (Miraj), the relation of which caused even his staunchest adherents to smile at his hallucination. Shortly after his return from Taif, he married Sauda, and afterwards so increased the number of his wives, that at his death he still left nine, of whom Ayishah, the daughter of Abu Bekr, and Hafsa, the daughter of Omar, are best known. In the midst of his vain endeavors to find a hearing in his own city, and those near it, he succeeded, during a pilgrimage, in converting several men from Medina, whose inhabitants had long been accustomed to hear from the mouths of the numerous Jews living in the city and its neighborhood the words Revelation, Prophecy, God's Word, Messiah: to the Meccans mere sounds without any meaning. The seed sown into the minds of these men bore a fruitful harvest. The next pilgrimage brought twelve, and the third more than seventy adherents to the new faith from Medina, and with these he entered into a close alliance. M. now conceived the plan to seek refuge in the friendly city of Medina, and about 622 (ten, thirteen, or fifteen years—according to the different traditions—after his first assuming the sacred office) he fled thither, about one hundred families of his faithful flock having preceded him some time before, accompanied by Abu Bekr, and reached, not without danger, the town, called thence *Medinat Annabi* (City of the Prophet), or Medina "City," by way of eminence; and from this flight or rather from the first month of the next Arabic year, dates the Mohammedan Era (Hedjah). Now everything was changed to the advantage of the prophet and his religion; and if formerly the incidents of his life are shrouded in comparative obscurity, they are, from this date, known often to their most insignificant details. Formerly a despised "madman or impostor," he now assumed at once the position of highest judge, lawgiver, and ruler of the city and two most powerful Arabic tribes. His first care was directed towards the consolidation of the new worship, and the inner arrangements in the congregation of his flock; his next chief endeavor was to proselytise the numerous Jews who inhabited the city, to whom, besides having received their principal dogmas into his religion, he made many important concessions also in the outer observances of Islam, and concluded alliances with many of their tribes; but he was sorely disappointed in his hopes to convert them. They ridiculed his pretension to be the Messiah, and so enraged him by their constant taunts, that he soon abrogated his concessions, and became their bitterest adversary up to the hour of his death. The most important act in the first year of the Hedjah was his permission to go to war with the enemies of Islam in the name of God—a kind of manifesto chiefly directed against the Meccans. Not being able at first to fight his enemies in open field, he endeavored to weaken their power by

attacking the caravans of the Koreish on their way to Syria. Being successful enough to disturb their trade, and, at the same time, to conclude alliances with the adjoining Beduin tribes, he at last dared to break even the peace of the sacred month of Radjab, and with this the signal to open warfare was given. A battle, the first, between 314 Moellins and about 600 Meccans was fought at Badr, in the second year of the Hedjrah; the former gained the victory, and made many prisoners. A great number of adventurers now flocked to M.'s colors, and he successfully continued his expeditions against the Koreish and the Jewish tribes, chiefly the Beni Keinukâ, whose fortified castles he took after a long siege. Notwithstanding a severe loss which he suffered in the battle near Ohod, in which he himself was dangerously wounded, his power increased so rapidly that in the sixth year of the Hedjrah already he was able to proclaim a public pilgrimage to Mecca. Although the Meccans did not allow this to be carried out, he gained the still greater advantage, that they concluded a formal peace with him, and thus recognised him as an equal power and belligerent. He was now allowed to send his missionaries all over Arabia, and even beyond the frontiers, without any hindrance; and in the following year he had the satisfaction of celebrating the pilgrimage for three days undisturbed at Mecca. Shortly afterwards, during his expeditions against the Jews of Chaibar and Fadak, M. very nearly lost his life: a Jewess, Zainab by name, a relative of whom had fallen in the fight against him, placed a poisoned piece of roast meat before him, and although he merely tasted it, he yet, up to his death, suffered from the effects of the poison. His missionaries at this time began to carry his doctrines abroad, to Chosroes II., to Heraclius, to the king of Abyssinia, the Viceroy of Egypt, and the chiefs of several Arabic provinces. Some received the new gospel; but Chosroë Parvis, the king of Persia, and Amru the Ghassawide, rejected his proposals with scorn, and the latter had the messenger executed. This was the cause of the first war between the Christians and the Muslime, in which the latter were beaten with great loss by Amru. The Meccans now thought the long-desired moment of revenge at hand, and broke the peace by committing several acts of violence against the Chuzaites, the allies of Mohammed. The latter, however, marched at the head of 10,000 men against Mecca, before its inhabitants had had time to prepare for the siege, took it, and was publicly recognised by them as chief and prophet. With this the victory of the new religion was secured in Arabia. While, however, employed in destroying all traces of idolatry in the besieged city, and fixing the minor laws and ceremonies of the true faith, M. heard of new armies which several warlike Arabic tribes marched against him, and which were concentrated near Talf (630). Again he was victorious, and his dominion and creed extended further and further every day. From all parts flocked the deputations to do homage to him in the name of the various tribes, either as the messenger of God, or at least as the Prince of Arabia, and the year 8 of the Hedjrah was therefore called the year of the Deputations. Once more he made most extensive preparations for a war against the Byzantines; but not being able to bring together a sufficient army, he had to be satisfied with the homage of a few minor princes on his way to the frontiers, and to return without having carried out his intention. Towards the end of the 10th year of the Hedjrah he undertook, at the head of at least 40,000 Muslims, his last solemn pilgrimage to Mecca, and there (on the Mount Arafat) instructed them in all the important laws and ordinances, chiefly of the pilgrimage; and the ceremonies observed by him on that occasion were fixed for all times. [HAJJ.] He again solemnly exhorted his believers to righteousness and piety, and chiefly recommended them to protect the weak, the poor, and the women, and to abstain from usury.

Returned from Mecca, he occupied himself again with the carrying out of his expedition against Syria, but fell dangerously ill very soon after his return. One night, while suffering from an attack of fever, he went to the cemetery of Medina, and prayed and wept upon the tombs, praising the dead, and wishing that he himself might soon be delivered from the storms of this world. For a few more days he went about; at last, too weak further to visit his wives, he chose the house of Ayesha, situated near a mosque, as his abode during his sickness. He continued to take part in the public prayers as long as he could; until at last, feeling that his hour had come, he once more preached to the people, recommending Abu Bekr and Uma, the son of Zaid, as the generals whom he had chosen for the army. He then asked,

like Moses, whether he had wronged any one, and read to them passages from the Koran, preparing the minds of his hearers for his death, and exhorting them to peace among themselves, and to strict obedience to the tenets of the faith. A few days afterwards, he asked for writing materials, probably in order to fix a successor to his office as chief of the faithful; but Omar, fearing he might choose Ali, while he himself inclined to Abu Bekr, would not allow him to be furnished with them. In his last wanderings he only spoke of angels and heaven. He died in the lap of Ayesha, about noon of Monday the 12th (11th) of the third month, in the year 11 of the Hedjrah (5th of June 634). His death caused an immense excitement and distress among the faithful, and Omar, who himself would not believe in it, tried to persuade the people of his still being alive. But Abu Bekr said to the assembled multitude: "Whoever among you has served Mohammed, let him know that Mohammed is dead; but he who has served the God of Mohammed, let him continue in his service, for he is still alive, and never dies." While his corpse was yet unburied, the quarrels about his successor, whom he had not definitely been able to appoint, commenced; and finally, Abu Bekr received the homage of the principal Muehlms at Medina. M. was then buried in the night from the 9th to the 10th of June, after long discussions, in the house of Ayesha, where he had died, and which afterwards became part of the adjoining mosque.

This, in briefest outline, is M.'s career. We have not been able to dwell, as we could have wished to do, with any length, either on the peculiar circumstances of his inner life, which preceded and accompanied his "prophetic" course, nor on the part which Idolatry, Judaism, Christianity, and his own reflection respectively, bore in the formation of his religion; nor have we been able to trace the process by which his "mission" grew upon him, as it were, and he, from a simple admonisher of his family, became the founder of a faith to which now above 130 millions are said to adhere. The articles **KORAN** and **MOHAMMEDANISM** contain some further details on his doctrine and its history. We have, in addition to the few observations on the points indicated at the beginning, only to reiterate, that a man of Mohammed's extraordinary powers and gifts is not to be judged by a modern common-place standard; and that the manners and morals of his own time and country must also be taken into consideration. We are far from overrating his character. He was at times deceitful, cunning, even revengeful and cowardly; and generally addicted beyond limit to sensuality. But all this does not justify the savage and silly abuse which has been heaped upon his name for centuries by ignorance and fanaticism. Not only his public station as prophet, preacher, and prince, but also his private character, his amiability, his faithfulness towards friends, his tenderness towards his family, and the frequent readiness to forgive an enemy; besides the extreme simplicity of his domestic life (he lived, when already in full power, in a miserable hut, mended his own clothes, and freed all his slaves), must be taken into consideration; and, to do him full justice, his melancholic temperament, his nervousness, often bordering on frenzy, and which brought him to the brink of suicide, and his being a poet of the highest order, with all the weaknesses of a poet developed to excess, must not be forgotten. Altogether, his mind contained the strangest mixture of right and wrong, of truth and error. Although his self-chosen mission was the abolition of superstition, he yet believed in Jins, omens, charms, and dreams, and this is an additional reason against the, as we said, now generally abandoned notion, that he was a vulgar designer, who by no means deceived himself about those revelations which he pretended to have received. And however much the religion of Islam may, rightly or wrongly, be considered the cause and prime cause of the rottenness of eastern states and nations in our day, it must, in the first place, not be forgotten that it is not necessarily Islam which has caused the corruption, as indeed its ethics are for the most part of the highest order; and in the second place, that Mohammed is not to be made responsible for all the errors of his successors. Take him all in all, the history of humanity has seen few more earnest, noble, and sincere "prophets"—using the word prophet in the broad human sense of one irresistibly impelled by an inner power to admonish, and to teach, and to utter austere and sublime truths, the full purport of which is often unknown to himself.

The most important European biographies of M. are those of Sprenger, Well, Muir, Nöldeke, Renaud. See also **KORAN**, **MOHAMMEDANISM**, **SUNNA**.

**MOHAMMED**, the name of four sultans of Turkey, of whom the most noted is **MOHAMMED II.**, surnamed *Bujuk* or the **THE GREAT**, the conqueror of Constantinople. He was born at Adrianople in 1430, and succeeded his father, Amurath II., in 1460. His first acts were the murder of his two brothers, and the suppression of a rebellion in Karaman. Having thus secured himself on the throne, he bent all his energies to the accomplishment of the great project which had always been kept prominently in view by his predecessors—the capture of Constantinople. This city was now the sole remnant of the once mighty empire of the Cæsars; and after more than a year spent in preparations, M. commenced the siege, 6th April 1453, with an army of 258,000 men, and a fleet of 320 vessels. The Greeks, aided by a gallant band of 2000 strangers, under Gian Justiniani, a noble Genoese, long maintained an obstinate resistance. On the morning of the 29th May, a combined attack was made by land and sea without success; but the retirement from the ramparts of Justiniani, who had been severely wounded; and despaired of a successful defence, caused a panic among his followers, and the simultaneous charge of a cho-en body of janizaries, with M. himself at their head, was irresistible. Constantine XIII. died in the breach, and the Turks poured in over his corpse to plunder and devastate his capital. M. now transferred the seat of his government to Constantinople, and sought to win back the inhabitants by promising them the free exercise of their religion. He next reduced the kingdoms of Morea and Trebizond, offshoots of the Greek empire, obtained possession of Servia on the death of its last prince, and made formidable preparations for the invasion of Hungary. Belgrade was the first point of attack; and with 100,000 men, supported by a fleet of 200 ships on the Danube, M. sat down before its walls. The enormous ordnance which had done such good service at Constantinople, were employed to batter the ramparts; but the valor, skill, and activity of the defenders foiled his utmost efforts. John Hunyady (q. v.), who, with 6000 chosen troops, had reinforced the garrison, destroyed or captured all his vessels, and soon after, by a sudden sally, defeated his army, and carried off the battering-train, compelling him to raise the siege, 6th August, 1456. His next enterprise was the invasion of Epirus, where Scanderbeg had hitherto successfully defied the sultan's power. Three Turkish armies were destroyed in rapid succession, and a fourth and fifth under M. himself met with no greater success; but the death of the gallant Epirote, in 1467, removed the only obstacle to the success of the sultan's plans, and Epirus was forthwith annexed to Turkey. The latter half of M's reign was also fruitful in important achievements, but our space will permit only a cursory notice of them. He reduced the Khan of the Crimea to the condition of a vassal, deprived the Genoese of Caffa, and the Venetians of Friuli, Istrin, Negropont, and Lemnoe; but the Knights of St John repelled him from Rhodes, and the Venetians from Scodra. He carried his arms into Italy, and took Otranto, but died in 1481 at Nicomedian, while on the way to join his son Bajazet, who was warring with the Persians and Egyptians. His frequent contests with the former of these nations had always interfered very much with the successful prosecution of his designs of conquest in Europe. M. was possessed of great abilities; he was brave, enterprising, and sagacious; nor was he deficient in learning, for he spoke four languages fluently, was well versed in geography, ancient history, and the natural sciences, and was practically acquainted with the fine arts. But the brilliancy of his career, and the occasional generosity and even magnanimity which he shewed, cannot obliterate the recollection of those acts of cruelty and treachery which have justly branded him as the most ruthless tyrant of the House of Osman. As the founder of the Turkish power in Europe, his memory has always been revered by the Turks.

**MOHAMMEDANISM**, the religion founded by Mohammed, or, according to him, the only orthodox creed existing from the beginning of the world, and preached by all the prophets ever since Adam. It is also called *Islâm*, Resignation, entire Submission to the will and precepts of God. In its exclusively dogmatical or theoretical part, it is *Imân*, Faith; in its practical, *Dîn*, Religion (by way of eminence). The fundamental principles of the former are contained in the two articles of belief: "There is no God but God; and Mohammed is God's Apostle." The Mohammedan doctrine of God's nature and attributes coincides with the Christian, in so far as he is by both taught to be the Creator of all things in heaven and earth, who rules and preserves all things, without beginning, omnipotent, omniscient, omnipresent, and full of mercy. Yet, according to

the Mohammedan belief, he has no offspring: "He begetteth not, nor is he begotten." Nor is Jesus called anything but a prophet and apostle, although his birth is said to have been due to a miraculous divine operation; and as the Koran superseded the Gospel, so Mohammed, Christ. The crucifixion is said to have been executed upon another person, Christ having been taken up unto God before the decree was carried out. He will come again upon the earth, to establish everywhere the Moslem religion, and to be a sign of the coming of the day of judgment. Next to the belief in God, that in angels forms a prominent dogma. Created of fire, and endowed with a kind of incorporeal body, they stand between God and man, adoring or waiting upon the former, or interceding for and guarding the latter. The four chief angels are the "Holy Spirit," or "Angel of Revelations"—Gabriel; the special protector and guardian of the Jews—Michael; the "Angel of Death"—Azrael (Raphael, in the apocryphal gospel of Barnabas), and Israfil—Uriel, whose office it will be to sound the trumpet at the Resurrection. It will hardly be necessary, after what we said under MOHAMMED, to point out, in every individual instance, how most of his "religious" notions were taken almost bodily from the Jewish legends; his angelology, however, the Jews had borrowed themselves from the Persians, only altering the names, and, in a few cases, the offices of the chief angelic dignitaries. Besides angels, there are good and evil genii, the chief of the latter being Iblis (Despair), once called Azazel, who, refusing to pay homage to Adam, was rejected by God. These Jin are of a grosser fabric than angels, and subject to death. They, too, have different names and offices (Peri, Fairies; Div, Giants; Takvins, Fates, &c.), and are, in almost every respect, like the Shédim in the Talmud and Midrash. A further point of belief is that in certain God-given Scriptures, revealed successively to the different prophets. Four only of the original one hundred and four sacred books: viz., the Pentateuch, the Paulins, the Gospel, and the Koran, are said to have survived; the three former, however, in a mutilated and falsified condition. Besides these, a certain apocryphal gospel attributed to St Barnabas, and the writings of Daniel, together with those of a few other prophets, are taken notice of by the Moslems, but not as canonical books. The number of prophets sent at various times, is stated variously at between two and three hundred thousand, among whom 313 were apostles, and six were specially commissioned to proclaim new laws and dispensations, which abrogated the preceding ones. These were Adam, Noah, Abraham, Moses, Jesus, and Mohammed—the last greatest of them all, and the propagator of the final dispensation. The belief in the resurrection and the final judgment is the next article of faith. The dead are received in their graves by an angel announcing the coming of the two examiners, Monker, and Nakir, who put questions to the corpse respecting his belief in God and Mohammed, and who, in accordance with the answers, either torture or comfort him. This, again, is the Jewish "Chibbut hakkeber," the Beating of the Grave, a hyperbolical description of the sufferings during the intermediate state after death (purgatory). The soul, awaiting the general resurrection, enters according to its rank, either immediately into paradise (prophets), or partakes, in the shape of a green bird, of the delights of the abode of bliss (martyrs), or—in the case of common believers—is supposed either to stay near the grave, or to be with Adam in the lowest heaven, or to remain either in the well of Zem-Zem, or in the trumpet of the resurrection. According to others, it rests in the shape of a white bird under the throne of God. The souls of the infidels dwell in a certain well in the province of Hadramant (Heb. Chambers of Death), or, being first offered to heaven, then offered to earth, and rejected by either, subject to unspeakable tortures until the day of resurrection. Concerning the latter, great discrepancy reigns among the Mohammedan theologians. Mohammed himself seems to have held that both body and soul will be raised, and the "Bone Luz" of the Jewish Haggadah was by him transformed into the bone Al Ajb, the rump-bone, which will remain uncorrupted till the last day, and from which the whole body will spring anew, after a forty days' rain. Among the signs by which the approach of the last day may be known—nearly all taken from the legendary part of the Talmud and Midrash, where the signs of the coming of the Messiah are enumerated—are the decay of faith among men, the advancing of the meanest persons to highest dignities, wars, seditions, and tumults, and consequent dire distress, so that a man passing another's grave shall say: "Would to God I were in his place!" Certain provinces shall revolt, and the

buildings of Medina shall reach to Ynhâb. Again: the sun will rise in the west, the Beast will appear, Constantinople will be taken by the descendants of Isaac, the Anti-Christ will come, and be killed by Jesus at Lud. There will further take place a war with the Jews, Gog and Magog's (Jajug and Majuj's) eruption, a great smoke, an eclipse, the Mohammedans will return to idolatry, a great treasure will be found in the Euphrates, the Kaaba will be destroyed by the Ethiopians, beasts and inanimate things will speak, and finally, a wind will sweep away the souls of those who have faith, even if equal only to a grain of mustard seed, so that the world shall be left in ignorance. The time of the resurrection, even Mohammed could not learn from Gabriel; it is a mystery. Three blasts will announce it: that of consternation, of such terrible powers, that mothers shall neglect the babes on their breasts, and that heaven and earth will melt; that of examination, which will annihilate all things and beings, even the angel of death, save paradise and hell, and their inhabitants; and forty years later, that of resurrection, when all men, Mohammed first, shall have their souls breathed into their restored bodies, and will sleep in their sepulchres until the final doom has been passed upon them. The day of judgment, lasting from one to fifty thousand years, will call up angels, genii, men, and animals. The trial over, the righteous will enter paradise, to the right hand, and the wicked will pass to the left, into hell; both, however, have first to go over the bridge Al Sirât, laid over the midst of hell, and finer than a hair, and sharper than the edge of a sword, and beset with thorns on either side. The righteous will proceed on their path with ease and swiftness, but the wicked will fall down headlong to hell below—a place divided into seven stories or apartments, respectively assigned to Mohammedans, Jews, Christians, Sabians, Magians, idolaters, and—the lowest of all—to the hypocrites, who, outwardly professing a religion, in reality had none. The degrees of pain—chiefly consisting in intense heat and cold—vary; but the Mohammedans, and all those who professed the unity of God, will finally be released, while unbelievers and idolaters will be condemned to eternal punishment. Paradise is divided from hell by a partition (Orf), in which a certain number of half-saints will find place. The blessed, destined for the abodes of eternal delight (Jannat Aden, Heb. Gan Eden)—of which it is, however, not quite certain whether it is created already—will first drink of the Pond of the Prophet, which is supplied from the rivers of paradise, whiter than milk, and more odoriferous than musk. Arrived at one of the eight gates, they will be met by beautiful youths and angels; and their degree of righteousness (prophecy, religious teachers, martyrs, believers) will procure for them the corresponding degree of happiness. It may, however, not be superfluous to add, that, according to the Mohammedan doctrine, it is not a person's good works or merits which gain him admittance, but solely God's mercy; also that the poor will enter paradise five hundred years before the rich; and that the majority of the inhabitants of hell are women. As to the various felicities which await the pious (and of which there are about a hundred degrees), they are a wild conglomeration of Jewish, Christian, Magian, and other fancies on the subject, to which the Prophet's own exceedingly sensual imagination has added very considerably. Feasting in the most gorgeous and delicious variety, the most costly and brilliant garments, odors and music of the most ravishing nature, and above all, the enjoyment of the Hûr Al Oÿn, the black-eyed daughters of paradise, created of pure musk, and free from all the bodily weaknesses of the female sex, are held out as a reward to the commonest inhabitants of paradise, who will always remain in the full vigor of their youth and manhood.\* For those deserving a higher degree of recompense, rewards will be prepared of a purely spiritual kind—i.e., the "beholding of God's face" (Shechluah) by night and by day. A separate abode of happiness will also be reserved for women, but there is considerable doubt as to the manner of their enjoyment. That they are not of a prominently spiritual

\* "The whole earth will be as one loaf of bread, which God will reach to them like a cake; for meat they will have the ox Bâlm and the fish Nûn, the lobes of whose livers will suffice seventy thousand men. Every believer will have eighty thousand servants and seventy-two girls of paradise, besides his own former wives, if he should wish for these, and a large tent of pearls, jacinths, and emeralds: three hundred dishes of gold shall be set before each guest at once, and the last morsel will be as grateful as the first. Wine will be permitted, and will flow copiously,

nature, is clear from the story of the Prophet and the old woman. The latter solicited Mohammed to intercede with God that she might be admitted into paradise, whereupon he replied that old women were not allowed in paradise, which dictum—causing her to weep—he further explained by saying that they would first be made young again. The last of the precepts of pure faith taught by Mohammedanism is the full and unconditional submission to God's decree (ISLAM), and the predestination of good and evil, which is found from the beginning inscribed on a "preserved tablet." Not only a man's fortunes, but his deeds, and consequently his future reward or punishment, are irrevocably, and thus unavoidably, pre-ordained (Fate): a doctrine which is not, however, taken literally by *all* Moslems, but which has no doubt contributed largely to the success of Islam, by inspiring its champions with the greatest indifference and contempt for the dangers of warfare; their destiny being immutably fixed under any circumstances.

Thus far, briefly, the Iman, dogmatical or theoretical part of Islam. The Din, or practical part, which contains the ritual and moral laws, incites as the chief duties the following four: prayer, alms-giving, fasting, and pilgrimage.

Prayer, "the key of paradise," comprises also certain religious purifications, as the most necessary preparations to the former. They are of two kinds: the *Ghusl*, or total immersion of the body, required as a religious ceremony, on some special occasions; and the *Wudu*, a partial ablution, to be performed immediately before the prayer. This is of primary importance, and consists of the washing of hands, face, ears, and feet up to the ankles—a proceeding generally accompanied at each stage by corresponding pious sentences, and concluded by the recital of the 97th chapter of the Koran. In the case of water being beyond reach, dry dust or sand may supply its place. "The practice of religion being founded on cleanliness," it is not sufficient that the believer himself should be purified, but even the ground or the carpet upon which he prays must be as clean as possible, and the use of a special prayer-carpet (*Seggadah*) is therefore recommended. Every Mohammedan is obliged to pray five times in the space of every twenty-four hours. The prayer (*Salah*) itself consists partly of extracts from the Revealed Book, the Koran (*Fard*), partly of pieces ordained by the Prophet without allegation of a divine order (*Sunnah*). The first time of prayer commences at the Maghrib, or about sunset; the second at the Eshâ, or nightfall; the third, at the Subh, or daybreak; the fourth, at the Duhr, or about noon; the fifth, at the Aar, or afternoon. The believers are not to commence their prayers exactly at sunrise, or noon, or sunset, lest they might be confounded with the infidel Sunn-worshippers. These several times of prayer are announced by the Muëddis (q. v.) from the minarets or madnehs of the mosques. Their chant, sung to a very simple but solemn melody, sounds harmoniously and sonorously down the height of the mosque, through the mid-day din and roar of the cities, but its impression is one of the most strikingly poetical in the stillness of night; so much so, that even many Europeans cannot help congratulating the Prophet on his preferring the human voice to either the Jewish trumpet-call of the time of the Temple, or the Christian church-bells. The day-call (the *Adan*) consists chiefly of the confession of faith (God is most great—Mohammed is God's apostle—come to prayer, come to security) repeated several times; the night-calls (*Uia*, the first; *Ebed*, the second), destined for persons who desire to perform supererogatory acts of devotion, are much longer. The believer often changes his posture during his prayers, and a certain number of such inclinations of head and knees, prostrations, &c., is called a *Rekah*. It is also necessary that the face of the worshipper should be turned towards the Kibleh, in the direction of Mecca (q. v.), the exterior wall of the mosque marking that direction being distinguished by a niche (*Mehrab*). All sumptuous and pompous apparel is laid aside before the believer approaches the sacred place; and the extreme solemn-

without inebriating. The righteous will be clothed in the most precious silks and gold, and will be crowned with crowns of the most resplendent pearls and jewels. If they desire children, they shall beget them, and see them grow up within an hour. Besides the ravishing songs of the angel Israfil and the daughters of paradise, the very trees will, by the rustling of their boughs, the clanging of bells suspended from them, and the clashing of their fruits, which are pearls and emeralds, make sweetest music."

nity and decorum, the unaffected humility, the real and all-absorbing devotion which pervades it, have been unanimously held up as an example to other creeds. Women, although not strictly forbidden to enter the mosque, yet are not practically allowed to pray there, lest their presence might be hurtful to true devotion. Besides these prayers, there are others ordained for special occasions, as on a pilgrimage, before a battle, at funerals, during an eclipse, &c. That the Moslems do not pray to Mohammed, but simply implore his intercession, as they do that of the numerous saints, the relatives of the Prophet, and the first propagators of Islam, need, after what we said under MOHAMMED, not be dwelt upon here. For the particulars of the service in the Mosque, the reader is referred to that heading. It may be remarked in passing, that Mohammedanism has no clergy in our sense of the word, the civil and religious law being bound up in one. See also MOLLAH, MUFTI.

Next in importance stands the duty of giving alms. There are twofold—legal (*Zekah*) and voluntary (*Sadakah*; Heb. *Zedakah*, plety, righteousness); but the former, once collected by the sovereign, and applied to pious uses, has now been practically abrogated. The *Sadakah* is, according to the law, to be given once every year, of cattle, money, corn, fruits, and wares sold, at about the rate of from two and a half up to twenty per cent. Besides these, it is usual to bestow a measure of provisions upon the poor, at the end of the sacred month of Ramadan.

The duty of fasting follows. [*Fasts*.] During the whole month of Ramadan, the Moslem is commanded to refrain from eating, drinking, smoking, smelling perfume, bathing, and every unnecessary indulgence in worldly pleasure, from day-break until sunset. From that period till the morning, he is allowed to eat, drink, and enjoy himself. The Arabian years being lunar, it often happens that the Ramadan falls in midsummer, when the fasting, more especially the abstaining from drinking, is excessively mortifying. None are exempt from this duty save the sick, travellers, and soldiers in time of war; but they are bound to fast an equal number of days during some other months. Nurses and pregnant women are entirely free from fasting. It is Mohammed's special and express desire, that no one should fast who is not quite equal to it, lest he might injure his health, and disqualify himself for necessary labor. Of the other commendable fast-days, the *Ashura*, on the 10th of Moharram (the Jewish *Yom Kippur*), deserves special mention. There are very few Moslems who do not keep the Ramadan, even if they neglect their other religious duties; at all events, they all pretend to keep it most strictly, fasting being considered "one-fourth part of the faith," nay, "the gate of religion."

Of the fourth paramount duty of the Mohammedan—viz., the pilgrimage to Mecca—we have spoken both under that heading, and, more fully, in the article *HAJJ*. Suffice it here briefly to recapitulate, that the *Kaaba* (q. v.) is to be encompassed seven times, the celebrated black stone being kissed at each round, that Mount Arafat is to be visited, the sacrifice *El-Fida* (the Ransom, in memory of Isaac's sacrifice) to be performed, and a number of minor ceremonies to be gone through by the pilgrim, and that he who neglects to perform the sacred pilgrimage, "might as well die a Jew or a Christian."

To the "positive" ordinances of Islam may also be reckoned the "*Saghir*," or minor, and "*Kehir*," or great festivals, [*Festivals*.] The first (*Al-Fetr*, or breaking the fast), following immediately upon the Ramadan, begins on the first day of the month of Shawal, and lasts three days. The second (*Eed Al-Kurban*, or sacrifice) begins on the 10th of *Dhu'l Heggah*, when the pilgrims perform their sacrifice, and lasts three or four days. Yet, although intended to be the most important of the two, the people have in most places changed the order, and by way of compensation for the previous fast, they make the lesser festival which follows the Ramadan the most joyful and the longest of the two. The day set aside for the weekly day of rest is the Friday—not, as is generally supposed, because both the Jewish Sabbath and the Christian Sunday were to be avoided, but because, from times long before Mohammed, the people used to hold public assemblies for civil as well as religious purposes on that day. The celebration of the Moslem day of religious solemnity is far less strict than is the custom with the other Semic religions. Service being over, the people are allowed to return to their worldly affairs, if they cannot afford to give themselves up entirely to pleasure or devotion for the rest of the sacred period.

Thus far, briefly, the principal positive laws of Islam relating to faith and practice. We shall now touch upon the fundamental prohibitory laws contained in the Koran.

First of all, the drinking of wine, which includes all strong and inebriating liquors, as giving rise to "more evil than good," is rigorously forbidden; and although of late, chiefly through European influence, very many Moslems have lost their religious scruples on that score, and not only secretly, but openly indulge in spirits, yet the great bulk of the faithful refuse even to make use of the proceeds of the sale of wine or grapes. Some over-scrupulous believers even include opium, coffee, and tobacco in the prohibition; but general practice has decided differently. The prohibitory laws respecting food resemble closely those of Judaism: blood, the flesh of swine, further, animals which have died from disease or age, or on which the name of some idol has been invoked, or which have been sacrificed unto an idol, or which have been strangled or killed by a blow, a fall, or by some other beast, are strictly forbidden. "Pure" animals must be slaughtered according to certain fixed rules, and the name of God is to be invoked before the operation, without, however, the usual addition of the benevolent epithets, since these would ill befit the sufferings of a fellow-creature. Fish, birds, game are mostly allowed for food, yet there are in nearly all cases certain religious ceremonies to be observed, before they become fit for the believer's table.

All games subject to chance ("casting lots by arrows")—such as dice, cards, tables, bets, &c.—are considered so wicked, that a gambler's testimony is invalid in a court of law. (The Talmud only rejects the testimony of the habitual "*dice*." [Kabbia, i. e., Cube] gambler and better upon doves.") Chess and other games depending on skill—provided they do not interfere with the regular performance of religious duties, and that they are played without any stakes whatsoever—are allowed by the majority of Moslem theologians. Usury is strictly prohibited. Taking interest upon any loan, however large or small, or profiting in trade through any questionable means, save by buying and selling, is severely condemned.

To prevent the faithful from ever falling back into idolatry, the laws relating to images and pictures have been made very stringent. Whosoever makes an imitation of any living being in stone, wood, or any other material, shall, on the day of judgment, be asked to endow his creation with life and soul, and, on his protesting his inability of doing so, shall undergo the punishment of hell for a certain period.

The civil and criminal laws of Mohammedanism, founded both on the Koran and the Traditions (*Sunna*), are, in some instances, where the letter of the written or oral precept allows of various explanations, or where the case in question is not foreseen, interpreted according to the opinion of one of the four great masters of Islam: Abu Hanifa, Malec Ibn Ans, Shâfi, Ibn Hanbal, within the pale of their respective sects. The principal points, however, upon which all Mohammedans agree are the following: Polygamy is allowed, not, as is commonly supposed, without any restriction, but: "Take in marriage of the women who please you, two, three, or four; but if ye fear that ye cannot act equitably, one; or those whom your right hands have acquired"—i. e., your slaves. These are the explicit words of the Koran (iv. 3), so that four wives, and a certain number of concubine slaves, is the whole extent to which a Moslem may legally go. The Prophet's example proves nothing to the contrary, since he was endowed with special privileges, and not subject to the common law in many respects. It is, moreover, added, as an advice, that to marry one or two is quite sufficient for a man, if he apprehend any inconvenience from a larger number of wives. A Moslem may, if urged by excessive love, or if unable to obtain a wife of his own creed, marry a Christian woman or a Jewess, but a Mohammedan woman is not, under any circumstances, to marry an unbeliever. In all cases, however, the child born of a Moslem, whatever the mother's faith, is a Moslem; nor does the wife, who is an unbeliever, inherit at her husband's death. Forbidden degrees are: the mother, daughter, sister, half-sister, aunt, niece, foster-mother, or a woman related to the faithful "by milk in any of the degrees which would preclude his marriage with her, if she were similarly related to him by consanguinity;" the mother of his wife, even if he be not properly married to the latter yet; the daughter of his wife, if the latter still be his legal wife; his father's wife and his son's wife; or two sisters at the same time; or wives who stand to each other in the relation of aunt and niece;

or the unemancipated slave, or another man's slave, if he have already a free wife. A simple declaration of a man and woman at the age of puberty, before two witnesses, of their intention to marry each other, and the payment of part of the dowry (which is indispensable, and must amount to at least ten dirhems, or about five shillings), is sufficient for a legal marriage. A girl under age is given away by her natural or appointed guardian, with or without her consent. To see the face of any woman who is neither his wife nor his concubine, nor belongs to any of the forbidden degrees, is strictly forbidden to the believer. Divorce is a comparatively light matter with the Mohammedans. Twice, a man may send away his wife and take her back again without any ceremony; the third time, however—if he unite the triple divorce in one sentence at once—he dare not receive her again in wedlock until she have been married properly to another man in the meantime. Mere dislike is sufficient reason for a man to dissolve the conjugal ties, and his saying: "Thou art divorced," or "I divorce thee," together with the payment of part of the wife's dowry, is all that is required from him by the law. A wife, on the other hand, is bound to her husband for ever, unless she can prove some flagrant ill-usage or neglect of conjugal duty on his part; and even then, she forfeits part, or the whole of her dowry. A divorced woman is obliged to wait, like a widow, for a certain period before marrying again: if pregnant, until delivery; three months, or four months and ten days, according to circumstances. If she have a young child, she is to suckle it until it be two years old, and the father is to bear all the expenses of the maintenance of mother and child. A woman proving disobedient to her husband, may be declared by the kadi "nāshizeh," i. e., rebellious, and the husband is no longer bound to maintain her. Yet, he cannot be forced to divorce her under these circumstances, so that the woman is generally in so sore a plight that she is obliged to promise good-behavior for the future, and the husband has then either to take her back to his house, or to set her free by a formal divorce. On the other hand, it often happens that a woman prefers a mere separation, to continuing to live with her husband; in which case she gets herself, of her own accord, inscribed a "nāshizeh." If a slave becomes a mother by her master, and he acknowledges the child to be his own, the latter is free, and the mother is to be emancipated at the master's death, and may not be given away, or otherwise disposed of by him, during his lifetime. A free person, wishing to marry his or her slave, must first emancipate this slave; and if the slave of another person has been married by a free man or woman, and afterwards becomes the latter's property, the marriage becomes illegal, and can only be renewed by a legal contract and emancipation.

The privilege of primogeniture does not exist in the Mohammedan law, but males generally receive a double share. A person may not bequeath more than one-third of his property, unless there be no legal heirs. Children, whether begotten with the legal wife, or slave, or concubine, or only adopted, and their descendants, are the first heirs; next come the claims of wives, parents, brothers, sisters, in their order. When there is no legal heir, the property falls to the crown.

The law is very lenient towards debtors, the Koran recommending the creditor to remit a debt "as alms." Insolvency and inability to work for the discharge of the claim, solve all further obligations. The most conscientious performance of all private contracts, however, is constantly recommended in the Koran.

Murder is either punished with death, or by the payment of a fine to the family of the deceased, according to their own pleasure. There must, however, be palliating circumstances in the latter case. The Bedawis, however, have expanded the law of blood-revenge in a terrible manner, and up to this day the "vendetta" often rages not only between family and family, but between whole tribes, villages, and provinces. Unintentional homicide is expiated by freeing a believer from slavery, and paying to the family a certain sum in proportion to the rank and sex of the deceased. He who has not the means of freeing a believer, is to fast for two months, by way of penance. According to the strict letter of the law, a man is not liable to capital punishment for killing his own child or an infidel; but, practically, no difference is generally made by the Mohammedan governments (chiefly the Turkish) in our day. Murder is punished with death, and no fine frees the culprit.

The Mosaic law of retaliation, in case of intentional wounds and mutilation, holds good also for Islam; that is (not, as has ignorantly been supposed, that the

corresponding limb of the offender is to be cut off, a certain proportionate fine in money is to be paid to the injured. The payment for any of the single limbs of the human body—e. g., the nose—is the full price of blood, as for a homicide; for a limb which is found twice, like hand or foot, half; for a finger or toe, the tenth part, &c. Women and slaves have smaller claims. Injuries of a dangerous, or otherwise grievous nature, pay the full price; those of an inferior kind, however, bring the perpetrator within the province of the lash or cudgel, which is supposed to have “come down from heaven, to be used by the judge for the promotion of virtue and duty.”

The Koran orders theft—of no less than the value of half-a-crown—to be punished by cutting off the chief offending limb: the right hand; the second theft is punishable by the loss of the left foot; the third, of the left hand; the fourth, of the right foot, &c.; but the ordinary punishments of imprisonment, hard labor, and the bastinado, have been substituted in our days. The property stolen must not, however, have been of easy access to the thief, nor must it have consisted of food, since he may have taken this to satisfy the craving of his hunger.

Unchastity on the part of a woman was, in the commencement of Islam, punished by imprisonment for life, for which afterwards, however, stoning was substituted in the case of a married woman; and a hundred stripes and a year's exile in the case of an unmarried free woman; a slave to undergo only half of that punishment. Yet, it is necessary that he who accuses a “woman of reputation” of adultery or fornication, shall produce four (male) witnesses, and if he be not able to do so, he is to receive fourscore stripes, nor is his testimony ever after to be received, for he is considered an “infamous prevaricator”—unless he swear four times that he speaks the truth, and the fifth time imprecate God's vengeance if he speak false. Yet, even this testimony may be overthrown by the wife's swearing four times that he is a liar, and imprecating the fifth time the wrath of God upon herself, if he speak the truth. In the latter case, she is free from punishment; the marriage, however, is to be dissolved. Fornication in either sex is, by the law of the Koran, to be visited with a hundred stripes.

Infidelity, or apostasy from Islam, is a crime to be visited by the death of the offender, if he have been warned thrice without recanting. Severer still, that is, not to be averted by repentance or revocation of any kind, is the punishment inflicted for blasphemy—against God, Mohammed, Christ, Moses, or any other prophet. Instantaneous death is the doom of the offender; for if apostasy may be caused by error and misguidance, “blasphemy is the sign of complete wickedness and thorough corruption of the soul.”

A further injunction of the Koran, for the carrying out of which, however, the time has well-nigh gone by, is that of making war against the Infidels. He who is slain while fighting in defence and for the propagation of Islam, is reckoned a martyr; while a deserter from the holy war is held up as an object of execration, and has forfeited his life in this world as well as in the world to come. At first, all the enemies taken in battle were ruthlessly slain; later, however, it became the law to give the people of a different faith against whom war was declared the choice of three things: either to embrace Islam—in which case they became Moslems at once, free in their persons and fortunes, and entitled to all the privileges of Moslems; or to submit to pay tribute—in which case they were allowed to continue in their religion, if it did not imply gross idolatry or otherwise offended against the moral law; or to decide the quarrel by the fortune of war—in which case the captive women and children were made slaves, and the men either slain, unless they became converts at the last moment, or otherwise disposed of by the prince. The fifth part of the spoil belongs “to God,” that is, the Sanctuary (Kaaba, &c.), to the apostle and his kindred, to the orphans, the poor, and the traveller.

We need hardly urge, that the Koran is not a systematically arranged code, and that all the laws and regulations hitherto enumerated, although contained in it, either bodily, or, as it were, in germs—further developed by the Sunna (q. v.)—are to a great extent only mentioned in an incidental manner, thrown together and mixed up, often in the strangest manner, with the most heterogeneous dicta, dogmas, moral exhortations, civil and criminal laws, &c., and are principally to be considered as supplementary to the existing laws and regulations which they either abrogated, confirmed or extended, according to the pressing demand of circumstances during

the Prophet's life. In cases for which subsequent ages found no written rules laid down by the Prophet, traditional oral dicta were taken as the norm, and later still, precedents of the Khalifs were binding. Hence contradictions in theory and practice have crept in, according to the different traditions and decisions of the Imams or expounders of the Law, besides the various interpretations put upon the book itself within the pale of the different Mohammedan sects. The secular tribunals, therefore, not unfrequently differ in their decisions from the judicial tribunals; and the distinction between the written civil Law of the ecclesiastical courts and the common Law, aided by the executive power, is, fortunately for the cause of human culture, and the spread of civilisation, getting clearer and clearer every day.

That part of Islam, however, which has undergone (because not to be circumscribed and defined by doctors) the least changes in the course of time, and which most distinctly reveals the mind of its author, is also its most complete and its most shining part—we mean the ethics of the Koran. They are not found, any more than the other laws, brought together in one, or two, or three Surahs, but “like golden threads” they are woven into the huge fabric of the religious constitution of Mohammed. Injustice, falsehood, pride, revengefulness, calumny, mockery, avarice, prodigality, debauchery, mistrust, and suspicion are inveighed against as ungodly and wicked; while benevolence, liberality, modesty, forbearance, patience and endurance, frugality, sincerity, straightforwardness, decency, love of peace and truth, and above all, trusting in God, and submitting to his will, are considered as the pillars of true piety, and the principal signs of a true believer. Nor must we omit to point out expressly that Mohammed never laid down that doctrine of absolute predestination and “fatality” which destroys all human will and freedom, since the individual's deeds cannot alter one iota in his destiny either in this world or in the next. So far from it, foolhardiness is distinctly prohibited in the Koran (ii. 196). Caution is recommended. Prayer, the highest ceremonial law of Islam, is modified in case of danger. It is legal to earn one's livelihood on Friday after prayer, and to shorten the readings in the Koran for the sake of attending to business. All of which is enough to shew that the Moslem is not to expect to be fed pursuant to a Divine decree whether he be idle or not. On the other hand, a glance at the whole system of faith, built on hope and fear, rewards and punishments, paradise and hell, both to be man's portion according to his acts in this life, and the incessant exhortations to virtue, and denunciations of vice, are sufficient to prove that aboriginal predestination, such as St Augustine taught it is not in the Koran, where only submission to the Lord's will, hope during misfortune, modesty in prosperity, and entire confidence in the Divine plans, are supported by the argument, that everything is in the hands of the Highest Being, and that there is no appeal against His absolute decrees.

And this is one instance of the way in which most of Mohammed's dicta have been developed and explained—both by sectarians and enemies within and without Islam—in such a manner that he has often been made to teach the very reverse of what he really did teach; and thus monstrosities now found in his creed, if carefully traced back to their original sources, will, in most cases, be seen to be the growth of later generations, or the very things he abrogated. That, again, the worst side of his character, the often wanton cruelty with which he pursued his great mission, the propagation of his faith, should by his successors have been taken as a thing to be principally imitated, is not to be wondered at, considering how brilliant the results of the policy of the bloody sword had proved. Scarcely a century had elapsed after Mohammed's death, and Islam reigned supreme over Arabia, Syria, Persia, Egypt, the whole of the northern coast of Africa, even as far as Spain; and notwithstanding the subsequent strifes and divisions in the interior of this gigantic realm, it grew and grew outwardly, until the Crescent was made to gleam from the spires of St Sophia at Constantinople, and the war-cry “Allah il Allah!” resounded before the gates of Vienna. From that time, however, the splendor and the power of Mohammedanism began to wane. Although there are counted about 150 millions this day all over the globe who profess Islam, and although it is, especially at this present juncture, making great progress among the African races, yet the number of real and thorough believers is infinitely small; and since it has left off conquering, it has lost also that energy and elasticity which promises great things. Its future fate will depend chiefly, we should say, on the progress of Eu-

ropean conquest in the East, and the amount of Western civilisation which it will, for good or evil, import into those parts.

We cannot consider in this place what Islam has done for the cause of all humanity, or, more exactly, what was his precise share in the development of science and art in Europe. We refer to the special articles which treat of these subjects, and particularly to the biographies found in the course of this work of men eminent in every branch of human knowledge who have issued from the ranks of Islam. Broadly speaking, the Mohammedans may be said to have been the enlightened teachers of barbarous Europe from the 9th to the 13th century. It is from the glorious days of the Abbasside rulers that the real renaissance of Greek spirit and Greek culture is to be dated. Classical literature would have been irredeemably lost, had it not been for the home it found in the schools of the "unbelievers" of the "dark ages." Arabic philosophy, medicine, natural history, geography, history, grammar, rhetoric, and the "golden art of poetry," schooled by the old Hellenic masters, brought forth an abundant harvest of works, many of which will live and teach as long as there will be generations to be taught.

Besides the Koran, the Sunna, and the native (Arabic, Persian, Turkish, &c.) writers on the foregoing subject, we mention as further references the works of the European scholars Maracci, Hyde, Prideaux, Chardin, Du Ryer, Reland, D'Herbelot, Sale, De Sacy, Hammer, Burckhardt, Sprenger, Burton, Muir, Garcin de Tassy, Lane, Weil, Geiger, Nöldeke. See KORAN, MAHOMMED, SHITES, SHAFITES, SUNNA.

**MOHAMMEDAN SECTS.** "My community," Mohammed is reported to have said, "will separate itself into seventy-three sects; one only will be saved, all the others shall perish." This prophecy has been largely fulfilled. Even during the illness, and immediately after the death of the founder, many differences of opinion arose among his earliest adherents. We have endeavored to shew both under KORAN and MOHAMMEDANISM, how the fundamental book of Islam left certain points undecided by the very fact of its poetical wording, and how, further, the peculiarity of the Arabic idiom at times allowed many interpretations to be put upon one cardinal and dogmatic sentence. To add to this uncertainty, a vast number of oral traditions sprang up and circulated as an expansive corollary to the Koran. Political causes soon came to assist the confusion and contest, and religion was made the pretext for faction-fights, which in reality had their origin in the ambition of certain men of influence. Thus "sects" increased in far larger number even than the Prophet had foretold, and though their existence was but short-lived in most instances, they yet deserve attention, were it only as signs and tokens of the ever-fresh life of the human spirit, which, though fettered a thousand times by narrow and hard formulas, will break these fetters as often, and prove its everlasting right to freedom of thought and action.

The bewildering mass of these currents of controversy, has by the Arabic historians been brought under four chief heads or fundamental bases. The first of these relates to the divine attributes and unity. Which of these attributes are essential or eternal? Is the omnipotence of God absolute? If not, what are its limits? Further, as to the doctrine of God's predestination and man's liberty—a question of no small purport, and one which has been controverted in nearly all "revealed" religions—How far is God's decree influenced by man's own will? How far can God countenance evil? and questions of a similar kind belonging to this province. The third is perhaps the most comprehensive "basis," and the one that bears most directly upon practical doctrines—viz., the promises and threats, and the names of God, together with various other questions chiefly relating to faith, repentance, infidelity, and error. The fourth is the one that concerns itself with the influence of reason and history upon the transcendental realm of faith. To this chapter belong the mission of prophets, the office of Imam, or Head of the Church, and such intricate subtleties as to what constitutes goodness and badness; how far actions are to be condemned on the ground of reason or the "Law;" &c.

One broad line, however, came to be drawn, in the course of time, among these innumerable religious divisions, a line that separated them all into orthodox sects and heterodox sects; orthodox being those only who adopted the oral traditions, or Sunna (see SUNNITES).

Much more numerous than the orthodox divisions are the heterodox ones. Immediately after Mohammed's death, and during the early conquests, the contest was chiefly confined to the question of the Imamate. But no sooner were the first days of warfare over, than thinking minds began to direct themselves to a closer examination of the faith itself, for which and through which the world was to be conquered, and to the book which preached it, the Koran. The earliest germs of a religious dissension are found in the revolt of the Kharejites against Ali, in the 37th year of the Hedjrah; and several doctors shortly afterwards broached heterodox opinions about predestination and the good and evil to be ascribed to God. These new doctrines were boldly, and in a very advanced form, openly preached by Wâsil Ibn Atâ, who, for uttering a moderate opinion in the matter of the "sinner," had been expelled from the rigorous school of Baâra. He then formed a school of his own—that of the Separatists or Motazilites (q. v.), who, together with a number of other "heretical" groups, are variously counted as one, four, or seven sects.

We now come to the second great heretic group, the Sefatians. The Sefatians (attributionists) held a precisely contrary view to that of the Motazilites. With them, God's attributes, whether essential or operative, or what they afterwards called declarative or historical, i. e., used in historical narration (eyes, face, hand), anthropomorphisms, in fact, were considered eternal. But here, again, lay the germs for more dissensions and more sects in their own midst. Some taking this notion of God's attributes in a strictly literal sense, assumed a likeness between God and created things; others giving it a more allegorical interpretation, without, however, entering into any particulars beyond the reiterated doctrine, that God had no companion or similitude. The different sects into which they split were, first, the Aesharians, so called from Abul Hasan al Ashari, who, at first a Motazilite, disagreed with his masters on the point of God's being bound to do always that which is best. He became the founder of a new school, which held (1) that God's attributes are to be held distinct from his essence, and that any literal understanding of the words that stand for God's limbs in the Koran is reprehensible. (2) That predestination must be taken in its most literal meaning, i. e., that God preordains everything. The opinions on this point of man's free will are, however, much divided, as indeed to combine a predestination which ordains every act with man's free choice is not easy; and the older authors hold it as well not to inquire too minutely into these things, lest all precepts, both positive and negative, be argued away. The middle path, adopted by the greater number of the doctors, is expressed in this formula: There is neither compulsion nor free liberty, but the way lies between the two; the power and will being both created by God, though the merit or guilt be imputed to man. Regarding mortal sin, it was held by this sect, that if a believer die guilty of it without repentance, he will not, for all that, always remain a denizen of hell. God will either pardon him, or the Prophet will intercede on his behalf, as he says in the Koran: "My intercession shall be employed for those among my people who shall have been guilty of grievous crimes;" and further, that he in whose heart there is faith but of the weight of an ant, shall be delivered from hell-fire. From this more philosophical opinion, however, departed a number of other Sefatian sects, who, taking the Koranic words more literally, transformed God's attributes into grossly corporeal things, like the Mosshabehites, or Assimilators, who conceived God to be a figure composed of limbs like those of created beings, either of a bodily or spiritual nature, capable of local motion, ascent, or descent, &c. The notions of some actually went so far as to declare God to be "hollow from the crown of the head to the breast, and solid from the breast downward; he also had black curled hair." Another sub-division of this sect were the Jabarians, who deny to man all free agency, and make all his deeds dependent on God. Their name indicates their religious tendency sufficiently, meaning "Necessitarians."

The third principal division of "heretical sects" is formed by the Kharejites, or "Rebels" from the lawful Prince—i. e., Ali—the first of whom were the 12,000 men who fell away from him after having fought under him at the battle of Seffeln, taking offence at his submitting the decision of his right to the califate (against Moawiyah) to arbitration. Their "heresy" consisted, first, in their holding that any man might be called to the Imamate though he did not belong to the Koreish, nor was even a freeman, provided he was a just and pious man, and fit in every other respect. It also followed that an unrighteous Imam might be deposed, or

**Mohawk**  
**Moh'ter**

164

even put to death; and further, that there was no absolute necessity for any Imam in the world.

Of the fourth principal sect, the Shītes, or "Sectaries," the followers of Ali Ibn Abi Tāleb, we have spoken under that special heading.

It remains only to mention a few of the many pseudo-prophets who arose from time to time in the bosom of Islam, drawing a certain number of adherents around them, and threatening to undermine the church founded by Mohammed, by either declaring themselves his legal successors, or completely renouncing his doctrines. The first and most prominent among these, was Mosaylima (q. v.). Next to him stands Al-Aswad, originally called Ashala, of the tribe of Ans, of which, as well as of that of a number of other tribes, he was governor. He pretended to receive certain revelations from two angels, Sohaik and Shoralk. Certain feats of legerdemain, and a natural eloquence, procured him a number of followers, by whose aid he made himself master of several provinces. A counter-revolution, however, broke out the night before Mohammed's death, and Al-Aswad's head was cut off; whereby an end was put to a rebellion of exactly four months' duration, but already assuming large proportions. In the same year (11 Hedjrah), but after Mohammed's death, a man named Toleha set up as prophet, but with very little success. He, his tribe, and followers were met in open battle by Khalid, at the head of the troops of the Faithful, and being beaten, had all finally to submit to Islam.

A few words ought also to be said regarding the "Velled Prophet," Al-Mokanna, or Borkal, whose real name was Hakem Ibn Hashem, at the time of Al-Mohdi, the third Abbaside calif. He used to hide the deformity of his face (he had also but one eye) by a gilded mask, a circumstance which his followers explained by the splendor of his countenance being too brilliant (like that of Moses) to be borne by ordinary mortals. Being a proficient in jugglery besides, which went for the power of working miracles, he soon drew many disciples and followers around him. At last he arrogated the office of the Deity itself, which by continual transmigrations from Adam downwards, had at last resided in the body of Abu Moslem, the governor of Khorassan, whose secretary this new prophet had been. The calif, finding him growing more and more formidable every day, sent a force against him, which finally drove him back into one of his strongest fortresses, where he first poisoned and then burned all his family; after which he threw himself into the flames, which consumed him completely, except his hair. He had left a message, however, to the effect that he would reappear in the shape of a gray man riding on a gray beast, and many of his followers for many years after expected his reappearance. They wore, as a distinguishing mark, nothing but white garments. He died about the middle of the 3d c. Hedjrah.

Of the Karmathians and the Ismailis, we have spoken under these special headings. We can scarcely enumerate among the prophets Abul Teyeb Ahmed Al-Motanebbi, one of the most celebrated Arabic poets, who mistook, or pretended to mistake, his poetical inspirations for the divine afflatus, and caused several tribes to style him prophet, as his surname indicates, and to acknowledge his mission. The governor of his province, Lâli, took the promptest steps to stifle any such pretensions in the bud, by imprisoning him, and making him formally renounce all absurd pretensions to a prophetic office. The poet did so with all speed. He was richly rewarded by the court and many princes for his minstrelsy, to which henceforth he clung exclusively; but the riches he thus accumulated became the cause of his death. Robbers attacked him while he was returning to his home in Kufa, there to live upon the treasure bestowed upon him by Adado'ddawla, Sultan of Persia.—The last of these new prophets to be mentioned is Baba, who appeared in Anasias, in Natolia, in 638 Hedjrah, and who had immense success, chiefly with the Turks, his own nation, so that at last he found himself at the head of nearly a million men, horse and foot. Their war-cry was, God is God, and Baba—not Mohammed—is his prophet. It was not until both Christians and Mohammedans combined for the purpose of self-defence, that this new and most formidable power was annihilated, its armies being routed and put to the sword, while the two chiefs were decapitated by the executioner.

**MO'HAWK**, a river of New York, United States, named from a tribe of Indians. It rises in Onondaga county, 20 miles north of Rome, and runs east-south-east into the

Hudson at Waterford, 10 miles above Albany. It is 135 miles long, and has numerous and picturesque waterfalls, especially at Little Falls, Cohoes, and Waterford, affording abundant water-power. In its populous valley are the Erie Canal and New York Central Railway.

**MOHICANS**, Mohegans, or Mahicans, once a powerful and warlike sun-tribe of North American Indians, of the great Algonquin family, which in the 17th c. inhabited the territory north-north-west of Long Island Sound, and east of the river Hudson, now included in the states of New York, Connecticut, and Massachusetts. Being compelled to give way to the conquering Iroquois confederacy, they retired to the valley of the Housatonic River in Connecticut, and were consequently one of the first tribes who came into collision with, and were dispossessed of their territory by the early British settlers. They subsequently lived dispersed among the other tribes, and all traces of them have now nearly disappeared. Their name has become widely known through Mr J. Fenimore Cooper's celebrated novel, "*The Last of the Mohicans*."

**MOHILEV**, or Mogilev, a government of European Russia, lying between Minsk and Smolensk, contains 18,500 English square miles, with a pop. (1870) of 947,625. The inhabitants are mostly Russians, though there are also many Russians, Germans, Jews, and even Bohemians. The country is generally a plain, with here and there an occasional undulation; the soil is very fertile, and the climate most agreeably mild. Agriculture has here reached a high degree of perfection, and the same may be said of arboriculture and horticulture. The natural pasturage is of fine quality, and affords abundant nourishment to immense herds of cattle. The forests are extensive. The country is watered by the Dnieper and its numerous affluents, which form the means of communication with the Black Sea ports, and of the transit of corn, timber, and masts, of which last large quantities are annually floated down to Kherson. Bog iron-ore is found in abundance. The inhabitants are celebrated for their activity and industry; and M., from its great natural advantages, has now become one of the richest provinces of Russia.

In early times, M. belonged to the territory of the Russian prince of Smolensk, but was subsequently conquered by the Grand Duke of Lithuania, and was, along with Lithuania, united to the kingdom of Poland. In 1773, it was seized by Russia at the first partition of Poland; and in 1796, was joined to the government of Vitebsk, under the name of *White Russia*; but since 1802, it has formed a separate government.

**MOHILEV**, or Mogilev, the capital of the government of the same name in European Russia, and one of the finest towns of Russia, is situated in the centre of the government, on the right bank of the Dnieper, 100 miles south-west of Smolensk. It is the seat of a Greek archbishop, and of the Roman Catholic primate of Russia and Poland, besides being the favorite residence of many of the Russian nobility. It possesses a fine Greek cathedral, built in 1780, 20 Greek, one Lutheran, and four Roman Catholic churches, several synagogues, and a variety of religious, educational, and charitable institutions. Its streets are wide, straight, and well paved, and there is a fine promenade bordered with trees, whence a beautiful view of the valley of the Dnieper is obtained. Pop. (1867) 83,922, of whom one-third are Jews. There is a large export trade to the chief ports of the Baltic and Black Seas.

**MOHILEV**, or Mogilow, a district town on the south-west frontier of the government of Podolia, European Russia, is situated on the left bank of the Dniester, 80 miles east-by-south from Kamlnetz. Pop. (1867) 9756. It carries on an active trade with the adjacent Russian provinces, and with the Turkish principalities of Moldavia and Wallachia. The climate is so mild, that silk and other products of warm climates are extensively produced.

**MÖHLER**, Johann Adams, one of the most distinguished modern polemical divines of the Roman Catholic Church, was born of humble parentage, at Igersheim, in Würtemberg, May 6, 1796. He received his early education at the gymnasium of Mergentheim, whence, in his 17th year, he was transferred, for the higher studies, to the Lyceum of Ellwangen; and soon afterwards entered upon the theological course in the university of Tübingen. He received priests' orders in 1819; and for

Moldova  
Moldavia

166

a short time was employed in missionary duty; but in 1820, he returned to college-life, for two years was engaged as classical tutor; but, in 1822, the offer of a theological appointment in the university of Tübingen, finally decided his choice to the study of divinity. He was permitted, before entering on his studies, to spend some time in making himself acquainted with the routine of the theological courses of other universities—as Göttingen, Berlin, Prague, Vienna, and Landshut; and in 1823, he entered upon his new position. In 1828, in which year he was also admitted to the degree of Doctor of Divinity, he was appointed ordinary professor of theology. His earliest publication was a treatise “On the Unity of the Church” (1826), which was followed, in 1827, by a historico-theological essay on “Athanasius and the Church of his Time, in Conflict with Arianism.” But his reputation, both posthumous and among his own contemporaries, rests mainly on his well-known “Symbolism;” or, the Doctrinal Differences between Catholics and Protestants, as represented by their Public Confessions of Faith” (1832). This remarkable book at once fixed the attention of the theological world. It passed through five large editions in six years. It was translated into all the leading languages of Europe, and drew forth numerous criticisms and rejoinders, the most considerable of which is that of Dr F. C. Baur (q. v.), 1833. To this M. replied in 1834, by a work entitled, “Further Researches into the Doctrinal Differences of Catholics and Protestants.” The polemical bitterness evoked by these controversies made it desirable that M. should leave the university of Tübingen. He was invited to Breslau, and also to Bonn, but ultimately selected (1835) the university of Munich, then in the first flush of its efficiency, under King Louis. His first appointment was nominally the chair of Biblical Exegesis, but he really devoted himself to the department of Church History, in which his opening course was eminently successful; but, unhappily, a naturally delicate constitution began to give way under the constant fatigues of a student's life; and although he continued, under all these disadvantages, to maintain and to add to his reputation, and although, in 1837, the invitation to the Bonn professorship was renewed in still more flattering terms, he gradually sunk under consumption, and died April 12, 1839. His miscellaneous works were collected and published posthumously, in 2 vols. 8vo (1839—1840), by his friend, the now celebrated Dr Döllinger. M. may be regarded as at once the most acute and the most philosophical of the modern controversialists of his church. He deals more, however, with the exposition of the points and the grounds of the doctrinal differences of modern sects, than with the discussion of the scriptural or traditional evidences of the peculiar doctrines of any among them.

MOÏDORE, a former gold coin of Portugal, of the value of 4800 reis, or nearly 27s. sterling. It was also called *Lisbonine*.

MOÏRE, the French name (formerly *mohère*, and supposed to be taken from the Eng. *mohair*, which is itself probably of Eastern origin) applied to silks figured by the peculiar process called waterling. The silks for this purpose must be broad and of a good substantial make; thin and narrow pieces will not do; they are wetted, and then folded with particular care, to insure the threads of the fabric lying all in the same direction, and not crossing each other, except as in the usual way of the web and the warp. The folded pieces of silk are then submitted to an enormous pressure, generally in a hydraulic machine. By this pressure, the air is slowly expelled, and in escaping, draws the moisture into curious waved lines, which leave the permanent marking called waterling. The finest kinds of watered silks are known as *Moirés antiques*.—The same process has been applied to woollen fabrics called *Moreen*, which is only an alteration of the word *moire*.

MOÏRÉE MÉTALLIQUE, a French term applied to tin-plate upon which a peculiar figuring like that caused by frost on windows is produced by dipping plates, in a heated state, into nitro-muriatic acid, and then washing with water, to remove the acid. When dry, the plates are varnished or lacquered, and have a pretty effect. The cheapness and ease of the process have made it very common for inferior articles in tin.

MOISSAC, a town of France, in the department of Tarn-et-Garonne, on the river Tarn, 15 miles north-west of Montauban. The church of St Pierre dates from the year 1100, and contains some excellent carvings and curious fantastic sculptures. M. is the centre of an important trade in grain. Pop. (1872) 4837.

**MOLA**, a city and seaport of the Italian province of Bari, delightfully situated among gardens and olive groves, on the Adriatic, 13 miles from Bari. It contains fine churches and other edifices, and excellent streets. From all accounts, it seems to have exceedingly little trade of any kind. Pop. 12,181.

**MOLA'SSES**. See **SUGAR**.

**MOLD** (anciently *Monte Alto*; Welsh, *Wyddgrug*), a parliamentary borough in the county of Flint, situated on the Alun, 12 miles west-south-west of Chester. Though Flint is the county town, the assizes and quarter-sessions for the county are held here. The town possesses a good market, a fine old church, and several dissenting chapels. It is connected with England by a branch of the Chester and Holyhead Railway. The neighborhood abounds with mineral wealth, coal and lead being the principal produce; it has also numerous interesting relics of antiquity—e. g., so-called Druidic circles, Roman roads and encampments, Saxon earthworks, an eminence called *Dryn Beili* (formerly surmounted by a castle), and a castellated building known as the Tower of Rhelwylt ab Gruffydd, the two latter having been scenes of frequent contentions between the English and Welsh. Many old families have mansions in the neighborhood, whose pleasing variety of scenery renders it attractive. Pop. of parliamentary borough (1871), 4534.

**MOLDAU** (Bohemian, *Vitava*), the chief river of Bohemia, and an important tributary of the Elbe, rises in the Böhmerwald Mountains, on the south-west frontier, at an elevation of 3750 ft. above the level of the sea, and flows s. e. to Hohenfurth, where it bends northward, and pursues that direction to its confluence with the Elbe opposite Melnik, after a course of 276 miles. Its course to the point of confluence is longer than that of the Elbe, and the navigation of that river is greatly facilitated by the body of water which it contributes. It receives on the left, the Wotawa and the Beraun; and on the right, the Luschnitz and the Sazawa. The chief towns on its banks are Krumau, Budweis, and Prague. It becomes navigable from Budweis.

**MOLDAVIA AND WALACHIA**, two states forming the so-called *Danubian Principalities*, which, since 23d December 1861, have been united under one prince and one administration, and officially bear the single name of **ROUMANIA or RUMANIA**. Their political relations have always been so close, that it has been considered best to describe them together. Reliable statistics as to the Dobrudscha (q. v.) granted at the Berlin Congress of 1878 in return for Rumanian Bessarabia (q. v.) ceded to Russia, are not yet forthcoming.

1. **MOLDAVIA** (Ger. *Moldau*, Turk. *Bogdan*) is bounded on the n. and e. by Russia, on the s. by Walachia, and the w. by Hungary. Area, since the cession of Bessarabia, about 15,000 sq. miles. The country forms, geographically, part of the great plain of South Russia, except towards the west, where there are spurs from the Carpathians. It is watered by the Pruth, the Sereth, and the Danube, and is almost everywhere fertile, producing considerable quantities of grain, fruit, and wine. But the riches of the country consist mainly in its cattle and horses, of which immense numbers are reared on its splendid and far-stretching pastures; swine and sheep are also numerous; and the rearing of bees, owing to the multitude of lime-trees, is extensively carried on. The great plagues of the land are locusts and earthquakes. Minerals and precious metals are said to be abundant, but they have not as yet been worked. There are only a few salt-pits near Okna, in the Carpathian Mountains. Trade is almost exclusively in the hands of the numerous Jews, Germans, Greeks, and Russians who have settled in the country. The capital of M. is Jassy (q. v.), but the great centre of trade is Galacz (q. v.), where, of late, several British merchants have established houses. The principal exports are grain, wool, lambs' skins, hides, feathers, maize, tar, tallow, honey, leeches, cattle, and salt (in blocks); the imports are chiefly the manufactured products of Western Europe. M. is divided into 13 districts, each of which has a prefect or governor, a receiver-general of taxes, and a civil tribunal, consisting of a president and two other judges.

2. **WALACHIA**, the larger of the United Danubian Principalities, is bounded on the n. by the Austrian empire and Moldavia, on the e. and s. by the Danube, and on the w. by the Austrian empire and the Danube. Length from the western frontier to Cape Kilia on the Black Sea, 805 miles; greatest breadth, 130 miles; area, 27,800 square miles. The greater part of W. is quite flat; but in the north, where it

borders on Hungary and Transylvania, it gradually rises up into a great mountain-wall, impassable save in five places. It is destitute of wood throughout almost its whole extent; and especially along the banks of the Danube, is covered with marshy swamps, miles upon miles in breadth. The principal river flowing *through* the country is the Aluta, which joins the Danube at Nikopol. The climate is extreme; the summer heats are intense; while in winter, the land lies under deep snow for four months. The principal products are corn, maize, millet, wine, flax, tobacco, and olive-oil. The vast treeless heaths afford sustenance to great herds of cattle, sheep, and horses. As in Moldavia, agriculture is an important branch of industry; and the swampy districts of the south are haunted by immense numbers of wild water-fowl. In minerals—especially gold, silver, copper, and rock-salt—the soil is rich, but only the last of these is extensively worked. Bucharest is the capital of Walachia and of Rumania. The pop. of Rumania, though the loss of Bessarabia was not balanced by the gain of the Dobrudscha, was still estimated in 1878 at near 5 millions.

*Administration.*—The ruler of the Principalities—styled by the Romans *Domnus* or *Domnitor*; officially called by the Sublime Porte, *Voivod* (Prince); by the Turks generally, *Hauer-Effendi* (Lord of the Unbelievers); and by the Russians, *Hospodar* or *Gosvodarj* (Prince)—receives his investiture from the sultan, but is otherwise independent. By the treaty of Paris (1856) and the Convention (1868), M. and W. were politically united under one prince, with a special ministry for each country, two elective assemblies, and a central commission, which had its seat at Fokshani. But in Nov. 1861, the sultan sanctioned the administrative union of the two states; and in the following month, it was publicly proclaimed at Bucharest and Jassy. The first ruler of Rumania, Prince Alexander John Couza, was forced to abdicate in 1866, when Karl I., son of the prince of Hohenzollern-Sigmaringen, was chosen his successor. At the same time, a new and more popular constitution was adopted by a constituent assembly elected by universal suffrage. The legislative power is vested in two houses, a senate and a chamber of deputies. The former consists of 76, and the latter of 157 members, of whom 82 are for W. and 75 for Moldavia. The members of both houses are chosen by indirect election—i. e., the first voters nominate electors, who chose the members. All citizens who have reached their 25th year, and who can read and write, are voters in the first instance, and every Ruman who possesses a small yearly income is eligible for a seat in parliament. The prince has a suspensive veto over all laws passed by both chambers. He is also chief of the executive, which is composed of a council of seven ministers, heads of the departments of the Interior, of Foreign Affairs, of War, of Finance, of Justice, of Commerce and Agriculture, and of Religion and Public Instruction. Judges are removable at the pleasure of the superior authorities. The legal codes are founded upon the civil law and the customs of the Principalities; but though the system of jurisprudence has been much amended, many reforms remain to be effected, especially in the administration of the laws, which is said to be most corrupt.

*Religion.*—The established religion of Rumania is that of the Greek Church, to which nearly the whole population belong; but all forms of Christianity are tolerated, and their professors enjoy equal political rights. At the head of the Greek clergy stand the metropolitan archbishops of M. and W., the latter of whom is primate of Rumania. Every bishop is assisted by a council of clergy, and has a seminary for priests; the superintendent of the preaching clergy is the *Proto-papa* of the diocese. The ecclesiastical wealth of the country was formerly very great, but the increased expenditure that followed the union of the two states rendered a scheme of spoliation the only means left to the government to extricate itself from its difficulties—in a word, the convent-properties were wrested from the hands of the Greek monks, and placed under the administration of the state. It had been the fashion to establish such convents in Turkey as supports to the orthodox faith, and the institutions in the Principality itself were richly endowed in land and other ways: it was resolved to apply the revenues to the relief of national needs, such as schools, hospitals, the support of the poor, &c., and to give only the overplus to the clergy. This has considerably increased the revenue of the state. The administration, however, is now put upon a better footing.

*Education.*—There are upwards of 2000 elementary schools, besides normal schools, gymnasia, private schools, &c., in all about 2500 schools. There are two universi-

tica. Education is gratuitous and compulsory. There are numerous French boarding-schools, and French is now the language of the educated circles, especially ladies (as Greek used to be), but the state language and the proper national tongue is the Rumanian.

**Army.**—The military force of Rumania is organised on the plan of the Russian army, and the staff officers are principally Russian. The militia is formed by the peasantry in the proportion of two men for every 100 families; but along the banks of the Danube, all the inhabitants capable of bearing arms are organised into a military force. By the law of 1872, all natives of Rumania from twenty to forty are liable to military service in the standing army, four years active and four in the reserve. The militia is composed of all who have been in the standing army at any age between twenty and thirty-six. In 1877 the entire Rumanian military force numbered 144,608 men, but of these only 42,449 belonged to the regular or "permanent" army.

**Commerce.**—The total value of the imports of Rumania in 1874 amounted to 92,000,000 lei (= a franc), or about £3,700,000; and of the exports, 158,000,000 lei, or about £6,320,000. The principal article of export is grain, especially wheat and maize. Rumanian industry has largely profited by the construction in recent years of several lines of railway. In 1869, the first line, 42 English miles in length, was opened from Bucharest to Giurgevo on the Danube, and in subsequent years a network of railways was completed, connecting the capital with Western Europe through the towns of Pivesti, Buzeo, Braila, Tekutch, Roman, and Suceava, and from thence to Lemberg, in Austria. In 1875 there were also 2360 miles of telegraph in the Principalities. The estimated revenue in 1876 was £3,915,000; the expenditure, £4,050,000; the public debt was in 1877 above £24,000,000.

**Race, Language, and Literature.**—The great majority of the inhabitants are known in Western Europe as Walachs, but they call themselves *Români*. The Walachs, however, are not confined to the Principalities, but inhabit also the southern part of Bukovina, the greater part of Transylvania, Eastern Hungary, a part of the Banat, Bessarabia, some districts in Podolia and Kherson, and portions of Eastern Serbia. They are also found in Macedonia, Albania, and Thessaly. They are a mixed race, produced by the amalgamation of the Emperor Trajan's Roman colonists with the original Dacian population, and subsequently modified by Grecian, Gothic, Slavic, and Turkish elements. This mixture is seen in their language, three-fourths of the words of which are Latin (the Dacian has disappeared), while the remaining fourth is made up of words from the other four languages. Walachian literature is rich in popular songs; since the 16th c., many works in prose and verse have been printed, and of late years, two political journals in the Walachian tongue have been established, one at Bucharest, and another at Jassy. A "Grammatica Daco-Romana" was published by Johann. Alexi (Vienna, 1826); and a "Historia Linguae Daco-Romanæ" by Laurianus (Vienna, 1849). A large Latin-Romanic-Hungarian Dictionary was carefully executed by the bishop of Fogarasz, Joh. Bob (3 vols. Kienzenburg, 1839).

**Social condition.**—Very recent statistics on this point are not attainable. In M., there are rather less, in W., considerably more than 8000 bojars, besides whom there is an extensive inferior nobility. In W., every twenty-eighth man is a nobleman; every one hundred and thirty-third, a merchant; and in the capital, every twentieth is a merchant. The free peasants, or yeomen, called *Rezeachs*, are not numerous—in all W., there are under 5000. Gipsy communities are an important element in the population; upwards of 150,000 of this mysterious race are, or were serfs belonging to the rich bojars and the monasteries. In 1844, about 80,000 were emancipated, and settled in colonies in different parts of the land: they call themselves *Românitchel* or *Români*. The common people are on the whole good-humored, frugal, sober, and cleanly; murder and larceny are almost unknown. Their dwellings, however, are, as may be supposed, of the most wretched description; composed chiefly of interlaced willow-witches, covered with mud, cane, and straw.

**History.**—In ancient times, M. and W. formed an important part of Dacia (q. v.), and the two countries have in general experienced the same vicissitudes. At the period of the migration of nations, and in the following centuries, they were the scene of the struggles between the Gothic, Hunnic, Bulgarian, and Slavic races—the Avari, Chazars, Petschenegi, Uzi, and Magyars, who alternately ruled or were

expelled from the country. These peoples all left some traces (more or less) of themselves among the Romanised Dacian inhabitants, and thus helped to form that composite people, the modern Walachs, who, in the 11th c., were converted to the Christianity of the Eastern or Greek Church. Their incursions, however, frightfully devastated the country. In the 11th c., the Kumans, a Turkish race, established in M. a kingdom of their own. Two centuries later, the great storm of Mongols broke over the land. It now fell into the hands of the Nogai Tartars, who left it utterly wasted, so that only in the forests and mountains was any trace left of the native Walachian population. In the latter half of the 13th c., a petty Walach chief of Transylvania, Radu Negru of Fogarasch, entered W., took possession of a portion of the country, divided it among his bojars (noble followers), founded a senate of 12 members, and an elective monarchy; and gradually conquered the whole of Walachia. Rather less than a century later (1354), a similar attempt, also successful, was made by a Walach chief of the Hungarian Marmarosch, of the name of Bogdan, to re-people Moldavia. In the beginning of the 16th c., both Principalities placed themselves under the protection of the Porte, and gradually the bojars lost the right of electing their own ruler, whose office was bought in Constantinople. After 1711, the Turks governed the countries by Fanariot princes (see FANARIOTS), who in reality only farmed the revenues, enriched themselves, and impoverished the land. In 1802, the Russians wrested from Turkey the right of surveillance over the Principalities. A great number of the nobles—through family marriages with the Fanariots—were now of Greek descent, the court-tongue was Greek, and the religious and political sympathies of the country were the same. Hence the effort of the Principalities in 1821 to emancipate themselves from Turkish authority, which was only the prelude to the greater and more successful struggle in Greece itself. In 1822, Russia forced Turkey to choose the princes or hospodars of W. and M. from natives, and not from the corrupt Greeks of Constantinople; and after 1829, to allow them to hold their dignity for life. The Principalities, united under one ruler in 1858, were brought under one administration in 1861. For subsequent history, see RUMANIA.

MOLÉ, Louis Matthien, Comte, a French statesman, and a descendant of the famous French statesman and magistrate, Matthien Molé (b. 1584; d. 1653), was born at Paris, 24th January 1781. His father, President of the Parliament of Paris, died by the guillotine in 1794. His mother was a daughter of Malesherbes. M. was for the most part his own preceptor, and displayed a wonderfully precocious love of hard work and independent reflection. In 1805, he published "*Essais de Morale et de Politique*," in which he vindicated the government of Napoleon on the ground of necessity. The attention of the emperor was drawn to him; he was appointed to various offices in succession, and raised to the dignity of a count, and to a place in the cabinet. After Napoleon's return from Elba, he refused to subscribe the declaration of the Council of State banishing the Bourbons for ever from France, and declined to take his seat in the Chamber of Peers. In 1815, Louis XVIII. made him a peer, and he voted for the death of Ney. In 1817, he was for a short time Minister of Marine, but afterwards acted independently of party, and was one of the principal orators in the Chamber of Peers. In 1830, he became Minister of Foreign Affairs in Louis Philippe's first cabinet, but only for a short time. In 1836, he succeeded Thiers as prime minister; but in the eyes of the liberal party, he displayed too entire a devotedness to the wishes of the king, and thus rendered his ministry very unpopular, so that in 1839 he felt it necessary to resign. In 1840, he was chosen a member of the *Académie Française*. From that time he took little part in political affairs, but after the revolution of 1848 exerted himself, but in vain, to rally and unite the party of order in the assembly to which he had been elected. He died at Champêtreux, 23d November, 1855. M. was fiercely attacked and abused in the latter part of his political career, but it is not now believed that he was servile towards the court. He detested anarchy, and believed in the necessity of a strong government; but he loved genuine liberty, and always placed the constitution above the king. When Louis Napoleon's *coup d'état* extinguished the republic, M. proudly said, that henceforth he could have nothing to do with politics.

MOLE (*Talpa*), a genus of quadrupeds of the order *Insectivora*, and family *Talpidae*. All the *Talpidae* live chiefly underground, and their structure is adapted to

their mode of life. In their general form, the character of their fur, the shortness of their limbs, the great muscular strength of the fore-parts, and great breadth of the fore-paws, the elongated head, the elongated and flexible snout, the smallness of the eyes, and the complete concealment of the ears, they all resemble the COMMON *M. (T. Europæa)*, with which also they pretty nearly agree in the nature of their food, their mode of seeking it, their dentition, and the shortness of their alimentary canal.—The Common *M.* is abundant in most parts of Europe, except the utmost north and utmost south. In Britain, it is very plentiful, except in the north of Scotland; but is not found in Ireland nor in some of the Scottish islands. Instead of its ordinary uniform black color, it is occasionally found yellowish white, or gray, and even orange. Its silky or velvety fur lies smoothly in every direction, the short hairs growing perpendicularly from the skin; a peculiarity which preserves it clean as the animal moves either backwards or forwards in its subterranean galleries. The fore-paws are not only very broad, but are turned outwards, for the better throwing back of the earth in burrowing. They are terminated by five long and strong claws. The phalangeal bones are remarkable for breadth, and an elongated bone of the carpus gives additional strength to the lower edge of the paw. The two bones of the fore-arm are fastened together. The shoulder-blades and the clavicles are very large; and the sternum has an elevated ridge as in birds and bats, for the attachment of powerful muscles. The muscles which move the head are also very powerful, and the cervical ligament is even strengthened by a peculiar bone; the *M.* making much use of its flexible snout in burrowing. The hinder limbs are comparatively feeble, and the feet small, with five toes. The eyes are black and very small, capable of being partially retracted and exerted. The senses of hearing, taste, and smell are very strongly developed in the mole. The cutting-teeth are very small and sharp; the canines long and sharp; the true molars broad, with many sharp conical elevations. This dentition adapts the animal for feeding not only on worms and grubs, but also on frogs, birds, and small quadrupeds, which accordingly are its occasional prey, although earthworms are its chief food. The *M.* is an excessively voracious animal; digestion is rapid, and so long an interval can be endured between meals, hunger soon ending in death. When pressed by hunger it will attack and devour even one of its own kind; and its practice is immediately to tear open the belly of any bird or quadruped which it has killed, and, inserting its head, to satiate itself with the blood. In eating earthworms, it skins them with remarkable dexterity. In quest of them, it works its way underground, throwing up the earth in mole-hills; more rarely in the fine nights of summer it seeks for them on the surface of the ground, when it is itself apt to be picked up by an owl equally in want of food. The habitation of the *M.* is of very remarkable construction: a hillock of earth larger than an ordinary mole-hill, and containing two circular galleries, one above the other, with five connecting passages, and a central chamber which has access to the upper gallery by three passages; whilst about nine passages lead away from the lower gallery in different directions. The end of a passage entering a gallery on one side is never opposite to the end of a passage entering on the other. To afford all facility of escape in case of any alarm, a passage leads at first downwards from the central chamber, and then upwards again till it joins one of the high roads which the *M.* keeps always open, which are formed by pressing the earth till it becomes smooth and compact, and are not marked by any mole-hills thrown up, and which not only serve for escape when necessary, but lead to those parts of the creature's appropriated domain where the ordinary mining for worms is to be prosecuted. The nest in which the female *M.* produces her young is not this habitation, but is formed generally under a mole-hill rather larger than usual, where two or three runs meet, and is lined with leaves and other warm materials. The *M.* breeds both in spring and autumn, and generally produces four or five young at a birth. The attachment of the parent moles seems to be strong, but transitory.

It has been sometimes alleged that moles eat vegetable as well as animal food, and that they are injurious to farmers, by devouring carrots and other roots; but it appears rather that they only gnaw roots when in the way of their mining operations, or perhaps, also, in quest of grubs which they contain. Moles are generally regarded as a pest by farmers and gardeners, owing to the injury which mole-hills do to lawns and pastures, the burying up of young plants, and the disturbance of their roots. But they are certainly of use in the economy of nature in preventing the

Mole  
Molesworth

172

excessive increase of some other creatures; and probably also contribute to the fertility of some pastures, by the continual tillage which they carry on. Mole-traps of various kinds are in use, which are planted, if the mole-catcher is skilful, in the often-traversed roads of the animals. Mole-catching has long been a distinct trade in Britain.

The name M. is abbreviated from the old English name *Mouldwarp*, or *Mouldiwarp*, still provincially used, and which is derived from the Anglo-Saxon *molda*, mould, and *weorpan*, to throw up.

Another species of M. (*T. cæca*) is found in the most southern parts of Europe; very similar to the Common M., but rather smaller, and having the eye always covered by the eyelid, so as to justify Aristotle's statement, that the M. is blind.—A species, also very similar to the Common M., is found in North America.

Among the other *Talpidae* are the CHANGEABLE M., or CAPE M. (*Chrysochloris Capensis*) of South Africa, which is remarkable as the only one of the mammalia that exhibits the splendid metallic reflections so frequently seen in some other classes of animals; the SKEW M. (q. v.) and the STAR-NOSE (q. v.) of North America.

MOLE. See NAEVUS.

**MOLE-CRICKET** (*Gryllotalpa*), a genus of insects of the Cricket (q. v.) family (*Achetidae* or *Gryllidae*), remarkable for burrowing habits, and for the great strength and breadth of the fore-legs. The other legs are also large and strong, but of the form usual in the family.—The best known species (*G. vulgaris*)—common in many parts of Europe, and pretty abundant in some places in England, but very local—is almost two inches long; of a velvety brown color; the wings, when folded, do not cover much more than one-half of the abdomen, although large when expanded. It uses its fore-legs not only for digging burrows in earth, but for cutting through or tearing off the roots of plants which come in its way. The M. feeds both on animal and vegetable substances, and often does no small injury to crops. The chirping, and somewhat musical call of the M., produced in the same way as that of the common cricket, is heard chiefly in the end of spring and beginning of summer, and only in the evening or at night. In some parts of England, this sound has gained the name of *Chur-worm*. Another local English name is *Croaker*.—The female M. prepares a curious nest, a rounded subterranean cell, about as large as a hen's egg, having a complicated system of winding passages around it, and communicating with it. In this cell, she deposits from 100 to 400 eggs. The young live for some time in society. They run actively, both in the larva and pupa states. The M. is very combative, and the victor generally eats the vanquished.—A species of M. (*G. didactyla*) does great injury to the plantations of sugar-canes in the West Indies.—A curious Indian insect, of a closely allied genus (*Schizodactylus monstrosus*), has prodigiously long wings, which, as well as the wing-covers, are rolled into spiral coils at the tips.

**MOLE-RAT** (*Spalax* or *Aepalax*), a genus of rodent quadrupeds of the family *Muridae*, having teeth almost like those of rats, but in many respects resembling moles, as in general form, shortness of limbs, concealment of ears, smallness or even rudimentary condition of eyes, and burrowing habits—although their food is altogether different, consisting wholly of vegetable substances, and chiefly of roots. One species (*S. typhlus*) inhabits the south of Russia and some parts of Asia. It is also known as the *Podolian Marmot*, *Blind Rat*, *Slepez*, *Zemni*, &c. The M. makes tunnels and throws up hillocks like the mole, but its hillocks are much larger.—Another species, found in the Malayan Archipelago, is as large as a rabbit.—Nearly allied is the COAST RAT or SAND MOLE of S. Africa (*Bathyergus maritimus*), also as large as a rabbit, with other species of the same genus, also natives of S. Africa, which drive tunnels through the sandy soil, and throw up large hillocks.

**MO'LESKIN** and **CO'RDUROY** are varieties of FUSTIAN (q. v.), a term which is used in a generic sense to include also velveteen, velveret, thick-set, thick-set cord, beaverteen, and other stout cotton cloths for men's apparel—a class of goods largely manufactured in Lancashire. The general structure of these fabrics is described under FUSTIAN and VELVET. They are, in point of fact, all of the nature of velvet, with a nap or pile on the surface, and most of them are twilled.

When cloth of this kind leaves the loom, its surface is covered with loops like

Brussels carpet, and these are then cut open with a ripping-knife of a peculiar shape, which the operatives learn to use with greasy dexterity. The hairy and uneven appearance which the cloth acquires in this operation is subsequently improved by the shearing process. The cloth is next steeped in hot water, to get rid of the paste used in dressing the yarn, and is then ready to be passed through the brushing or teasing machine, which consists of blocks of wood with concave surfaces covered with card-brushes, working backwards and forwards in a lateral direction against wooden rollers, encased in tin-plate, over which the cloth passes. The tin-plate is made rough with the burs of punched holes. In the next operation, the fustian is singed by passing the nap side quickly over a red-hot metal cylinder. The brushing and singeing are repeated three and occasionally four times to give the cloth a smooth appearance. It is then washed, bleached with chloride of lime, and dyed—usually of some shade of olive, slate, or other quiet color.

The different names given to fustian cloths depend upon their degree of fineness, and the manner in which they are woven and finished. Thus, smooth kinds, of a strong twilled texture, are called *moleskins* when shorn before dyeing, and *beavertons* when cropped after dyeing. Corduroy, or king's cord, is produced by a peculiar disposition of the pile-threads. In all fustians, there is a warp and weft-thread, independent of the additional weft-thread forming the pile; but in corduroys, the pile-thread is only "thrown in" where the corded portions are, and is absent in the narrow spaces between them.

Until a comparatively recent period, the quantity of fustian cloths annually consumed in the British Islands must have been very large, but the increased price of cotton, and the introduction of cheap woollen fabrics, have now very much curtailed the use of them. They are still, however, largely worn by certain classes of mechanics and laborers.

**MOLESTATION**, in Scotch Law, means disturbing the possession of heritage, and an action of molestation is a remedy for the trespass.

**MOLESWORTH**, Sir William, Right Honorable (eighth baronet), English statesman, was born in 1810. Lineally descended from an old Cornish family of large possessions (the first baronet was president of the Council in Jamaica in the time of Charles II., and subsequently governor of that island), he early shewed promise of distinction. His university career at Cambridge was, however, cut short by his sending (under circumstances of great provocation) a challenge to his tutor to fight a duel. He continued his education at the university of Edinburgh, and subsequently at a German university. After making the usual tour of Europe, he returned home, and threw himself, in 1831, into the movement for parliamentary reform. Next year, although only just of age, he was elected member of parliament for Cornwall (East). He sat for Leeds from 1837 to 1841, and then remained out of parliament four years, during which interval he used to say he gave himself a second and sounder political education. He was the intimate friend of Bentham and James Mill, and was regarded as the parliamentary representative of the "philosophical Radicals." Having been a great admirer of Hobbes, he accumulated materials for a life of the "Philosopher of Malmesbury," which remains in MS. uncompleted. In 1839, he commenced and carried to completion, at a cost of many thousand pounds, a reprint of the entire miscellaneous and voluminous writings of that eminent author. The publication was a valuable contribution to the republic of letters, and the works of Hobbes were placed by M.'s munificence in most of our university and provincial public libraries. The publication, however, did him great disservice in public life, his opponents endeavoring to identify him with the freethinking opinions of Hobbes in religion, as well as with the great philosopher's conclusions in favor of despotic government. In 1846, he was elected for Southwark (which he continued to represent until his death), and entered upon a parliamentary career of the greatest energy and usefulness. He was the first to call attention to the abuses connected with the transportation of criminals, and as chairman of a parliamentary committee brought to light all the horrors of the convict system. He pointed out the maladministration of the colonial office, explained the true principles of colonial self-government, prepared draught constitutions for remote dependencies, and investigated the true and natural relations between the imperial government and its colonial empire. M.'s views, although at first unpalatable to the legislature, have been adopted by successive administrations, and are now part

Molletta  
Mo.ina

174

and parcel of the colonial policy of Great Britain. In January 1853, he accepted the office of First Commissioner of Public Works, in the administration of the Earl of Aberdeen; and in 1855, the post of Secretary of State for the Colonies, in that of Viscount Palmerston. This appointment gave great satisfaction to our dependencies; but before he could give proof of his administrative capacity, he was (October 22, 1856) struck by the hand of death, while yet in the full vigor of life and intellect. He established the "London Review," a new quarterly, in 1835; and afterwards purchased the "Westminster Review," the organ of the "philosophical Radicals." The two quarterlies being then merged into one, under the title of the "London and Westminster," M. contributed to it many able articles on politics and political economy.

**MOLFE'TTA**, a city of Southern Italy, in the province of Bari, situated on the Adriatic, 18 miles n. w. of Bari; pop. (1872) 26,829. The neighborhood yields excellent fruits, especially almonds and oranges, and has extensive olive plantations. Fish abound along the coast. The city contains a magnificent cathedral, and is partly enclosed by walls; it is conjectured that it occupies the site of some early forgotten town, from the numerous vases, urns, and other relics of antiquity found in its vicinity.

**MOLIERE**, Jean Baptiste (properly, *Jean Baptiste Poquelin*—the name of Molière not having been assumed till he had commenced authorship), was born at Paris, 15th January 1622. His father, Jean Poquelin, was then an upholsterer, but subsequently became a valet-de-chambre to the king. Regarding the boyhood of M., almost nothing is known, but his credulous biographers have put together whatever traditionary gossip they could find floating on the breath of society. Voltaire, while recording these *contes populaires*, as he calls them, pronounces them *très-faux*. All that we really are certain of is, that in his 14th year he was sent to the Jesuit *Collège de Clermont* in Paris, where he had for a fellow-student Prince Armand de Conti, and that, on leaving the Collège, he attended for some time the lectures of Gassendi. He was charmed, we are told, by the freedom of thought permitted in speculative science, and, in particular, conceived a great admiration for Lucretius, the Roman poet-philosopher, whom he undertook to translate. Of this translation, only a single passage remains, intercalated in the "Misanthrope" (act II. scene 4.). About 1641, he commenced the study of law, and appears to have even passed as an advocate; but the statement of Tallement des Réaux that he actually ventured into the precincts of theology, is generally rejected. M. detested priests. So gay, humorous, and sharp-eyed a humanitarian would have felt quite miserable under the restraints of a monkish life. In 1645, he suddenly appeared upon the stage as a member of a company of strolling players, which took the name of the *Illustre Théâtre*, and performed at first in the faubourgs of Paris, and afterwards in the provinces. For the next 19 years we can only catch an occasional glimpse of him. He was playing at Nantes and Bordeaux in 1643, at Narbonne and Toulouse in 1649, at Lyon in 1653 (where his first piece, "L'Etonnadi," a comedy of intrigue, was brought out), at Lyon and Narbonne again in 1655, at Grenoble during the carnival, and also at Rouen in 1658. During these now obscure peregrinations, he seems, although an industrious actor, to have been also a diligent student. He read Plautus, Terence, Rabelais, and the Italian and Spanish comedies, besides—which, indeed, all the rest would have been of little avail—making a constant use of as quick eyes as ever glittered in a Frenchman's head. At Paris, by the powerful recommendation of his old schoolfellow, the Prince de Conti, M.'s company got permission to act before the king, who was so highly pleased, that he allowed them to establish themselves in the city under the title of the *Troupe de Monsieur*. In 1659, M. brought out "Les Précieuses Ridicules," the fine satire of which—lapsing at times, however, into caricature—was instantly perceived and relished. "Courage, Molière!" cried an old man on its first representation; "voilà la véritable comédie." The old man was a prophet. Veritable comedy dated in France from that night. Ménage, the critic, is reported to have said to Chaplain the poet, as they were going out of the theatre: "Henceforth (as St Remi said to Clovis), we must burn what we have worshipped, and worship what we have burned." In 1660 appeared "Sganarelle, ou le Cocu Imaginaire;" and in 1661, "L'Ecole des Maris"—

partly founded on the "Adelphi" of Terence, in which M. completely passes out of the region of farce into that of pure comic satire—and "Les Fâcheux." In the following year, M. married Armande-Grétiude Béjart, either the sister or daughter (for it is still undetermined) of Madeleine Béjart, an actress of his troupe, with whom he had formerly lived in what the French politely call "intimate relations." That, however, there is the slightest ground for supposing that the great comedian incestuously married his own daughter, nobody now believes, though the revolting calumny was freely circulated even in M.'s lifetime. His literary activity continued as brisk as before. Among several pieces belonging to this year, the most celebrated is "L'Ecole des Femmes," which excited, not without reason, the most violent indignation among the clergy and the devout, for there was an excessive indecency in the expression, and the author indulged in a caricature of religious mysteries that could not but be offensive. M. defended himself with incredible audacity in his "Impromptu de Versailles." "Le Tartufe," written in 1664, was prohibited from being brought upon the stage; but M. was invited by his literary friends, Boileau and others, to read it in a semi-public manner, which he did with the greatest approbation. In 1665, Louis XIV. bestowed a pension of 7000 livres on M.'s company, which now called itself the *Troupe du Roi*. Next year appeared "Le Misanthrope," the most artistic of all his comedies; shortly after followed by "Le Médecin Malgré Lui." When "Tartufe" was at last brought upon the stage in 1669, it obtained a superb success. The truth, the variety, the contrast of the characters, the exquisite art shewn in the management of the incidents, the abundance of the sentiments, and the wonderful alternations of feeling—laughter, anger, indignation, tenderness, make this, in the opinion of most critics, M.'s master-piece. To the same year belongs "L'Avare." In 1670 appeared "Le Bourgeois Gentilhomme," a very pleasant satire on a very prevalent vice among wealthy tradesmen—viz., the vulgar ambition to pass for fine gentlemen. Then came "Les Fourberies de Scapin" (1671), followed by "Les Femmes Savantes" (1672), full of admirable passages; and "Le Malade Imaginaire" (1673), the most popular, if not the best of all M.'s comedies. While acting in this piece, he was seized with severe pains, which, however, he managed to conceal from the audience; but on being carried home, hæmorrhage ensued, and he expired at ten o'clock at night (17th February 1673). As M. had died in a state of excommunication, and without having having received the last aids of religion—which, however, he had implored—the Archbishop of Paris refused to let him be buried in consecrated ground; but the king interfered—a compromise was effected, and he was privately interred in the cemetery of St Joseph, being followed to the tomb by a hundred of his friends with lighted torches. In 1792, his remains were transferred to the Museum of French Monuments, from which they were removed to Père Lachaise in 1817. M. ranks as the greatest French comic dramatist—perhaps the greatest of all comic dramatists. Among the best editions of M.'s works are those of Auger (1819—1825), Aimé-Martin (1833-6), Moland (1871), and Despois (1874 *et seq.*). A complete English translation of M.'s works is that by Van Laun, in 6 vols. (Edin. 1875-6). The best biographies are by Taschereau (1825-7), and Bazin (1851). The books devoted to M. and his works would themselves form a large library.

MOLINA, Louis, a celebrated Spanish Jesuit theologian, was born at Cuenca, in New Castile, in the year 1535; and having entered the Jesuit Society in his 18th year, studied at Coimbra, and was appointed Professor of Theology at Evora, where he continued to teach for 20 years. He died at Madrid in 1600, in the 65th year of his age. M.'s celebrity is mainly confined to the theological schools. His principal writings are a commentary on the "Summa" of St Thomas (Cuenca, 2 vols. 1593); a minute and comprehensive treatise "On Justice and Right" (Cuenca, 6 vols. 1593; reprinted at Maluz in 1659); and the celebrated treatise on "The Reconciliation of Grace and Free-will," which was printed at Lisbon in 1588, with an appendix, printed in the following year. Although it is to the last-named work that M.'s celebrity is mainly due, we must be content with a very brief notice of it. The problem which it is meant to resolve is almost as old as the origin of human thought itself, and had already led, in the 4th c., to the well-known PELAGIAN CONTROVERSY (q. v.). In reconciling with the freedom of man's will the predestination of the elect to happiness, and of the reprobate to punishment, M. asserts that the predestination is consequent on God's foreknowledge of the free determination of

man's will, and, therefore, that it in no way affects the freedom of the particular actions, in requital of which man is predestined whether to punishment or to reward. God, in M.'s view, gives to all men sufficient grace whereby to live virtuously, and merit happiness. Certain individuals freely co-operate with this grace; certain others resist it. God foresees both courses, and this foreknowledge is the foundation of one or of the other decree. This exposition was at once assailed in the schools on two grounds—first as a revival of the Pelagian heresy, inasmuch as it appears to place the efficacy of grace in the consent of man's will, and thus to recognise a natural power in man to elicit supernatural acts; second, as setting aside altogether what the Scriptures represent as the special election of the predestined, by making each individual, according as he freely accepts or refuses the grace offered to all in common, the arbiter of his own predestination or reprobation. Hence arose the celebrated dispute between the MOLINISTS and the THOMISTS. It was first brought under the cognizance of the Inquisitor-general of Spain, by whom it was referred to Pope Clement VIII. This pontiff, in 1597, appointed the celebrated congregation, *De Auxiliis*, to consider the entire question; but notwithstanding many lengthened discussions, no decision was arrived at during the lifetime of Clement; and although the congregation was continued under Paul V., the only result was a decree in 1607, permitting both opinions to be taught by their respective advocates, and prohibiting each party from accusing the adversaries of heresy. The dispute, in some of its leading features, was revived in the Jansenist controversy (see JANSEN); but with this striking difference, that whereas the rigorous Jansenists denied the freedom of the will when acted on by efficacious grace, all the disputants in the scholastic controversy—even the Thomists—maintain that, in all circumstances, the will remains free, although they may fail to explain how this freedom is secured under the action of efficacious grace. See AQUINAS.

MOLINISM, the name given to the system of grace and election taught by Louis Molina (q. v.). This system has been commonly taught in the Jesuit schools; but a modification of it was introduced by the celebrated Spanish divine Suarez (q. v.), in order to save the doctrine of *special election*. Suarez held, that although God gives to all grace absolutely sufficient for their salvation, yet he gives to the elect a grace which is not alone in itself sufficient, but which is so tempered to their disposition, their opportunities, and other circumstances, that they infallibly, although yet quite freely, yield to its influence. This modification of Molina's system is called CONGRUISM. Molinism must not be confounded either with Pelagianism or semi-Pelagianism, inasmuch as Molinism distinctly supposes the inability of man to do any supernatural act without GRACE (q. v.).

MOLINOS, Michael de, was born of noble parentage at Patencia, in the kingdom of Aragon, December 21, 1627. He received holy orders and was educated at Pampluna, and afterwards at Coimbra, at which university he obtained his theological degree. After a career of considerable distinction in his native country, M. went to Rome, where he soon acquired a high reputation as a director of conscience, and a master of the spiritual life. His private character was in keeping with this public reputation. He steadily declined all ecclesiastical preferment, and confined himself entirely to his duties in the confessional, and in the direction of souls. An ascetical treatise which he published, under the title of "The Spiritual Guide," added largely to the popularity which he had acquired in his personal relations; but there were not wanting many who, in the specious, but visionary principles of this work, discovered the seeds of a dangerous and seductive error. Among these, the celebrated preacher, F. Segneri, was the first who ventured publicly to call them into question; but his strictures were by the friends of M. ascribed to jealousy of the influence which M. had acquired with the people. By degrees, however, reports unfavorable to the practical results of this teaching, and even to the personal conduct and character of M., or of his followers, began to find circulation; and eventually, in the year 1685, he was cited before the Holy Office, and submitted to close imprisonment and examination. In addition to the opinions contained in his book, a prodigious mass of papers and letters, to the number, it is said, of 20,000, found in his house, were produced against him, and he was himself rigorously examined as to his opinions. The result of the trial was a solemn condemnation of sixty-eight propositions, partly extracted from his "Spiritual Guide," partly, it would appear, drawn from his papers or his personal professions. These doctrines

M. was required publicly to abjure, and he was himself sentenced to close imprisonment, in which he was detained until his death in 1696, when he had entered on his 70th year. The opinions imputed to M. may be described as an exaggeration of the worst and most objectionable principles of QUIETISM (q. v.). According to the propositions which were condemned by the Inquisition, M. pushed to such an extreme the contemplative repose which is the common characteristic of Quietism, as to teach the utter indifference of the soul, in a state of perfect contemplation, to all external things, and its entire independence of the outer world, even of the actions of the very body which it animates; inasmuch that this internal perfection is compatible with the worst external excesses. These consequences are by no means openly avowed in the "Spiritual Guide," but they appear to follow almost necessarily from some of its maxims, and they are said to have been plainly contained in the papers of M., which were produced at his trial, and to have been admitted by himself. After the death of M., no further trace of his teaching appears in Italy, but it was revived in more than one form in France.

MOLLAH, among the Turks, is the title of a superior judge. The Mollahs are divided into two classes: the first of these—four in number, from whom the Mollahs at the court of the Padishah are elected, possesses jurisdiction over the more important pashaliks (Adrianople, Brusa, Damascus, Cairo); and the second, who only hold their office for the space of a lunar month at a time, and the lowest rank of whom is formed by the ualhs, over the inferior provinces, towns, and villages. The Mollah is an expounder of civil and criminal law, and of the religion of the state; he is therefore necessarily both a lawyer and an ecclesiastic. Under him is the Cadi or judge, who administers the law, and superior to him are the Kadhiasker and the Mufti (q. v.). They all are, however, subject to the Sheikh Al Islam or supreme Mufti. In Persia, the office of mollah is similar to what it is in Turkey; but his superior is there the "Sadr," or chief of the Mollahs. In the states of Turkestan, the Mollahs have the whole government in their hands.

MOLLASSE, an extensive Miocene or Middle Tertiary deposit, occupying the central lake-region of Switzerland between the Alps and the Jura. It consists chiefly of a loose sand, but at the foot of the Alps it usually takes the form of a conglomerate called "Nagel-fine," which is said to attain the astonishing thickness of from 6000 to 8000 feet in the Righi, near Lucerne, and in the Speer, near Weesen. The mollasse contains a few shells and some vegetable remains, among which are several palms.

MOLLUSCA, one of the great animal sub-kingdoms, including so wide a range of distinct forms, that it is difficult to frame a definition that shall be applicable to all of them. The lowest forms, termed Polyzoa (q. v.) or Bryozoa, present so strong a resemblance to zoophytes, that until recently they were associated with the latter; whilst, on the other hand, in some of the most highly organised of this sub-kingdom, the Cephalopoda, there is a decided approximation towards the vertebrated series, as is shewn by the presence of a rudimentary cartilaginous skeleton, and by a peculiarity in the development of the embryo. The bilateral symmetry of external form which is almost universal in articulated and vertebrated animals, is here seldom met with; and taking them as a whole, the M. are characterised by the absence rather than by the presence of any definite form. The bodies of these animals are always of a soft consistence—a property to which they owe their name, which was devised for them by Cuvier, before whose time they were included in the *Ferme* of Linnaeus's arrangement. The *shell*, when it exists, is not to be regarded as an exo-skeleton giving attachment to muscles, and regulating the form of the animal, but merely as an appendage designed for the protection of the body from which it derives its shape; indeed, it is only where the body is uncovered by a shell, or where the locomotive organs can be projected beyond it, that any active movement can be effected. The whole fabric is enclosed in a thick, soft, flexible skin, called the *mantle*, and it is on the surface of this envelope that the shell is formed by the development and subsequent calcification of epithelial cells. In many of the M., the shell is composed of a single piece, which is usually a spiral tube, closed at one end, and gradually increasing in size towards the open extremity, from which the animal is able to protrude itself. Shells of this description are called *univalves*. In others, the shell is composed of two pieces or valves, attached to each other at one

point by a hinge, which is furnished with an elastic ligament that serves to open the valves, when it is not opposed by the action of the *adductor* muscles, whose office it is to keep the shell closed. Shells of this kind are termed *bivalves*. These differences in the character of the shell correspond with differences in the conformation of the animals inhabiting them. The bivalve *M.* exhibit no traces of a head, and hence are termed *Acephalous M.*; while the univalves have a distinct head, provided with organs of the special senses, and hence, by way of distinction, some writers have termed them *Cephalophora* (or head-bearing). Many *M.* are altogether unprovided with a shell, or have only a small calcareous plate embedded within the mantle. These are termed *naked mollusca*. It is worthy of notice that the young mollusc, while still in the egg, is almost always furnished with a delicate pellucid shell, even when it is ultimately to be naked, in which case the embryonic shell is cast off soon after the animal makes its escape from the egg. For the mode of formation, &c., of the shell, see *SHELL*.

The movements of many of the *M.* are executed by means of a muscular structure concentrated in some particular part or parts of the mantle, and termed the *foot*. In some (the *Gastropoda*), the foot forms a sort of flattened disc, by the alternate contraction and expansion of different parts of which the animal can slowly crawl forwards; whilst in others (the free-moving bivalves) it is a tongue-like organ, which can be protruded between the valves, and by its sudden extension, after being previously bent upon itself, can enable its possessor (the common cockle, for example) to take considerable leaps. The foot is also the agent by means of which certain species burrow in the sand or mud, and others bore into the solid rock. Many *M.*, however, are firmly attached to a single spot, except during their larval state; and as they do not require a foot, we find it either altogether undeveloped (as in the oyster), or serving to support a glandular organ, from which filaments of silky or horny matter (called the *bysium*) are secreted, which serve to attach the animal (the common mussel, for example) to rocks, stones, &c., beneath the water. Many of the subdivisions of the *M.* present modes of locomotion altogether independent of a foot, as, for example, the *Biphora*, which are described in the article *TUNICATA*; those bivalves which possess a branchial or respiratory chamber, into which water is drawn, and again expelled by muscular action, a recoil being thus produced which serves to drive the animal through the water; the *Pteropoda* (q. v.), which are furnished with a pair of broad flattened fins (which may possibly be regarded as a modified foot) at the sides of the head, by means of which they swim with tolerable rapidity; and the *Cephalopoda*, in which the mouth is surrounded by a number of arms, which serve not only as organs of motion, but for the capture of prey.

The *nervous system* in the *M.* is developed in accordance with two distinct types. In the lowest group of this sub-kingdom (the *Molluscoids*), there is only a single ganglion with afferent and efferent fibres radiating in every direction; while in the higher groups there are several ganglia lying somewhat irregularly in different parts of the body, and communicating by nervous threads with a larger mass placed in the head, or in the neighborhood of the œsophagus. This mass consists of several ganglia, which from their position are termed *supraœsophageal*, and is united by filaments with other ganglia lying below the œsophagus, so as to form a ring or collar around that organ. The supraœsophageal ganglia furnish the nerves to the special organs of the senses. Most of the *M.* possess special *organs of touch* in the form of lips or of special lobes around the mouth; of tentacles or arms upon the head, or of cirri upon other parts of the body; and in addition to these special organs, the skin appears to possess considerable sensibility. When tentacles are present, they are either two or four in number; and they can be protruded and retracted at pleasure, as every one must have noticed in the case of these organs (popularly known as *horns*) in the snail. *Organs of sight* are not universally present. In many *M.*, there is only a single rudimentary eye, while in others there is a large number of imperfect eyes (termed *ocelli*), which do not of necessity lie in the region of the head. In the higher *M.*, there are two eyes, sometimes placed directly on the head, and sometimes on the tentacles; and in the highest group (the *Cephalopods*), the eyes are as fully developed as in fishes.

*Organs of hearing*, in a simple form, are almost always present. They usually consist of round vesicles in the neighborhood of the œsophageal ring, from which

they receive a nervous filament. They contain a clear fluid and a small concretion of carbonate of lime, which is sometimes roundish, and sometimes of a crystalline form, and is in a perpetual state of vibration, in consequence of ciliary action in the interior of the vesicle. Whether there are any special *organs of smell and taste* in the M., is still undecided.

The organs of *vegetative life* (of digestion, circulation, &c.) are much more fully developed in the M. than those of *animal life*. The alimentary canal, which presents almost every variety of form from a simple cavity to a complicated intestine, is always provided with two distinct openings, a mouth and an anus, the latter being often situated (as in the Gasteropoda and Pteropoda) on the right side of the anterior part of the body. The liver is always present, existing in a mere rudimentary form in the Polyzoa, constituting a large part of the body in the acephalous bivalve M. (as the mussel and cockle), and a still larger part in the Gasteropoda (as the snail), while in the Cephalopoda it is constructed upon nearly the same plan as in fishes. Other secreting organs, such as salivary glands, pancreas, and urinary organs, are also present in the more highly developed mollusca.

The circulation of the blood is effected (except in the Polyzoa) by means of a distinct heart, which usually communicates with a regular, closed vascular system; but in some cases the venous system is imperfect, and the blood which has been transmitted by the arteries to the system in general is not confined within distinct vessels, but meanders through sinuses or passages excavated in the tissues, and through them it reaches the respiratory apparatus, whence it is transmitted by closed vessels (veins) to the heart. The blood is nearly colorless (sometimes of light blue or green tint), and contains but few floating corpuscles. In all but the very lowest M., there is a distinct respiratory apparatus, which, excepting in the case of the terrestrial Gasteropoda (as, for example, the snail), is constructed with a view to aquatic respiration, and is composed of *branchiæ*, or gills. These branchiæ usually consist of a series of membranous plates (arranged like the leaves of a book or the teeth of a comb), over which the water flows. They are sometimes attached to the surface of the body, but are most commonly enclosed within the mantle, or placed in a cavity in its interior called the branchial or respiratory chamber. In many of the bivalves, the openings for the ingress and egress of water are prolonged into tubes or syphons, which are sometimes of considerable length; the tube through which the water enters being termed the *oral* syphon, while that through which it escapes is termed the *anal* syphon. In all the aquatic M. except the Cephalopoda, the renewal of the water in contact with the surface of the gills is mainly due to ciliary action. In the air-breathing gasteropodous M. (of which the snails and slugs are well-known examples), there is a pulmonary sac or bag, into which the air penetrates by an opening on the right side of the body near the neck.

There are considerable differences in the modes of *propagation* of the mollusca. In the Molluscoids—the Polyzoa and Tunicata—there is both propagation by gemination (like that of Zoophytes, q. v.) and sexual reproduction, the sexes being distinct in the Polyzoa, and united in the same individual (constituting Hermaphroditism, q. v.) in the Tunicata. In the Lamellibranchiata, or bivalve M., and in the Cephalopoda, the sexes are separate; while in the Gasteropoda the sexes are most commonly separate, although a considerable number are hermaphrodites, which, however, require mutual impregnation to fertilize the ova. The eggs vary greatly in form; in some cases, they are laid separately, but most commonly they are agglutinated together in a mass; while in some marine species many eggs are enclosed in a leathery capsule, while numerous capsules are united to form a large mass. A comparatively few M. produce living offspring, the ova being retained in the oviduct until the extrusion of the young animals.

The M. are widely diffused through time and space. They were amongst the earliest animal inhabitants of our globe, and are everywhere found in fresh and salt water (except at great depths), and in every latitude of the earth. The great majority are marine animals, and it is in the tropical regions that the largest and most beautiful forms are developed. It is impossible to form even an approximate estimate of the number of mollusca. According to Leunis ("Synopsis der drei Natur-reiche; erster Theil," 1860, p. 77), there are 16,733 living, and 4590 fossil species, exclusive of Polyzoa; and it is probable that only a small proportion of the naked or shell-less M. is yet known.

Moloch

180

The uses of many species of *M.* for food are too well known to require notice; and as bult for fishing, mussels and some other *M.* are of great value.

The animals of this sub-kingdom are divisible into the *Molluscoids* and the true *Mollusca*, the former being distinguished from the latter by the very low development of the nervous system, which is composed of only a single ganglion, giving off nerves in different directions; and by their propagating by gemination. The *Molluscoids* are divisible into: Class 1. *POLYZOA* or *BRYOZOA*. Examples—*Plumatella*, *Ficustra*. Class 2. *TUNICATA*. Examples—*Ascidia*, *Salpa*. The true *Mollusca* are divisible into: Class 3. *BRACHIOPODA* or *PALLIOBRANCHIATA*. Example—*Terebratulata*. Class 4. *LAMELLIBRANCHIATA*. Examples—*Oyster*, *Mussel*, *Cockle*. Class 5. *GASTEROPODA*. Examples—*Snail*, *Cowry*, *Limpet*, *Doris*. Class 6. *PTEROPODA*. Examples—*Clio*, *Hyalea*. Class 7. *CEPHALOPODA*. Examples—*Cuttle-fish*, *Nautilus*. The distinctive characters of these classes are given in separate articles.

The literature of this subject is very extensive. Amongst the most important works on the *M.* generally may be mentioned Cuvier, "Mémoires pour servir à l'Histoire et à l'Anatomie des Mollusques avec 85 pl." (Paris, 1817, 4to); Lamarck, "Hist. Nat. des Animaux sans Vertèbres," 2d edit., par Deshayes et Milne-Edwards (11 vols. 8vo); Woodward, "Manual of the Mollusca;" and the third volume of Bronn's great work, published at Leipzig in 1864, entitled "Classen und Ordnungen des Thierreichs;" while for information on the *M.* of Great Britain, the reader is especially referred to Forbes and Hauley, "Molluscan Animals and their Shells" (4 vols. 8vo); Gosse, "A Manual of Marine Zoology for the British Isles;" and Alder and Hancock, "Nudibranchiate Mollusca" (published by the Ray Society).

*Fossil Mollusca*.—The hard shells of most *M.* fit them for long preservation, and make them the most frequent organic remains in the fossiliferous rocks from the Silurian upwards. The tunicata and the nudibranchiate gasteropods, having no hard parts that could be preserved, are without fossil representatives; the glassy and translucent fragile shell of the pteropoda is only known fossil from a few species in the Tertiary strata; unless, indeed, the comparatively large forms (*Conularia* and *Theca*) from the older rocks have been rightly referred to this order. The remaining four orders—the Cephalopoda, Gasteropoda, Brachiopoda, and Lamellibranchiata—have existed together from the earliest period. The tetrabranchiate Cephalopoda were developed in great profusion and variety in the Paleozoic and Secondary periods; and as they decreased, the dibranchiate group took their place, and continued to increase in numbers until it reached its greatest development in the seas of our own day. Of the chambered shells like the pearly nautilus, it is estimated that over 1400 species are known, of which only five or six exist in the ocean now; the cuttle-fishes and squids, on the other hand, are represented in the Secondary and Tertiary rocks by about 100 species, while at least twice as many are known as living species.

The living Gasteropoda exceed the fossil in the proportion of 4 to 3. This disproportion will appear greater when we remember that the fauna of the present seas is set against the faunas of some thirty different periods, yet it must not be forgotten that we can never be acquainted with more than a fraction of the entire animal life of any bypast age. Almost contemporaneous with the first living organisms, this group has gone on increasing to the present time, when the numbers are so great that more than 8000 living species have been recorded. A genus of air-breathing univalves has been described by Lyell, from the coal-measures of Nova Scotia. A single species—a modern-looking *Phya*—has been obtained from the Purbeck limestone, the newest of the Secondary rocks. They are more frequent in Tertiary beds.

The Brachiopoda, or Lamp-shells, like the nautilus group, have their history chiefly written in the rocky tablets of the earth. Of 1800 known species, only 75 are living, and these are comparatively rare, or are at least found in inaccessible localities, whereas, in some periods of the earth's history, as when the chalk and mountain limestone beds were being formed, and especially during the Devonian period, the individuals abounded to an enormous extent. The genus *Lingula*, seven species of which live in the modern seas, can be traced through the intervening strata, down to the first fossiliferous bed, to which, indeed, it gives the name of "Lingula Bed;" but this species, though externally not to be distinguished from the existing shell, has a pedicle groove in the ventral valve—a character sufficient,

perhaps, for the establishment of a different genus. Indeed, none of the genera of the Palæozoic rocks still exist; the want of exact information is the only excuse for the continued application of the names of recent genera to the ancient inhabitants of the globe.

The *Couchifera* have been gradually increasing in numbers and importance from the earliest period, and they attain their maximum development in the existing seas. The more simple forms, with an open mantle, are common in the Palæozoic strata; the siphonated families, unknown in the older rocks, appear in considerable number in the Secondary strata, and continue to increase upwards. The recent species number about 3000, while the fossil are nearly twice as many.

**MO'LLWITZ**, a village of Prussian Silesia, in the government of Breslau, seven miles west of Brieg. Pop. 619. To the east of it lies the celebrated battle-field where Frederick II. of Prussia gained his first victory over the Austrians under Marshal Neipperg, April 10, 1741. According to the usual account, Frederick, on seeing his right wing and centre thrown into confusion and routed, put spurs to his charger, and fled from the field; but the advance of three battalions of Prussian infantry stopped the Austrians, while by this time Marshal Schwerin, who commanded on the Prussian left, routed the Austrian right wing, and compelled the whole to retreat. The Austrians suffered immense loss in killed, wounded, and prisoners. The immediate result of this victory was an alliance between France and Prussia, to dissolve which Austria was compelled to surrender the province of Silesia to Frederick, in 1743.

**MOLO**, a city of the Philippine Islands, on an island of the same name, four miles from Iloilo. See **PHILIPPINES**. In ancient times, it was a Chinese colony, and is now occupied by *Mestizos* and their descendants, most of them having a mixture of Chinese blood. Pop. 16,000.

**MOLOCH** (more correctly **MOLECH**), also **MILKOM**, **MALKOM** (*their king*), from Heb. *Melech*, king, the chief Ammonite deity (the Chemosh of the Moabites), whose worship consisted chiefly of human sacrifices, purifications, and ordeals by fire, mutilation, perpetual virginity, and the like; practices specially inveighed against in the Mosaic records. Even the stranger who should devote his offspring to this idol was to be put to death by stoning. It is not quite certain which was the particular manner of this sacrifice. Rabbinical tradition represents Moloch as a human figure of brass or clay, with a crowned bull's head, upon whose extended arms were laid the doomed children. A fire within the hollow statue soon scorched them to death, while their shrieks of agony were deadened by a loud noise made by the priests upon various instruments. But although this description nearly coincides with that of the statue of the Carthaginian Kronos, and although so late a traveller even as Benjamin de Tudela speaks of having seen the remains of an ancient Ammonite temple at Gehal, with the fragments of an idol somewhat corresponding to the above representation, yet nothing certain is known about this point at present; nay, even the burning of the children itself has been questioned; and it is contended, yet without much show of reason, that the victims were merely carried through two pyres of fire by way of solemn purification or baptism. It seems, however, certain that the worship of M. in whatever shape it may have been, was common throughout the Canaanite nations. The Carthaginians, through whom it was probably spread over the whole East, worshipped Kronos in rites of fire and bloodshed; and human beings, children or grown-up persons, prisoners or virgins, were either on certain periodical festivals, or on sudden emergencies, offered up throughout almost all the lands and islands which the merchant-people of antiquity may be supposed to have touched at. The description of the Kronian statue, as given by classical writers, differs only in that small respect from the one given above, that the child fell, according to the former, from the hands of the god into a burning fire below, instead of being slowly burned to death. On fire-worship in general, which is the main idea of "Moloch"—probably worshipped originally as the symbol of the sun—we have spoken under **GUEBRES**. The name itself gives no clue to its special nature, nor does any comparison with cognate roots lead any farther. Molech, or Melech, is the supreme king or deity of the people, who have enthroned him as their tutelary god. Naturally, the princes of Ammon are the princes of *Malcham*—their (the Ammonites') king or god, and his priests were high in social rank.

Moloch  
Moluccas

182

Respecting the special history of this worship among the Israelites, we can only say that, although we do not see any more reason to presuppose its wide spread at early times (on account of the frequent occurrence of the word "king" in doubtful passages), than there is the slightest ground for assuming (as has been done by Danmer and others) that the whole Mosaic religion originated in a Moloch-service (a notion which hardly required a serious refutation for its instant explosion)—yet there is no doubt that it had its secret, although few adherents, even before the Canaanite women in Solomon's harem reintroduced it publicly. The Valley of Hinnom and the Mount of Olives were the chief places of these abominable rites; the former being afterwards adopted as the name for Hell, even in Islam. Not until the time of Josiah was it rooted out from among the people. The word has now become a designation for a kind of irresistible dread influence, at whose shrine everything would be sacrificed, even as the deluded father offered his own child to the terrible idol.

**MO'LOCH**, a genus of saurian reptiles, of the family *Agamidae* (see ΑΓΑΜΑ). *M. horridus*, an Australian species, is perhaps the most ugly and repulsive in appearance of all the saurian tribes. The whole surface of the body is covered with irregular plates and strong sharp spines; the upper surface of the head is crowned with two very large spines; and on the back of the neck are large rounded protuberances, covered with granular scales and spines. The *M.* is, however, a perfectly inoffensive creature.

**MOLO'GA**, a district town in the west of the government of Jaroslav, in European Russia, is situated near the confluence of the Mologa and Volga, 68 miles west-north-west of Jaroslav. It is a town of great antiquity, and first belonged to the principality of Rostof, afterwards to Yaroslaf, but from 1321 till 1471, it had its own princes. There was formerly an extensive fair at Mologa. The timber-trade, and the carriage of goods by river-boats and rafts, now occupy the majority of the inhabitants. Pop. (1867) 8715.—The river Mologa is one of the links between the Volga and the Neva.

**MOLTKE**, Hellmuth, Count von, Field-Marshal of the German empire, and chief of the general staff, who planned the Prussian campaign of 1866 against Austria, and the German campaign of 1870—1871 against France. He belongs to an old family, who had their seat for centuries in Mecklenburg, where *M.* was born, 26th October 1800. Soon after his birth, his father, a military officer, left Mecklenburg, and acquired an estate in Holstein. He and his brother were sent to the military academy in Copenhagen, where iron discipline and military frugality laid the foundation of his later character. In 1822, he entered the Prussian army as cornet. His parents having by this time lost all their fortune, he was left without any means whatever, and had to undergo many hardships to maintain himself in his position, from the very modest pay the Prussian officers receive; yet he managed to save enough to take lessons in modern languages, which afterwards proved of great advantage to him. His eminent abilities soon procured him a place in the general staff. The time between 1835 and 1839, he spent in Turkey and Asia Minor, whither he was sent by the Prussian government to report on the war between that country and Mehemet Ali. Several anonymous publications of his, descriptive of the country and the war, are worthy of notice. After his return, he rapidly advanced through the different stages to the rank of general, continuing, however, on the general staff. His wonderful strategical powers were of immense service in the wars with Denmark (1863—1864), Austria (1866), and France (1870—1871); bringing them all to triumphant issues. At the end of the Austrian war he was rewarded with the order of the Black Eagle, in 1870 he was created a count, and in 1871 he was raised to the rank of field-marshal. He published a work on the Franco-German War. *M.* is a man of great modesty and simplicity; he is reserved, and so little given to talk, that he has acquired the surname of "the Silent." The same composure and equanimity that he possesses in council, he also preserves in the heat of battle. See GERMANY.

**MOLU'CCAS**, or Royal Islands, properly so called are Ternate, Tidore, Makian, Motir, and Batjan, lying to the west of Gilolo, and washed by the Moluccas Strait or Passage, which separates Gilolo from Celebes.—Ternate, the most important, is a volcanic mountain with planes at its base. The top is in 0° 48' 80" n. lat., and 127° 20'

80' e. long. Area, 23½ sq. m. Pop. 8594, of whom 109 are Europeans. The town is on the east side and contains the sultan's palace, the Dutch residency, Protestant church, government school, &c. The island is fertile and well watered; the natives peaceful. They cultivate rice, cotton, tobacco, &c., trade with the adjacent islands, and build vessels, from the light skiff and the tent-boat to the war-galley of 60 or 80 rowers, carrying two or more pieces of light artillery.—Tidore is south of Ternate, its north point being 1° 11' n. lat., and 126° 1' e. long. Area, 33 sq. m. Pop. 8157. The island is a volcano, 5532 feet high, and fertile for 3000 feet. The natives are less gentle, but more industrious than those of Ternate, and diligently cultivate the soil, weave, and fish. They are Mohammedans, and have many mosques. The sultans of Ternate and Tidore are subsidised by and subject to the Netherlands, exercising their authority under the surveillance of the Resident.—Makian lies in 0° 18' 30' s. lat., and 127° 24' e. long., is very fertile, yields much sago, rice, tobacco, canary-oil, &c., and has important fishings. Pop. 5000. The natives are industrious, make good nets, spin yarns, and weave coarse striped fabrics.—Further north, in 0° 23' n. lat., and 127° 9' 30' e. long., is Motir, which formerly yielded a considerable quantity of cloves, and later, sent much earthenware to all the Spice Islands.

Batjan, the only remaining Royal Island, lies between 0° 18'—0° 55' s. lat., and 127° 22'—128° e. long., is 50 miles in length, and 18 in breadth, has many mountain peaks from 1500 to 4000 feet in height, the sources of numerous rivers. The greatest part of this beautiful island is covered with ebony, satin-wood, and other valuable timber trees, which give shelter to numerous beautiful-plumaged birds, deer, wild hogs, and reptiles. Sago, rice, coconuts, cloves, fish, and fowls are plentiful, and a little coffee is cultivated. Coal is abundant, gold and copper in small quantities. The inhabitants, 1800, who are lazy and sensual, are a mixed race of Portuguese, Spaniards, Dutch, and natives. These islands are all volcanic, Ternate being a mountain sloping upwards to 5563 feet, to which Tidore bears a striking resemblance. Makian is an active volcano, which, so late as December 1861, threw forth immense quantities of lava and ashes, by which 326 lives were lost and 15 villages in part or in whole destroyed. Motir is a trachyte mountain, 2296 feet in height; and Batjan, a chain with several lofty peaks. Total population of the M. Proper, 23,551.

To the south-west of Batjan lie the Obi group, consisting of Obi Major, Obi Minor, Typha, Gonoma, Pisang, and Maya, of which Obi Major, in 1° 35' s. lat., and from 127° to 128° e. long., is by far the largest, having an area of 598 square miles. It is hilly and fertile, being covered, like the smaller islands of the group, with sago and nutmeg trees. They are uninhabited, and serve as lurking-places for pirates and escaped convicts. In 1671 the Dutch built a block-house called the Bril; and a few years later, the Sultan of Batjan sold the group to them for 800 dollars; but the station being found unhealthy, the company abandoned it in 1788.

THE MOLUCCAS, or SPICE ISLANDS, in the broad use of the term, lie to the east of Celebes, scattered over nearly eleven degrees of lat. and long., between 3° s.—8° n. lat., and 126°—136° e. long., including all the territories formerly ruled over by the sultans of Ternate and Tidore. They are divided into the residencies of Amboyna (q. v.), Banda (q. v.), and Ternate; a fourth residency being Menado (q. v.). Over the northern groups of the Spice Islands, the Netherlands exercise an indirect government, the sultans of Ternate and Tidore requiring to have all their appointments of native officials ratified by the Resident. The southern groups are directly under European rule. The residency of Amboyna contains that island, sometimes called Ley-Timor, or Hitu, from the two peninsulas of which it is formed, Burn, the Uliassers group, and the west part of Ceram. That of Banda includes the Banda, Keffing, Key, Arru, and other islands, also the eastern portions of Ceram.

Under the residency of Ternate are placed the M. Proper, Gilolo, the neighboring islands, and the north-west of Papua. In 1871, pop. of the M. and dependencies, 4214 Europeans and 795,560 natives.

Amboyna, the Banda and Uliassers Islands, chiefly supply the cloves, nutmegs, and mace which form the staple exports. The Banda Islands are Neira or Banda-Neira, Grati Banda, Ay or Way, Rinn, Rozingain, and Goenong-Api, containing an area of 588 square miles. In 1857, pop. 6101, of whom 400 were Europeans; that of the whole residency, 110,802, including the eastern part of Ceram. The principal island of the group is Neira, south-east from Amboyna, in 4° 38' s. lat., and 130° e.

long., separated by narrow straits from Goenong-Api on the west, and Great Banda on the east. The coast is steep, and surmounted by several forts and batteries, which command the straits and roadstead. The town of Neira, on the south side of the island, is the capital of the Dutch residency of Banda, has a Protestant church, school, and hospital. The Banda Islands have a rich soil, and are planted with nutmeg-trees, producing, in 1860, upwards of a million lbs. of nuts, and 276,586 lbs. of mace. The culture has nearly doubled since 1851. Pine-apples, the vine, banana, cocoa-nut, and other fruit trees thrive, and are abundant. Ay is the prettiest and most productive of the group. Goenong-Api is a lofty volcano. There are wild cows, hogs, and deer; sea-carp and mackerel, which last are dried, and form with sago the food of the slaves. The east monsoon begins in May, and the west in December, and are accompanied with rain and storms. The climate is not particularly healthy.

The Ullassers, which with Amboyna, produce the cloves of commerce, are Saparoua, Oma or Haroukou, and Nouea-Laut. They lie to the east of Amboyna in 3° 40' s. lat., and 128° 33' e. longitude, and have an area of 107½ square miles. Saparoua is the largest, and is formed of two mountainous peninsulas, joined in the middle by a narrow strip of undulating grassy land. Recently there were about 100,000 trees, producing 185,000 lbs. of cloves. The population amounts to 11,685, of whom 7340 are Christians, and have 12 schools, with a very large attendance of scholars.—Oma, separated from Saparoua by a strait of a league in width, has eleven villages, of which Harouka and Oma are the chief. It is mountainous in the south, and has several rivers and sulphurous springs. The produce of cloves has amounted in one year to 40,000 lbs.; and the villagers possess 50,000 cocoa palms, besides other fruit-trees. The woods abound with deer and wild hogs, the rivers with fish. Sago is grown, but not in sufficient quantities to meet the wants of the people, who draw further supplies from Ceram. The beautiful village of Harouka, on the west coast, is the residence of the Dutch-Postholder, who is president of the council of chiefs. Here is the head office of the clove-produce. There are two forts on Oma, several churches, and six schools, with 700 pupils. Pop. 7188, one-half Christians, the other Mohammedans.—Nouea-Laut lies to the south-east of Saparoua. It is planted with clove-trees, which in one year produced 120,000 lbs. There are upwards of 30,000 cocoa-nut trees. The inhabitants, who formerly were pirates and cannibals, amount to 3479 souls, are all Christians, and have schools in every village—in 1859, they were attended by 870 pupils.

The clove-tree and the nutmeg are indigenous to all the Spice Islands, but the clove-cultivation is confined to Amboyna and the Ullassers, the nutmeg to the Banda Islands. Till 1834, the Dutch prohibited the planting of these trees in other parts, and caused those of native growth to be rooted out, in order to prevent smuggling, and to retain the supply of these spices to the European market. The Spice Islands are generally healthy both for Europeans and Asiatics; and though the plains are sometimes very hot, mountains are always near, where it is pleasantly cool in the mornings and evenings. Besides the spice-trees, the bread-fruit, sago, cocoa-nut, banana, orange, guava, papaw, also ebony, iron-wood, and other valuable timber-trees, are abundant. The natives of some of the islands are Alfouers, of others, Malays on the coasts, and Alfouers in the interior. In Ceram are also Papuan negroes, brought originally from Bali and Papua as slaves.

The Resident and other Dutch officials reside in the city of Amboyna, the streets of which are broad, planted with rows of beautiful trees, and cut each other at right angles. There are two Protestant churches, a town-house, orphanage, hospital, and theatre, besides a useful institution for training native teachers, with which is connected a printing-press. Near the city are beautiful promenades and country-seats. Pop. 10,500.

In 1554, the clove-produce amounted to 580,592 lbs., the number of trees planted being 405,639, of which one-third part were fruit-bearing; nutmegs, 587,861 lbs., and mace, 183,986 lbs.; the trees planted being 424,573, of which 297,373 were bearing. The total cost of the nutmegs and mace delivered in the Netherlands that year was £30,768 sterling, realising £94,466. In 1859, the M. sent to Java for the account of government, 2013 picols of mace (the picol = 138 lbs.), 81,101 of cloves, 6636 of nutmegs, and 28 of cocoa-nut soap; the value being £59,416. The produce of nutmegs, in 1851, was 463,309 lbs.; in 1859, it had risen to 832,634, and in 1867, to 1,044,657.

The clove-crop varies much, as the following table will shew: 1856, 617,250 lbs.; 1857, 187,098  $\frac{1}{2}$ ; 1858, 228,518; 1859, 890,888; 1860, 258,117. Amboyna and Banda have been free ports since 1864; but as government monopolises the labor, there is no fair competition, and the people are slaves of the soil, their chiefs being paid in proportion to the produce delivered.

In 1521, Antonio de Brito first appeared to take possession of the M. in the name of the king of Portugal; and after a long period of violence, intrigue and perfidy, the Portuguese were driven out by the Dutch and natives, at the beginning of the 17th century. The change was of no advantage to the natives, for the Dutch, having obtained the exclusive right of buying all the cloves, at a nominal value, a series of wars ensued, which resulted in the subjugation of the Spice Islands. Recently, new Sultans of Ternate and Tidore have been appointed, with less power than their predecessors; and the wars with the Alfoers of Ceram, in 1859 and 1860, have brought them more fully under Dutch rule.

**MOLYBDENUM** (sym. Mo; equiv. 48—new system, 96; sp. grav. 8.62) is a rare metal, which, in a state of purity, is of a silvery white color, has a strongly metallic lustre, is brittle, and very difficult of fusion. It never occurs native, and its principal ore is the bisulphide, which much resembles graphite. It is also occasionally found oxidised, in molybdate of lead. The metal may be obtained by roasting the bisulphide in a free current of air, when the sulphur goes off oxidised as sulphurous acid, and the M. is also oxidised into Molybdic Acid ( $\text{MoO}_3$ ), and remains in the vessel. By the action of charcoal, the reduced metal is then obtained from the acid.

M. forms three compounds with oxygen—the protoxide ( $\text{MoO}$ ), the blueoxide ( $\text{MoO}_2$ ), and molybdic acid ( $\text{MoO}_3$ ). Of these three, the last alone has any practical value. Molybdic acid is a white, glistening, crystalline powder, which is almost insoluble in water, fuses at a red heat, and unites with bases to form well-marked salts, the molybdates, which are either colorless or yellow. A solution of molybdate of ammonia is one of the most delicate tests for phosphoric acid.

M. forms various compounds with sulphur, chlorine, &c., none of which are of any practical importance, except the native bisulphide.

**MOMBA'SSA**, or Mombaz, a seaport town of East Africa, in the territory of the Sultan of Zanzibar, on a small coralline island off the coast, in the middle of an estuary formed by two small rivers, in lat.  $4^{\circ} 4'$  s., and long.  $39^{\circ} 43'$  e., about 150 miles north of Zanzibar Island. The shores of the island are rocky and abrupt; and although the channel may be forded at low water, the attempt is attended with danger. The town has the usual Arab characteristics of ruin, neglect, and filth in a striking degree. The only object of interest is an extensive fort, built on a rock, cut perpendicularly, in 1506, by the Portuguese, and restored by them in 1635, as an inscription over the principal gateway indicates. It is a work of considerable pretension, with upwards of one hundred guns in position, but in a ruinous condition. The inhabitants, the majority of whom are sunk in abject poverty, mostly live in wretched hovels, scattered among what remains of the once magnificent buildings. The town and island of M., as well as the surrounding district, is inhabited by the Wanika tribe. The harbor is still good, and is commodious and safe. M. was visited by Vasco da Gama in 1497, when he found it to be a large and very prosperous town. It was held by the Portuguese during the greater part of the period from 1522 to 1720, when it appears to have become independent. The English held it from 1824 to 1836, when they resigned it. Since then, it appears to have been possessed by the Sultan of Zanzibar, and apparently is considered a place of some importance. Burton says that the inhabitants of M. "are justly taxed with pride, bigotry, evil-speaking, insolence, turbulence, and treachery by other Arabs." Pop. 12,000 to 15,000.

**MOMENT**, of any physical agency, is its importance with reference to some special application. Thus, the moment of a force applied (perpendicularly) to a lever, is the importance of the force as regards turning the lever about its fulcrum. It is, as we know (see **LEVER**), proportional to the product of the force by the distance of its point of application from the fulcrum. The moment of a force about any axis (to which its direction is perpendicular) is the product of the force by its least distance from the axis; and a similar definition is laid down for moment of velocity and moment of momentum. It is easy to see (see **MOMENTUM**) that in any system

of mutually acting bodies the moment of momentum about any axis remains constant, since the equal mutual forces measure the momentum transferred from one body to another, and the moments of these forces are in pairs equal and opposite. A particular case of this is Kepler's law, that each planet describes equal areas in equal times about the sun.

**Moment of Inertia.**—In the rotation of bodies round an axis, the moment of inertia is the sum of the products of each particle of the body into the square of its distance from the axis; or if  $M$  be the body,  $m_1, m_2, m_3$ , &c., the particles composing it, and  $r_1, r_2, r_3$ , &c., their corresponding distances from the axis, then the moment of inertia of  $M = m_1 r_1^2 + m_2 r_2^2 + m_3 r_3^2 + \dots$ ; and if a quantity,  $k$ , be found such that  $Mk^2 = m_1 r_1^2 + m_2 r_2^2 + m_3 r_3^2 + \dots$ , then  $k$  is called the *radius of gyration*. See CENTRE OF GYRATION.

**MOMENTUM**, or Quantity of Motion, is defined by Newton as proportional to the mass moving, and its velocity, conjointly. If we assume unit of momentum to be that of unit of mass moving with unit of velocity, we shall evidently have, for the momentum of a mass  $M$ , moving with velocity  $V$ , the expression  $MV$ . And such is the unit generally adopted.

It is shown by experiment that, when force produces motion in any body, the momentum produced in one second is proportional to the force—and, in fact, *forces is measured by the momentum it is capable of producing in unit of time*. Thus, the same force, if acting for one second on each of a number of bodies, produces in them velocities which are *inversely* as their masses. Also when, as in the case of falling bodies, the velocities produced in one second are the same in all, we conclude that the forces are *proportional* to the masses; and, in fact, this is the physical proof that the weight of a body is proportional to its mass. Again, if different forces act, each for a second, on the same mass, the velocities produced are proportional to the forces. All these are but different modes of statement of the experimental fact, that force is proportional to the momentum it produces in unit of time; which forms a part of Newton's second Law of Motion.

When two masses act on each other, Newton's third Law of Motion (see MOTION, LAWS OF) shews that the forces they mutually exert are equal and opposite. The momenta produced by these must therefore be equal and opposite. Thus, in attraction or impact of two masses, *no momentum is lost*; since what is lost by one is gained by the other.

The momentum of a system of bodies can be resolved (as velocity is resolved) into components in any assigned directions, and the mutual forces of the system may be thus likewise resolved. Applying the previous result, we see at once that in any system of mutually acting bodies (such, for instance, as the solar system), no momentum is, on the whole, either gained or lost in any particular direction, it is merely transferred from one part of the system to another.

This fact, called the Conservation of Momentum, has caused great confusion in the minds of pseudo-physicists, who constantly confound it with Conservation of Work or Energy, a totally different thing.

The momentum produced by a force in any period of time is measured by the product of the force and the time during which it has acted—the energy or work done by a force is measured by the product of the force and the space through which it has acted. Momentum is proportional to the simple velocity of a body, and *can never, by any known process, be transformed into anything else*. Energy, when depending on velocity (see FORCE, CONSERVATION OF), is proportional to the square of the velocity, and is in the natural world constantly being transformed from its actual or kinetic form to its potential form, and back again, or to some other kinetic form such as heat, and finally must become heat. Momentum, on the contrary, is never altered, either in kind or in amount.

In knocking down a wall, or in staving in the whole side of a ship, the battering-ram of the ancients (when constructed of sufficient mass, and worked by the proper number of men or animals) was probably nearly as effective as the best modern artillery. But in making a breach in a wall, or in punching a hole in the armor of an iron-clad, mere massive shot with low velocities (such as those of the Dahlgren guns) are comparatively ineffective, however great their momentum; while an Armstrong or Whitworth projectile, with a fraction of the momentum, but with greater velocity, and, for its size, much greater kinetic energy, effects the object with ease.

In many every-day phenomena, we see most distinctly the difference between these two affections of matter. Thus, a blow delivered from the shoulder by a *heavy* pugilist, even if it be sluggishly given, generally floors its man, without doing much other injury; but a sharp stroke administered by a light weight, while hardly disturbing the adversary's equilibrium, inflicts serious punishment.

MOMMSEN, Theodor, a distinguished writer on the history and polity of ancient Rome, was born in 1817 at Gardlug, in Sleevig, where his father was a pastor in the Lutheran Church. M. studied first at Altona, and subsequently at the university of Kiel, where he graduated in arts in 1843. Having obtained some assistance from the Academy of Berlin to defray the expenses of a prolonged course of travels, M. spent three years in investigating Roman inscriptions in France and Italy, and from time to time published the result of his investigations in the *Annals of the Archaeological Institute of Rome* and the *Herculean Academy of Naples*. The political disturbances of 1848 diverted M. from his favorite pursuits; and for a time he devoted himself to politics, taking upon himself the editorship of the leading *Slesvig-Holstein paper*, for which he wrote the leading articles in the summer of 1848. M. held for a short time a chair in the university of Leipsic, but his appointment was cancelled on account of his strong political tendencies. He was made Titular Professor of Law at Zurich in 1852, and at Breslau in 1854; while, since 1858, he has filled the chair of Roman Law at Berlin. His attention has long been devoted to those branches of archaeology and ancient history with which his name is now so honorably associated. Among his most valuable contributions to these departments of knowledge, special mention must be made of the following: "*Die Universalhistorischen Dialekte*" (Leip. 1850), "*Corpus Inscriptionum Neapolitanarum*" (Leip. 1851); his monographs on "*The Chronography of the year*" 354, and "*Roman Coins*" (Leip. 1850); the edict of Diocletian, "*De Pretiis Rerum Venalium*" A. 301 (Leip. 1851); "*Inscriptiones Regni Neapolit.-Latinae*," 1852 "*Die Rechtsfrage zwischen Caesar und d. Senat*," 1857; his great work on Roman History, "*Röm. Geschichte*," 5th edition, 1868—1870 (ably translated into English by W. P. Dickson); "*Römische Forschungen*," articles on special points of Roman antiquities (1st vol., Berlin, 1864); "*Römisches Staatsrecht*" (1st vol., Leip. 1871); "*Die Erzählung von Cains Martius Coriolanus*;" and his "*Digesta Justiniani Augusti*" (Berlin, 1868—1870).

MOMORDICA, a genus of plants of the natural order *Cucurbitaceae*, having lateral tendrils, and the fruit splitting when ripe. *M. Balsamina*, a native of the south of Europe and of the East, produces a curious, oblong, much-warted fruit, called the *BALSAAM APPLE*, which, when green, is infused in oil, to form a vulnerary much esteemed in Syria and some other countries. The ripe fruit is a dangerous poison. The plant is used to form arbors.—The large, red, thorny fruit of *M. mizta*, called *Gol-takra* in India, is there used for food.—*M. echinata* is called the *Gooseberry Gourd*, because its fruit, which is covered with bristles, is about the size and shape of a large gooseberry. The unripe fruit is used for pickling, and is sometimes to be seen in Covent Garden market.

MOMPOX, a town of the United States of Colombia, on the Magdalena, 110 miles south-east of Cartagena. Here the Magdalena, during its periodical floods, rises 12 or 15 feet above its usual level; and the quay and custom-house of M. are built unusually high, in order to provide against this emergency. All the foreign goods destined for the consumption of the Valley of the Magdalena pass through this town. Pop. estimated at 10,000.

MONACHISM (Gr. *monachos*, a monk, from *monos*, alone) may in general be described as a state of religious retirement, more or less complete, accompanied by contemplation, and by various devotional, ascetical, and penitential practices. It is, in truth, ASCETICISM (q. v.), with the element of religious solitude superadded. The institution of monachism has, under different forms, entered into several religious systems, ancient and modern. That it was known among the Jews before the coming of our Lord, appears from the example of the prophet Elias, and from that of the Essenes; and it is probable that religious seclusion formed part of the practice of the NAZARITES (q. v.), at least in the later periods of Jewish history. In the Brahmanical religion, it has a promi-

ment place; and even to the present day, the *laseries* of T<sup>un</sup> may be said to rival in number and extent the monasteries of Italy or Spain. The Christian advocates of monachism find in the gospel exhortations to voluntary poverty (Matt. xix. 21) and to celibacy (1 Cor. vii. 37), at once the justification and the origin of the primitive institution. Its first form appears in the practice of asceticism, of which we find frequent mention in the early part of the 3d century. The primitive ascetics, however, lived among the brethren, and it is only in the following century that the peculiar characteristic of monachism begins to appear. The earliest form of Christian monachism is also the most complete—that already described under the head ANCHORITES (q. v.); and is commonly believed to have in part originated in the persecutions, from which Christians were forced to retire into deserts and solitary places. The anchorites maintained from choice, after the cessation of the persecutions, the seclusion to which they had originally resorted as an expedient of security; and a later development of the same principle is found in the still more remarkable psychological phenomenon of the celebrated PILLAR-SAINTS (q. v.). After a time, however, the necessities of the religious life itself—as the attendance at public worship, the participation of the sacraments, the desire for mutual instruction and edification—led to modifications of the degree and of the nature of the solitude. First came the simplest form of common life, which sought to combine the personal seclusion of individuals with the common exercise of all the public duties; an aggregation of separate cells into the same district, called by the name *Laura*, with a common church, in which all assembled for prayer and public worship. From the union of the common life with personal solitude is derived the name *cenobite* (Gr. *κοινος βίος*, common life), by which this class of monks is distinguished from the strict solitaries, as the anchorites or eremites, and in which is involved, in addition to the obligations of poverty and chastity, which were vowed by the anchorites, a third obligation of obedience to a superior, which, in conjunction with the two former, has ever since been held to constitute the essence of the religious or monastic life. The first origin of the strictly cenobitical or monastic life has been detailed under the name of ST ANTHONY (q. v.), who may be regarded as its founder in the East, either by himself or by his disciples. So rapid was its progress, that his first disciple, PACHOMIUS (q. v.), lived to find himself the superior of 7000. In the single district of Nitria, there were no fewer than 50 monasteries (Sozomen, "Eccles. History," vi. 81), and before long, the civil authorities judged it expedient to place restrictions on their excessive multiplication. It seems to be admitted, that, in the East, where asceticism has always been held in high estimation, the example of Christian monasticism had a powerful influence in forwarding the progress of Christianity; although it is also certain that the admiration which it excited occasionally led to its natural consequence among the members, by eliciting a spirit of pride and ostentation, and by provoking, sometimes to fanatical excesses of austerity, sometimes to hypocritical simulations of rigor. The abuses which arose, even in the early stages of monachism, are deplored by the very Fathers who are most eloquent in their praises of the institution itself. These abuses prevailed chiefly in a class of monks called *Sarabaites*, who lived in small communities of three or four, and sometimes led a wandering and irregular life. On the other hand, a most extraordinary picture is drawn by Theodoret, in his "Religious Histories," of the rigor and mortification practised in some of the greater monasteries. The monks were commonly zealots in religion; and much of the bitterness of the religious controversies of the East was due to that unrestrained zeal; and it may be added that the opinions which led to these controversies originated for the most part among the theologians of the cloisters. Most famous among these were an order called *Acemetae* (Gr. *σκηπτες*, sleepless), from their maintaining the public services of the church day and night without interruption. See MONOPHYTES, MONOTHEISM, NESTORIANS, IMAGE-WORSHIP.

It was in the cenobitic rather than the eremitic form that monachism was first introduced into the West, at Rome and in Northern Italy by Athanasius, in Africa by St Augustine, and afterwards in Gaul by St Martin of Tours. Here also the institute spread rapidly under the same general forms in which it is found in the Eastern Church; but considerable relaxations were gradually introduced, and it was not until the thorough reformation, and, as it may be called, religious revival effected by the celebrated ST BENEDICT (q. v.), in the beginning of the 6th c., that western monachism assumed its peculiar and permanent form. In some of the more isolated

churches, as, for instance, that of Britain, it would seem that the reformations of St Benedict were not introduced until a late period; and in that church, as well as in the church of Ireland, they were a subject of considerable controversy. One of the most important modifications of monachism in the West, regarded the nature of the occupation in which the monks were to be engaged during the times not directly devoted to prayer, meditation, or other spiritual exercises. In the East, manual labor formed the chief, if not the sole external occupation prescribed to the monks; it being held as a fundamental principle, that for each individual the main business of life was the sanctification of his own soul. In the West, besides the labor of the hands, mental occupation was also prescribed, not, it is true for all, but for those for whom it was especially calculated. From an early period, therefore, the monasteries of the West, and particularly those of Ireland, or of the colonies, founded by Irish monks, as Iona and Lindisfarne, became schools of learning, and training-houses for the clergy. At a later period, most monasteries possessed a *scriptorium*, or writing-room, in which the monks were employed in the transcription of MSS.; and although a great proportion of the work so done was, as might naturally be expected, in the department of sacred learning, yet it cannot be doubted that it is to the scholars of the cloister we owe the preservation of most of those among the master-pieces of classic literature which have reached our age.

In the remarkable religious movement which characterised the church of the 12th c. (see FRANCIS OF ASSISI, FRANCISCANS), the principle of monachism underwent a further modification. The *spiritual egotism*, so to speak, of the early monachism, which in some sense limited the work of the cloister to the sanctification of the individual, gave place to the more comprehensive range of spiritual duty, which, in the institute of the various bodies of FRIARS (q. v.) which that age produced, made the spiritual and even the temporal necessities of one's neighbor equally with, if not more than, one's own, the object of the work of the cloister. The progress of these various bodies, both in the 12th c. and since that age, is detailed under their several titles. It only remains to detail the later history of monachism, properly so called. The monastic institutes of the West are almost all offshoots or modifications of the BENEDICTINES (q. v.); of these, the most remarkable are the CARTUSIANS, CISTERCIANS, GRANDMONTINES, CLUGNIACS, PREMONSTRATENSIA, and above all MAURISTS, or Benedictines (q. v.) of St Maur. In more modern times, other institutes have been founded for the service of the sick, for the education of the poor, and other similar works of mercy, which are also classed under the denomination of monks. The most important of these are described under their several heads.

The enclosure within which a community of monks reside is called a MONASTERY (q. v.)—Gr. *monasterion*, Lat. *monasterium*. By the strict law of the church, called the law of cloister or enclosure, it is forbidden to all except members of the order to enter a monastery; and in almost all the orders, this prohibition is rigidly enforced as regards the admission of females to the monasteries of men. To such a length is this carried in the Greek Church, that in the celebrated enclosure of Mount Athos, not only women, but all animals of the female sex are rigorously excluded. The first condition of admission to a monastic order is the approval of the superior, after which the candidates remain for a short time as *postulants*. After this preliminary trial, they enter on what is called the *novitiate*, the length of which in different orders varies from one to three years; and at its close they are admitted to the profession, at which the solemn vows are taken. The age for profession has varied at different times and in different orders; the Council of Trent, however, has fixed 16 as the minimum age. Originally, all monks were laymen; but after a time, the superiors, and by degrees other more meritorious members, were admitted to holy orders. The distinction of priest-monks and lay-brothers has been already explained under the head FRIAR; but in both alike, where the order is one of those solemnly approved by the church, the engagement taken at the final profession is life-long and irrevocable.

The monastic institute, from the very earliest time, embraced women as well as men. The former were called in Greek by the name *nonis* or *nonna*, and in Latin *nenna* (from which the English *nun*), as also *sanctimonialis*. The cloistered residence of nuns is called by various names, as NUNNERY, CONVENT, a name also applied to the houses of men. The general characteristics of the monastic institute for females are substantially identical with those of the male orders; and as the princi-

Monaghan

190

pal varieties of institute are detailed under their respective heads, it is needless to particularise them here.

It is hardly necessary to say that the reformed churches in the 16th c. discarded the practice of monachism, and suppressed the monastic houses. In some of the German states, the temporalities of the suppressed monasteries were retained, and were granted at pleasure by the sovereign, to be enjoyed together with the titular dignity. Some of the German churches, however, in later times, have revived the institute both for men and for women, as has also been done in the Anglican Church both in the time of Laud and in our own day. In all these Protestant revivals of monachism, however, the engagement is revocable at the will of the individual. At the French Revolution, the monastic establishments of France were utterly suppressed; and in most of the other Catholic countries of Europe, the example has been followed to a greater or less extent. In England and Ireland and America, on the contrary, the institute has made rapid progress within the last 20 years. Most of the orders, however, introduced into these countries are of the active rather than of the contemplative class.

**MONACO**, a small principality of Italy, on the coast of the Mediterranean Sea, a few miles north-east of the city of Nice. The climate is fine, so that oranges, lemons, &c. are produced in abundance. Population (1873) 5741. From the 10th to the 18th c., M. was held by the Genoese family of Grimaldi. In 1515, it was ceded to Sardinia, which, however, recognised its independence, but reserved to itself the right of garrisoning the town of Monaco. At this period, it consisted of three communes—Monaco, Mentone, and Rocca-bruna, with an area of 52 square miles, and a population of about 7000. In 1848, Mentone and Rocca-bruna were annexed to Sardinia, in spite of a protest by his "Serene Highness," Carlo Honorio, third prince of Monaco. The Italian war of 1859 placed the whole territory for a brief period under Victor Emmanuel; but Carlo Honorio having sold Mentone and Rocca-bruna (21 Feb. 1861) to the French emperor for 4,000,000 francs, Sardinia was obliged to renounce her hold upon them. The sovereign prince of M. now possesses nothing but the city and a small patch of territory, with a total area of 6 sq. m.; pop. (1873) 5741. The town is a beautiful place on a rocky promontory, with 2667 inhabitants.

**MONAD** (Gr. *monas*, unity), a term borrowed from the Peripatetic philosophy, although employed by moderns in a sense different from that of the Peripatetics, who used it to designate the universe, understood in the pantheistic sense. By moderns, and especially by LEIBNITZ (q. v.), from whose system alone the name has derived importance, it is used to describe the primary elements of all matter. The monads are simple uncompound substances, without figure, without extension, without divisibility, by the aggregation of which all bodies are formed, and into which all compounded things may ultimately be resolved. The monads are created things, but as being uncompound, are indestructible; and although subject to change, the change is but external or relative. They are of two classes—the first are destitute of consciousness, although possessing an internal activity which is called by the name of perception; the second possess, in addition to perception, a certain consciousness, which is called by the name of "apperception" or conscious-perception. The monads of this class are souls, and according to the degree of their consciousness is the distinction between the souls of the higher and those of the lower intelligences. The Deity is the PRIME MONAD, or MONAD OF MONADS. The theory of monads enters largely into the philosophic system of Leibnitz, and indeed furnishes the key to much in that system which is otherwise obscure.

**MONAD** (*monas*), the generic name of many kinds of microscopic organisms, very minute, and supposed also to be of very simple organisation. They appear, even under a powerful microscope, as mere points, moving rapidly through the fluid in which they exist, and often becoming aggregated in clusters; or they are seen to be gelatinous and globular, or nearly so, with a tail or thong-like filament, by the vibrations of which they move. When the fluid is tinted by means of some harmless coloring matter, the existence of several cells or vesicles is discerned within the minute body. Ehrenberg therefore classed them among Polygastric Infusoria (see INFUSORIA), and no naturalist doubted their right to a place, although one of the lowest, in the animal kingdom. They are now universally regarded as vegetable,

and are ranked among algae. The organisms formerly known as *Globe Animalcules* (*Volvox*) are clusters of monads produced by gemination from one, and invested with a common envelope. Monads are of various colors. Their gemination takes place according to fixed laws, so that the groups assume particular forms, characteristic of the different kinds. Thus, in the "Breast-plate Animalcule" (*Gonium pectorale*), so called from the form which the group frequently presents, a division takes place into four, and the number in a group is always either four or sixteen, a group of sixteen always dividing into four parts, each of which contains four monads.—The minute moving points often seen under the microscope are probably often not monads, but spores or germs.

**MONA'DNOCK**, Grand, a mountain in the south-west corner of New Hampshire, United States of America, which from a base of 5 by 3 miles, rises to a height of 3450 feet. It is composed of talc, mica, and slate, can be seen from the State House at Boston, and is a landmark at sea. Thirty lakes, some containing numerous islands, can be seen from its summit.

**MONAGHAN**, an inland county of the province of Ulster, Ireland, situated between Tyrone on the n., Armagh and Louth on the e., Meath and Cavan on the s., and Fermanagh on the w. Its greatest length from north to south is 37 miles; its greatest breadth, east and west, is 23; the total area being 500 square miles, or 319,751 acres, of which 285,866 are arable. The population, which in 1861 was 126,340, had fallen in 1871 to 114,970. The general surface is undulatory, the hills, except in the north-west and east, being of small elevation, although often abrupt; the highest point does not exceed 1254 feet above the sea. It is interspersed with lakes of small extent, and for the most part of little depth, and although the streams are numerous, there is no navigable river within its boundaries. In its geological structure, the level country belongs to the great central limestone district; the rest is of the same transition formation which is met with in the northern tract of Leinster. No minerals are found in a remunerative quantity; there is a small coal-field in the southern border, but it has not been found profitable to work. The soil is very varied in its character, and for the most part is wet and imperfectly drained, although commonly capable of much improvement; but in general it is found suitable for the production of cereal crops (with the exception of wheat, which is little cultivated), and of flax. The total area under crops in 1876 was 139,739 acres. There were 60,569 acres under oats, and 12,304 acres under flax. The cattle in the same year numbered 85,569; sheep, 15,999; pigs, 32,056. The annual valuation of property in 1874 was £262,432. M. is well supplied with good roads, and is connected by railway with Dublin, Belfast, and Galway, and directly with the coast at Dundalk. The Ulster Canal passes through the county. The principal towns of this county are Monaghan (q. v.), Carrickmacross, Clones, and Castle-Blaney. It returns two members to parliament, the constituency being, at the enumeration of 1873, 5608. M., at the invasion, formed part of the grant of Henry II. to De Courcay, and was partially occupied by him; but it speedily fell back into the hands of the native chiefs of the sept MacMahon, by whom (with some alternations of re-conquest) it was held 'till the reign of Elizabeth, when it was erected into a shire. Even still, however, the authority of the English was in many places little more than nominal, especially in the north; and in the rising of 1641, the MacMahons again resumed the territorial sovereignty. The historical antiquities of the county are of little interest or importance. It possesses two round towers, one very complete, at Clones, the other at Inniskeen; and there are many remains of the ancient earthworks commonly referred to the ante-English period. The total number of children attending the superior and primary schools in the county of M. during 1871 was 12,749, of whom 8586 were Roman Catholics.

**MONAGHAN**, chief town of the county of the same name, is situated on the great north line from Dublin to Londonderry, distant from the former 76 miles north-north-west. Pop. in 1871, 8632. M., before the Union, was a town of some importance, having a charter from James I., and returning two members to the Irish parliament. It is still the centre of an active inland trade, and can boast some public buildings of considerable pretensions, among which are the jail, market-house, and court-house. A Roman Catholic college and a cathedral dedicated to St Mic

Carthain, also deserve special notice. The general market is on Monday; 8 markets for agricultural produce are held weekly, and there is also a monthly fair.

**MONARCHY** (Gr. *monarchia*, from *monos*, alone, and *archō*, to govern; literally, the government of a single individual) is that form of government in a community by which one person exercises the sovereign authority. It is only when the king, or chief magistrate of the community, possesses the entire ruling power, that he is in the proper acceptance of the term a monarch. Most of the oriental governments past and present, Russia at present, and Spain and France as they were in the last century, are in this strict sense monarchies. The degenerate form of monarchy is tyranny, or government for the exclusive benefit of the ruler. When the head of the state, still possessing the status and dignity of royalty, shares the supreme power with a class of nobles, with a popular body, or with both, as in our own country, the government, though no longer in strictness monarchical, is called in popular language a mixed or limited monarchy, the term absolute monarchy being applied to a government properly monarchical. The highest ideal of government would perhaps be attained by an absolute monarchy, if there were any security for always possessing a thoroughly wise and good monarch; but this condition is obviously unattainable, and a bad despot has it in his power to inflict infinite evil. It therefore becomes desirable that a governing class, composed, if possible, of the wisest and most enlightened in the country, should share the supreme power with the sovereign. A limited monarchy has this advantage over an aristocratic republic, that in difficult crises of the nation's existence, royalty becomes a neutral and guiding power, raised above the accidents and struggles of political life.

Monarchy, most usually hereditary, has sometimes been elective, a condition generally attended with feuds and distractions, as was the case in Poland. The elective system is still followed in the choice of the pope. Constitutional monarchy may be in its origin elective, or combine both systems, as when one family is disinherited, and the sceptre declared hereditary in the hands of another under certain conditions. See **KING**, **REPUBLIC**.

**MONASTERY** has been described under the head of **MONACHISM** (q. v.) as the generic name of the residence of any body of men, or even, though more rarely, of women, bound by monastic vows. It may be useful, however, to detail the various classes of monastic establishments of the Western Church, and to point out the leading characteristics of each. The name, in its most strict acceptance, is confined to the residences of monks, properly so called, or of nuns of the cognate orders (as the Benedictine), and as such, it comprises two great classes, the *Abbey* and the *Priory*. The former name was given only to establishments of the highest rank, governed by an abbot, who was commonly assisted by a prior, sub-prior, and other minor functionaries. An abbey always included a church, and the English word *Minster*, although like the cognate German *Münster* it has now lost its specific application, has its origin in the Latin *monasterium*. A *Priory* supposed a less extensive and less numerous community. It was governed by a Prior, and was originally, although by no means uniformly, at least in later times, subject to the jurisdiction of an abbey. Many priories possessed extensive territorial domains, and of these, not a few became entirely independent. The distinction of abbey and priory is found equally among the Benedictine nuns. In the military orders, the name of *Commandery* and *Preceptory* corresponded with those of abbey and priory in the monastic order. The establishments of the Mendicant, and, in general, of the modern orders, are sometimes, though less properly, called monasteries. Their more characteristic appellation is *Priory* or *Convent*, and they are commonly distinguished into *Professed Houses* (called also *Residences*), *Novitiates*, and *Colleges*, or *Scholastic Houses*. The names of the superiors of such houses differ in the different orders. The common name is *Rector*, but in some orders the superior is called *Guardian* (as in the Franciscan), or *Master*, *Major*, *Father Superior*, &c. The houses of females—except in the Benedictine or Cistercian orders—are called indifferently *Convent* and *Nunnery*, the head of which is styled *Mother Superior* or *Reverend Mother*. The name *Cloister* properly means the enclosure; but it is popularly used to designate, sometimes the arcaded ambulatory which runs around the inner court of the building, sometimes, in the more general sense of the entire building, when it may be considered as synonymous with *Convent*.

**MONASTIR** (Toli-Monastir, or Bitolla), a town of European Turkey, capital of the vilayet named after it, is situated in a broad valley of the Nijl Mountains, 90 miles north-north-east of Janina, and about the same distance west-north-west of Saloniki. It is an important place, is the residence of the governor-general, and commands the routes between Macedonia and Northern Albania. The inhabitants are mostly Greeks and Bulgarians. M. has 11 mosques, and carries on a large trade with Constantinople, Saloniki, Vienna, and Trieste. From Constantinople alone it annually buys goods to the value of £1,500,000. Its bazaars, containing more than 2300 shops, are well stocked with the products of Western Europe and the colonies, as also with native manufactures. Yet it is one of the worst built and most tasteless towns in all Turkey. Pop. 34,000.

**MONASTIR**, a seaport town of North Africa, in the dominion of Tunis, 80 miles south-south-east of the city of that name, on the Gulf of Sidra. Woollen and camellet fabrics are manufactured, and there is some maritime trade. Pop. 12,000.

**MONBODDO**, James Burnet, Lord, a Scottish lawyer and author, was born at Monboddoo, in Kincardineshire, in 1714, educated at Marischal College, Aberdeen, where he displayed a great fondness for the Greek philosophers, and afterwards studied law for three years at Groningen, in Holland. In 1737, he became a member of the Scottish bar, and soon obtained considerable practice; but the first thing that brought him prominently into notice was his connection with the celebrated Douglas case, in which Mr Burnet acted as counsel for Mr Douglas. In 1767, he was raised to the bench by the title of Lord Monboddoo. He died 26th May 1799. M.'s first work, on the "Origin and Progress of Language" (1771—1776), is a very learned, heretical, and eccentric production; yet in the midst of its grotesque crotchets there occasionally flashes out a wonderfully acute observation, that makes one regret the distorted and misapplied talent of the author. The notion that men have sprung from monkeys, is perhaps that which is most commonly associated with the name of M., who gravely asserted that the orang-outangs are members of the human species, and that in the Bay of Bengal there exists a nation of human creatures with tails, and that we have only worn away ours by sitting on them, but that the stumps may still be felt. M. wrote another work, entitled "Ancient Metaphysics," which was published only a few weeks before his death.

**MONCADA**, Don Francisco de, Conde de Osoua, an historian, and one of the Spanish classics, born 29th December 1586, at Valencia, where his grandfather was then viceroy. Descended from one of the greatest families of Catalonia, he rapidly rose to the highest offices in the state, was ambassador to Vienna, and latterly governor of the Netherlands, and commander-in-chief of the Spanish troops there. He distinguished himself both as a statesman and a soldier. He fell at the siege of Goch, a fortress in the duchy of Cleves, in 1635. His "Historia de la Expedicion de Catalones y Aragoneses contra Turcos y Griegos" (Barcelona, 1623, and frequently reprinted), is a master-piece in liveliness and elegance of style.

**MONCALIERI**, a town of Italy in the province of Turin, situated finely on the slope of a hill, on the right bank of the Po, five miles above Turin. Pop. 3030. M. is the first railway station between Turin and Genoa, and communicates daily with Turin by frequent omnibuses; it has fine buildings, including a palace lately embellished for the residence of King Victor Emmanuel. The annual cattle-fair held in October, at M., is the most important of the north of Italy.

**MONDOVI**, an episcopal town in Cuneo, one of the northern provinces of Italy, situated on the summit and shoulder of an Alpine hill, 50 miles south of Turin. It is divided into four sections: the Piazza—encircled by walls, and containing the chief buildings of the place, and the suburbs, Carassone, Breo, and Piano del Valle. In the neighborhood, considerable activity exists in cloth, silk, and bonnet-straw manufactures; but in spite of vineyards and chestnut woods, the numerous remains of ruined buildings in its vicinity impart an air of desolation to the locality. The Piazza contains a fine cathedral, with rich paintings; an episcopal palace with a noble gallery of portraits; and the various judicial and educational halls. Pop. 1230. At the battle of M., on the 22d April 1796, the Sardians were totally defeated by Bonaparte, and the entrance into Piedmont secured to the French army. The province of M. is intersected by spurs of the Alps, and contains rich marble quarries and valuable mineral products.

**MONE'SIA BARK**, the bark of a tree (*Chrysophyllum glycyphllum*, or *C. Duranheim*), of the same genus with the Star Apple (q. v.), a native of the South of Brazil. The bark is lactescent; but when dried, it is thick, flat, compact, heavy, brown, and hard, with a taste at first sweet, afterwards astringent and bitter. A substance called *Monesia* is extracted from it, which is almost black, at first sweet, then astringent, and finally acrid. It is used as a stomachic and alterative in leucorrhœa, chronic diarrhœa &c. It contains, in small quantity, a principle called *Monesin*.

**MONEY**, in Political Economy. This is a word in continual use all over the civilised world, and perhaps there is none the meaning of which in connection with the business they have in hand is more distinctly understood by those who use it; and yet, on the other hand, there is none of which it is more difficult to give a comprehensive account or a strict definition. Presuming, then, that every one knows the practical use of the word in the affairs of common life, the best thing to be done here will be to point out a few distinctions which may tend to obviate confusion in the comprehensive use of the term as an element in economic science.

Money is often spoken of loosely as the same thing with capital; but they are different. Before anything is money, it must be such that you can go into the market and immediately use it in purchasing commodities or paying debts. The plant of a railway and the machinery of a mill, so long as they are in full use, are capital, and are capital which probably has once been money—but they are money no longer, because you cannot use them in making payments, though they have perhaps become more valuable than ever they were. The confusion of capital with money was the mistake made in issuing the French assignats on the security of the forfeited landed estates. Each assignat was a promise to pay; but when payment was demanded, it could not be made, because land was not a medium for making it. It is of the essence of money, then, that it is capable of making immediate payment either to satisfy a seller or a creditor. But an article may be money though it will not satisfy everybody; and articles available as money—even those most universally accepted as such—are available for other purposes. What we are familiar with as the most approved form of money—as the thing that will be most certainly received in payment all over the world—is coin of the precious metals. The reason why the claim of these is so universally accepted is, that they do not merely *represent* value, as we shall find other kinds of money do, but they really are value. If the dealer sells a hat for a sovereign, he knows that the sovereign does not depend, like a pound-note, on the solvency of the issuer, but that it has got value put into it by costing about as much labor and skill in bringing it into existence as the hat he gives for it. But even all coins perfectly available for value are not of the intrinsic value of their denomination. The silver for making 20 shillings is a good deal less valuable as a commodity than the gold in a sovereign, and in the same way, 240 pence, which are as money equal to a sovereign; only make a percentage of it in value as merchandise. The convenience of their use for small transactions makes up for depreciation in value of coins of the inferior metals, when gold is a standard; and to prevent incidental abuses, the law limits the extent to which they are a legal tender as good money.

Money transactions are distinguished from barter, in which one commodity is transferred for another, as when the shepherd, in primitive times, may be supposed to have given the agriculturist a sheep for a measure of corn. This distinction is extremely useful, since the invention of a circulating medium, which supersedes the narrow, cumbrous process of barter, by facilitating transactions of every variety of importance among all sorts of people, is a grand type of advance in civilisation. Like many other distinctions, however, it has not an absolute line of demarcation. The precious metals hold their value by their being commodities as well as being money, and coins are frequently used up for plate and jewellery. Where money is only available within one narrow region, its use verges on barter. In Central Africa purchases are made and debts paid by strings of beads or coils of brass wire. An ivory merchant or a traveller will lay in a stock of these, just as in Europe he would carry gold or circular notes. They are commodities, being used as ornaments by the inhabitants. But they are distributed to an extent far beyond the demand in this shape, and that they absolutely constitute money is shewn by this peculiarity in the case of beads, that a particular color will pass current, and another will not; so that the merchant who chooses the wrong kind,

though he have full value in merchandise, has not taken with him a supply of available cash.

Under the head of **BULLION**, it is shewn how the precious metals are an expensive form of money, which there is a temptation to supersede by paper-money. For the various opinions adopted by different classes of economists on paper-money, and the devices for getting over the great difficulty of rendering this kind of money secure, and equal in value to bullion, reference is made to the article **CURRENCY**. It may here be proper to state, that paper-money, or money founded on credit—one of the resources of advanced civilisation and complicated commerce—introduces a class of moneys so extensive and various, that it is impossible to mark the limits of its extent, or enumerate the shapes it may take. An attempt has been made to get rid of all difficulties by saying that a promise to pay is only the representative of money. But if it serve the purpose of buying or paying debt, it really is money. No one hesitates in counting a £5 Bank of England note as money. But a cheque by a person known to have a balance or credit at a solvent bank, is equally money; and though it is an order to pay, no actual bullion need ever be given for it, for the payment may be in notes, or the holder may hand it over to his own banker, in whose accounts it will be credited to the holder, and debited against the banker on whom it is drawn. The special difficulty as to paper-money is, that it may be mistaken for money when it is none, as in the case of a cheque not honored by payment; or, that it may be of less intrinsic value than it professes to be, as when there is what is called an over-issue (see **CURRENCY**). There are thus great risks attached to the use of paper-money; but there are also risks specially applicable to bullion-money, as light weight, base coin, and the absence of those facilities for detection in theft or fraud, which are among the advantages of paper-money. The special risks attending the use of paper have been shewn in practice to be so capable of remedy by legislative precautions, that at present, in Scotland, one-pound notes are taken with less suspicion than sovereigns. On transactions in general, the chance of loss from forgery or insolvency is deemed less than the chances from light weight, even if the risk of base coinage should not come into consideration.

Making allowance for coins sent abroad or used as metal, the money of Britain is calculated at: gold, seventy-five millions; silver and copper, thirteen millions; and notes, forty-two millions—in all, one hundred and thirty millions. But so large is the extent of paper-money, in the shape of drafts and bills, that of these payments, to the extent of more than two thousand millions in a year are settled at the London clearing-houses, or the establishments where the London banks, and those dealing with them, clear off their mutual obligations by paying over the balances.

**MONGE**, Gaspard, Comte de Péluse, a French mathematician and physicist, was born of humble parentage at Beaune, in the department of Côte d'Or, 10th May, 1746. When only fifteen, he went to study natural philosophy at the Oratorian College of Lyon, and afterwards obtained admission into the famous artillery school at Mézières, where he invented the method known as "Descriptive Geometry," which was at first received with incredulity, but afterwards with avidity, and, for a time, jealously kept secret by the military authorities. In 1772 M. became tutor and professor at Mézières; in 1780, he was chosen a member of the French Academy, and in the same year, was called to Paris as Professor of Hydrodynamics at the Louvre. As a lecturer, he was precise, clear, and brief; his style was a model of scientific rigor, if not of literary elegance. During the heat of the Revolution, he became Minister of Marine, but after a few months resigned the office. He did not, however, retire into obscurity, but took charge of the great manufactories improvised for supplying the million of soldiers whom republican France had launched against her enemies, with arms and gunpowder. At this critical period, he shewed himself possessed of a genius equal to the occasion. He was everywhere, animating, ordering, counselling, and directing the patriotic artisans. Yet it is characteristic of the insane fanaticism that, for a time, got the upper hand in France, that M. himself only escaped the guillotine on account of his services being absolutely indispensable. After he had founded the *Ecole Polytechnique*, he was sent by the Directory to Italy, and intrusted with the transport of the artistic spoils of the republican armies. Here he formed a close friendship with Bonaparte, whom he followed to Egypt. He now undertook the management of the Egyptian Institute. During the expedition to Syria, he performed the greatest services to the government estab-

lished at Alexandria. On his return to France, he resumed his functions as Professor in the Ecole Polytechnique, and, though his reverence for Napoleon continued unabated, he hotly opposed his aristocratic and dynastic views. The title of Comte de Péluze (Pelusium) was conferred on him by Napoleon, in memory of the Egyptian expedition. He died 28th July 1818. M.'s principal works are: "Traité Élémentaire de Statique" (7th edit. Paris, 1834); "Leçons de Géométrie Descriptive" (6th edit. Paris, 1837); and "Application de l'Analyse à la Géométrie des Surfaces du 1 et du 2 Degré" (4th edit. Paris, 1809). See Dupin's "Essai Historique sur les Services et les Travaux Scientifiques de Monge" (Paris, 1819).

**MONGHYR**, a city of India, capital of a district of the same name, is situated on the right bank of the Ganges, 30 miles west-north-west of Bhagulpur. It is a large and thriving town, and carries on extensive manufactures of hardware and firearms, which, however, are of very inferior quality. Owing to the salubrity of its climate, it is a favorite residence of invalided military men and their families. Pop. (1872) 59,698. The district has an area of 3918 square miles, with a pop. of 1,812,934. M. is on the line of the East Indian Railway.

**MO'NGOLS**, the name of a numerous and widely spread branch of the human family—the second in the classification of Blumenbach, and corresponding in almost every respect with the branch designated as Turanian by more recent ethnologists. See **TURANIANS**. Under the designation of M. are included not only the Mongols Proper, but the Chinese and Indo-Chinese, Tibetans, Tartars of all kinds, Burmese, Siamese, Japanese, Esquimaux, Samoeds, Finns, Lapps, Turks, and even Magyars. Collectively, they are the great nomadic people of the earth, as distinguished from the Aryans, Semites, and Hamites; and are the same who, in remote antiquity, founded what is called the "Median Empire" in Lower Chaldaea, an empire, according to Rawlinson, that flourished and fell between about 2453 and 2234 B.C.; that is, before Nineveh became known as a great city. Thus early did some of these nomadic tribes, forsaking their original pastoral habits, assume the character of a nation. Another great offshoot from this stock founded an empire in China, the earliest date of which it is impossible to trace, but which certainly had reached a state of high civilisation at least 2000 years B.C. In early Greek history, they figure as Scythians, and in late Roman, as Huns, carrying terror and desolation over the civilised world. In the middle ages, they appear as Mongols, Tartars, and Turks. In the beginning of the 13th c., Genghis-Khan (q. v.), originally the chief of a small Mongol horde, conquered almost the whole of central and eastern Asia. His sons and grandsons were equally successful, and in 1240–1241, the Mongol empire extended from the sea-board of China to the frontiers of Germany and Poland, including Russia and Hungary, and the whole of Asia, with the exception of Asia Minor, Arabia, India, and the Indo-Chinese states, and northern Siberia. This vast empire soon broke up into a number of independent kingdoms, from one of which, Turkestan, arose another tide of Mongol invasion under the guidance of Timur or Tamerlane, who, in the latter part of the 14th c., reduced Turkestan, Persia, Hindustan, Asia Minor, and Georgia, under his sway, and broke, for a time, the Turkish power. On the death of his son Shah Rokh, the Mongol empire was subdivided, and finally absorbed by the Persians and Usbeks, but an offshoot of Timur's family founded, in the 16th c., the great Mogul empire of Delhi. After the decline of Timur's empire, the Turkish branch maintained the glory of the race, and spread terror to the very heart of Western Europe. In the 9th c., the Magyars, a tribe of Ugrians, also of Mongol extraction, under their leader Arpad, established themselves in Hungary, where, in process of time, they became converted to Christianity, and founded a kingdom famous in European history. See **TURKS** and **HUNGARY**.

The physical characteristics of the M. in their primitive state are thus described by Dr Latham in his "Descriptive Ethnology": "The face of the Mongolian is broad and flat. This is because the cheek-bones stand out laterally, and the nasal bones are depressed. The cheek-bones stand out *laterally*. They are not merely projecting, for this they might be without giving much breadth to the face, inasmuch as they might stand forward. . . . The distance between the eyes is great, the eyes themselves being oblique, and their caruncule being concealed. The eyebrows form a low and imperfect arch, black and scanty. The iris is dark, the cornea yellow. The complexion is tawny, the stature low. The ears are large, stand-

ing out from the head; the lips thick and fleshy rather than thin, the teeth somewhat oblique in their insertion, the forehead low and flat, and the hair lank and thin." Of course, such a description as this cannot be understood as applying to the more civilised nations of Mongol origin, such as the Turks and Magyars, especially the latter, who, in physical appearance, differ but little, if at all, from other European nations.

In religion, the M. are, for the most part, Buddhists. There are among them, however, according to the different countries in which they reside, various other religions, as Confucianism, Taoism, fire-worship, paganism of different kinds, Mohammedanism, and Christianity. The Mongol languages, which are very numerous, are described by Dr Latham as being "aptotic and agglutinate, rarely with true amalgamate inflection." In 1859, according to an estimate formed by Professor Dieterici, the M. of all kinds amounted in number to as many as 528,000,000, or about half of the human race.

**MONIMIA'CEÆ**, a natural order of exogenous plants, consisting of trees and shrubs, with opposite leaves destitute of stipules; the bark and leaves having an aromatic fragrance. The flowers are unisexual. The perianth is somewhat globose, divided at the border sometimes into more rows than one. The stamens are numerous, and arise from and cover the whole interior of the tube of the perianth. There are several ovaries, each with one ovule. The fruit consists of several achænia, enclosed within the enlarged calyx. There are about 40 known species, natives chiefly of South America. A few are found in New Zealand and Australia. The fruit of the **BOLDU** (*Boldoa fragrans*), a shrub or small tree, a native of Chili, is eaten. It is a little drupe, about the size of a currant, extremely fragrant when dried.

**MONITEUR**, Le, a celebrated French journal, started by the publisher, Charles Joseph Panckoucke, 5th May 1789, under the title of the "Gazette Nationale, ou le Moniteur Universel." After the crisis of the 10th August 1792, its importance as a daily register of the events which occurred during the dark days of the Revolution, immensely increased. Whoever wishes to obtain a complete view of the phenomena of the Reign of Terror, should consult Thuan-Grandville's "Gazette Nationale, ou le Moniteur Universel, commence le 5th Mai 1789, précédé d'une Introduction historique contenant un Abrégé des anciens Etats-généraux, des Assemblées des Notables, et des principaux Evénement qui ont amené la Révolution" (1796). In 1800 it altered its form so far as to divide itself into two halves, of which the first contained the "Actes du Gouvernement." This change imparted to the journal something of an official character. After January 1, 1811, it dropped the title of "Gazette Nationale," retaining only that of "Moniteur Universel." After the Restoration it became the government organ, which it continued to be until 1869, when its official connection was discontinued.

**MONITOR**, a name given to many species of saurian reptiles, nearly allied to the true lizards, from which they differ in having no teeth on the palate. Among them are some of large size, the largest of existing saurians except those of the crocodile tribe. The tail of the greater number is laterally compressed, the better to adapt them to aquatic habits. They receive the name M. from a notion that they give warning by a hissing sound of the approach of a crocodile or alligator. For the same reason, some of the American species receive the French name *Sauvegarde*. Those of the Old World form the family *Monitoriæ*, and those of America the family *Tritonæ* of some naturalists. There are several genera of both.—The M. or **VARAN** or **THE NIL** (*M. Niloticus*) is of a rather slender form, and has a long tail. It is olive gray, mottled with black. It attains a length of five or six feet. Crocodiles' eggs form part of its food. The **TIGUEXIN** (*Telus Teguezin*) of Brazil and Gulara is of similar size. It preys on aquatic animals. Other large species are plentiful in almost all tropical countries. They are powerful animals, have strong teeth, and defend themselves vigorously if attacked. Some comparatively small species, feeding chiefly on insects, are found in dry situations. Some of the large South American species are used for food.

**MONITOR**. See **TURRET-SHIP**.

**MONITORIAL SYSTEM**, or Mutual Instruction. It first occurred to Dr Bell (q. v.), when superintendent of the Orphan Hospital, Madras, in 1795, to make use of

Monk  
Monkey

198

the more advanced boys in the school to instruct the younger pupils. These youthful teachers were called Monitors. The method was eagerly adopted by Joseph Lancaster (q. v.) who, in the first years of this century, did so much for the extension of popular education; and from him and the originator, the system was called indifferently the Madras and the Lancastrian, as well as the Monitorial or Mutual System. The monitorial system is not, as is commonly supposed, a method of teaching; it is simply a method of organising schools, and of providing the necessary teaching power. At a time when the whole question of primary education was in its infancy, the state refusing to promote it on the ground that it was dangerous to society, and the public little disposed to contribute towards its extension, it was of great importance that a system should be adopted which should recommend itself as at once effectual and economical. It was manifest that even with the most skilful arrangement of classes, a single teacher could not undertake the tuition of more than 80 or 90 pupils; while, by the judicious employment of the cleverer boys under the general direction of the master, the school might be made almost self-working, and 300 to 400 children taught where there was only one adult superintendent. The novelty and economy of this plan, and we may add also, its temporary success, gained for it a large and enthusiastic support both in Britain and in Germany. But the importance of the system as an educational agency was universally over-rated, for although it is to be admitted that, under an able and enthusiastic master, boys may be inspired to teach well all technical and rote subjects, (as, for example, in the Latin and Greek classes under Dr Pillans of the Edinburgh High School), yet it is manifest that children so instructed are not in any sense of the word educated. Their monitor necessarily lacks the maturity of mind which is indispensable to the instructor, whose business it is to arouse in the child those mental operations which have taken place within himself, and so lead him to an intelligent and rational grasp of intellectual and moral and physical truths. No amount of private instruction from the master, no enthusiasm could ever enable a boy to do this, and consequently the system broke down, after having done its work by being the engine whereby a large interest was stirred up in the education of the masses, and whereby the requisites of a primary teacher were brought into view. The reaction against the system, however, was not so violent in Great Britain or in Holland and France, as in Germany. In England, the monitorial system was modified in such a way as to secure for the master the aid of the more clever boys in teaching rote subjects, in revising lessons, keeping registers, and supervising the work of those classes not directly under the master's tuition. In this way were afforded the means of training for the teaching profession boys who seemed fitted by natural endowment for the work. Hence the prevalent employment in this country of paid monitors and pupil-teachers (male and female), who are regularly apprenticed to school managers and teachers, and go forward to be trained in the normal schools now so numerous.

**MONK, George, Duke of Albemarle**, was the son of Sir Thomas Monk of Potlridge, in Devonshire, and was born at his father's residence, 6th December 1603. He spent some of his earlier years in the service of Holland, returned to England when about the age of 30, and served in the king's army against the Scots in 1633, attaining the rank of lieutenant-colonel. On the breaking out of the Irish rebellion, in 1642, he was appointed colonel of Lord Leicester's troops, sent to crush it. When the civil war began, these troops were recalled, and M. was imprisoned on account of being supposed to favor the cause of the Parliament, but was soon after released. In 1644, he was defeated and taken prisoner by Fairfax, and imprisoned in the Tower, from which he was liberated, after two years, on his swearing the Covenant. Clarendon hints that he sold himself for money. He was now intrusted with the command in the north of Ireland. Cromwell had a high opinion of his military talents, and made him his lieutenant-general and commandant of artillery; and the service which he rendered at the battle of Dúnbar was so great, that he was intrusted with the chief command in Scotland. In 1653, he was joined with Admiral Blake in an expedition against the Dutch, and with his division of the fleet, consisting of 100 ships, defeated Admiral Van Tromp off Nieuwpoort, and fought another battle with him off Katwijk, in which the victory was doubtful, but Van Tromp lost his life. In April 1654, Cromwell sent him to Scotland as governor, in which difficult office he conducted himself with vigor, moderation, and equity. Even the high-

lands, those immemorial "sanctuaries of plunder," as Guizot calls them, were reduced to order. His principal residence was Dulkeith, where he spent his leisure hours in gardening, of which he was very fond. When, after Cromwell's death, he saw everything in confusion, and felt his own position perilous, he crossed the English border, 1st January 1660, with 6000 men, united his troops with those which Fairfax had collected for Charles II., and entered London unopposed, although as yet he kept his views profoundly secret. His powers of dissimulation and reticence were immense. Everybody felt that the decision lay with "Old George," as his soldiers used to call him; every party courted him; he was even offered the protectorate; but while he offended nobody, he declined to connect himself with any of the sectaries, and waited patiently the course of events. His own wish (though it did not proceed from any very high-minded motive) was to bring back the Stuarts; and before long, he saw that the nation in general was thoroughly with him. On the 21st of February he called together the remaining members of the parliament which had been violently driven out twelve years before, and Charles II. was presently recalled. M. was now made Duke of Albemarle, loaded with honors, and intrusted with the highest offices in the state. But he soon retired from political affairs. In 1665, when the plague ravaged London, and every one fled that could, "Old George," as governor of the City, bravely stuck to his post, and did what he could to allay the terror and confusion. Next year, he was employed as second in command of the fleet sent under the Duke of York against the Dutch; and was defeated by Von Ruyter in a sea-fight off Dunkirk, but soon after gained a bloody victory over him off North Foreland. He died 3d January 1670. Guizot describes him as a "man capable of great things, though he had no greatness of soul." See Guizot's "Monk," Chute de la République," Skinner's "Life of Monk," Hallam's "Constitutional History," and Macaulay's "History of England."

**MONKEY** (*Simia*), a Linnean genus of *Mammalia*, of the Linnean order *Primates*, and of Cuvier's order *Quadrumania*, now constituting the family *Simiadae*. The word *M.* was formerly of almost, if not altogether, the same signification with *Ape*; but the name *ape* is now more generally applied to those *Simiadae* which have no tail, and no cheek-pouches; the name *M.* to those which have cheek-pouches and long tails, prehensile or not prehensile; whilst the name *Baboon* (q. v.) is applied to creatures considerably different from both. The smaller tailless *Simiadae* are, however, still not unfrequently spoken of as monkeys, and the term is also sometimes used to comprehend all the *Simiadae*.

Of all animals, the *Simiadae* exhibit the greatest resemblance to man, both in their general form and their anatomical structure. This is particularly the case with some of the larger apes. In none of them, however, is there a natural adaptation for the erect position so characteristic of man, which is assumed rarely, and in general only by captive individuals, as the result of training and constraint, all of the *M.* tribe preferring to walk on four feet rather than on two, but all of them being adapted for living chiefly among the branches of trees, or—according to the habits of a comparatively small number of species—among bushy cliffs, where they make use of the four extremities for prehension, as hands. Most of them leap from branch to branch with wonderful agility, and some also swing themselves from a branch by their long prehensile tail, till they can seize hold of another branch. The thumb, in all the four extremities, is opposable to the fingers, which are long and flexible; but there are some monkeys which want the thumb of the fore-limbs, or have it merely rudimentary, whilst the hind-limbs are always furnished with perfect hands. In attempting to walk erect, an ape necessarily treads, not on the soles, but on the sides of its feet, which are turned inwards, and the muscles of the legs do not enable it to maintain an erect position long or easily. This difficulty is increased by the way in which the head is affixed to the vertebral column, the *occipital foramen* being further back than in man, so that the weight of the head is thrown forward.—The face of a *M.* exhibits a grotesque resemblance to that of man: but the lower forehead, the less perfect nose, and the more projecting jaws, give it a brutal character. The dentition of monkeys is so similar to that of man, that the dental formula for very many is the same, although many others have an additional molar on each side of each jaw; but in many, the great size of the canine teeth is a marked brutal characteristic.—The digestive organs are generally very similar to those of man,

but in some of the *Simiadae*, more exclusively confined to vegetable food, there is a remarkable difference in a peculiar and very complicated structure of the stomach. —The food of monkeys consists chiefly of fruits, corn, and other vegetable substances; but most of them also catch and eat insects, and even birds, of the eggs of which they are also very fond. In captivity, they learn to eat and drink almost everything that is used by man, and shew a great fondness for sweet things, and for alcoholic liquors. —The skin of monkeys is generally covered in all parts with hair, but some have the face partially naked, and many have naked callosities on the buttocks. —Many have capacious cheek-pouches, in which they stow away food which they cannot consume with sufficient expedition. They are mostly gregarious, although to this there are some exceptions. Many of the species display strong attachments to their mates and to their offspring. One or two young are generally produced at a birth. They display a remarkable propensity and talent for imitation; and this, with their extreme agility, their curious prying disposition, and their love of trick or mischief, makes them very amusing, whether in a wild or a captive state. Many of the stories told of monkeys manifest also a high degree of intelligence, although it may be doubted if the intelligence of any of the species exceeds that of the dog or the elephant. Notwithstanding their resemblance to the human form, their imitative propensity, and their intelligence, none of the monkeys shew the smallest capacity for imitating the human voice; and their "chattering" is very unlike articulate speech.

The species of this family are very numerous, but are all confined to the warm parts of the world; Australia, however, and the South Sea Islands being destitute of them. They are divided into a number of genera, some of which belong exclusively to particular portions of the world. But in this respect, the most remarkable circumstance is the difference between those of the Old World and those of America, the geographical distribution corresponding with the division of the family into two principal groups—the monkeys of the Old World (*Catarrhini* of some naturalists), to which alone the name *Simiadae* is sometimes restricted, having the nostrils separated only by a narrow septum, and the tail wanting, short, or long, but never prehensile; the monkeys of the New World (*Platyrrhini*), the family *Cebidae* of some naturalists, having the nostrils widely separated, the tail always long, and often prehensile, most of them having also the four additional molar teeth already noticed, which none of the monkeys of the Old World possess; but none of them having cheek-pouches, which many of the monkeys of the Old World have. The most interesting genera and species of *M.* are noticed in separate articles.

**MONKEY POTS.** See *LEOTHTIDACEÆ*.

**MONK'S-HOOD.** See *ACONITE*.

**MONK'S RHUBARB.** See *DOCK*.

**MONMOUTH**, a parliamentary and municipal borough and market-town of England, capital of the county of the same name, stands amid beautiful scenery, at the confluence of the Monnow and the Wye, 21 miles west-south-west of Gloucester. Its church, dating from the 14th c., is surmounted by a lofty spire. Of its castle, the favorite residence of John of Gaunt, and the birthplace of Henry V., the ruins only remain. A building, said to be the study of Geoffry of Monmouth, is all that exists of the Benedictine monastery. Railways connect the town with Newport on the w. and Ross on the e. Ironworks, employing a number of workmen, are in operation. Pop. (1871) 5879. *M.* unites with Newport and Usk in sending a member to parliament.

**MONMOUTH**, a maritime county in the west of England, bounded on the s. by the estuary of the Severn, on the w. by Glamorgan, and on the e. by Gloucestershire. Area, 368,399 acres. Pop. (1871) 195,443. The chief rivers are the Usk, the Wye on the eastern border, and the Rumney on the western border—all of which flow south into the estuary of the Severn. The coast-line, 23 miles in length, is indented only at the mouth of the Usk (which is navigable for vessels of the largest size to Newport), and at the mouth of the Wye, which vessels ascend to Chepstow. The surface is elevated in the north and north-west (the Sugar-loaf is 1866 feet high), but the coast districts, comprising the Wentloog and the Caldecot Levels, are low and rich, and are protected from the wash of the sea by sea-walls and earthworks. In

the fertile valleys of the Usk and Wye, wheat is the principal crop; but in the less favored localities, barley and oats chiefly are grown. Coal, limestone, and ironstone abound in the mineral district of M., in the north-west of the county. This district, comprising 89,000 acres, abounds in collieries and ironworks, and is a perfect network of railways. M. was a Welsh county until the reign of Henry VIII., but the ancient language is now heard only in a few western districts. The scenery of this county is unusually beautiful; and in no part of England are to be found so many remains of feudal castles as in the eastern districts of this county. The chief remains are Raglan, Caldecot, and Chepstow castles; and Llanthony and Tintern abbays (q. v.). Roman antiquities are numerous. The county sends two members to parliament.

**MONMOUTH**, James, Duke of, natural son of Charles II., was born at Rotterdam in 1649. His mother, Lucy Walters, according to Evelyn, a "browne, beautiful, bolde, but insipid creature," came to England with her son in 1656, during the Commonwealth. She is said to have been treated as though she had been the king's wife, and was committed to the Tower; but was soon allowed to retire to France, where she died. Charles sought out the boy, and committed him to the care of Lord Crofts, who gave him his own name. On the Restoration, M., then "Mr James Crofts," came to England with the queen-dowager, and was handsomely lodged at Hampton Court and Whitehall. These honors were, in after-years, referred to by his followers as justifying their belief that he was indeed the king's legitimate son. A wealthy heiress, Anne, daughter of the Earl of Buccleuch, was selected for his wife; and before he had completed his 16th year, he was married to her, and was created Duke of Monmouth. About the year 1670, Shaftesbury put M. forward as the head of the popular party, and rival of the Duke of York (afterwards James II.). At the period of the Titus Oates' plot (1678), rumors that the "Protestant Duke" was indeed the king's legitimate son spread far and wide. The Duke of York was compelled to quit the kingdom; and parliament brought forward a bill for excluding him from the succession, when Charles suddenly dissolved it. A document was at the time issued by the king, solemnly declaring that he had never been married to Lucy Walters. M. was sent into Scotland, in 1679, to quell the rebellion. He defeated the Covenanters at Bothwell Bridge; but his humanity to the fleeing and wounded was so conspicuous, and his recommendations to pardon the prisoners were so urgent, as to bring upon him the violent censures of the king and Lauderdale. He thus became the idol of the English Nonconformists. The return of the Duke of York, and the exile of M., soon followed. In Holland, he allied himself to the leaders of the Nonconformist party, exiled like himself; and when he was allowed to return to London, he was received with such demonstrations of joy, that M. felt that he was the people's choice. In 1680, he made a semi-royal progress through the west of England, with the design, probably, of courting the Nonconformists, who were more numerous there than in any other part of the country, except London and Essex. In 1682, he traversed some of the northern counties.

The king and his brother were alarmed; and M. was arrested at Stafford, and bound over to keep the peace. He meekly confessed his participation in the Rye-House plot, accusing himself and others of a design to seize the king's person, and subvert his government. The king pardoned him, on his solemn promise to be a loyal subject to the Duke of York, in case the latter should survive the king. In 1684, M. fled to Antwerp, and remained abroad until the death of the king, when he resolved to embark for England. He landed (June 11, 1685) at Lyme-Regis, and issued a manifesto declaring James to be a murderer and usurper, charging him with introducing popery and arbitrary power, and asserting his own legitimacy and right by blood to be king of England. He was received with great acclamations at Taunton, where he was proclaimed as James II. At Frome, he heard the news of the defeat of Argyle, who, at the head of the Scottish exiles, had attempted to raise an insurrection in Scotland. Money and men were now abundant; but arms were wanting, and thousands went home for want of them. On the 5th July, he was persuaded, with only 2500 foot and 600 horse, to attack the king's forces, which, under the command of the Earl of Faversham, were encamped at Sedgemoor, near Bridgewater. M.'s troops were unable to cross a running stream or wide ditch which protected the camp, and were mowed down by the king's artillery. Their ammunition soon failed; and M. having set a cowardly example of flight, his troops were slaughtered

like sheep. About 300 of M.'s followers fell in the battle; but 1000 were massacred in the pursuit. M. was found concealed in a ditch, and was brought to London. He made the most humiliating submissions, and obtained a personal interview with James. "He clung," says Macaulay, "in agonies of supplications round the knees of the stern uncle he had wronged, and tasted a bitterness worse than that of death, the bitterness of knowing that he had humbled himself in vain." Even his prayer for "one day more," that he might "go out of the world as a Christian ought," was brutally refused. On the 15th June, he was brought to the scaffold, and beheaded on Tower Hill; the executioner performing his office so unskilfully that five blows were struck before the head was severed. The "Bloody Assize" afterwards commenced under Judge Jeffreys, when M.'s adherents paid a fearful penalty for their participation in his rash and ill-advised rebellion.

**MO'NOCHORD**, an apparatus constructed to exhibit the mathematical proportions of musical intervals. It consists of a flat board of four or eight feet long, better 16 feet, where space can be spared. The breadth of the board is according to the number of the strings, which are from two to six. The board is covered with fine white paper. A straight line is drawn from end to end below each string, and each line is accurately divided into the different proportions into which the full length of the string, as a fundamental sound, harmonically divides itself. See **HARMONIOS**. The string is fixed at one end, and rests on a bridge; while at the other end, where it also rests on a bridge, it is stretched by a tuning-peg, or by a weight. The sounds from the strings are produced by a violin-bow. The monochord is chiefly used in illustrating acoustical experiments in the proportion of intervals and temperament.

**MONOCOTYLEDONOUS PLANTS**, plants in which the embryo has one and only one Cotyledon (q. v.). The cotyledon in these plants varies extremely in form, and is often comparatively of great size, but has always a slit, from which, as germination takes place, the gemmule sprouts. The gemmule in elongating assumes an acuminate shape. Monocotyledonous plants are all Endogenous (q. v.); except the Dictyogens (q. v.), in which the endogenous structure is not perfectly exhibited. They are also *endorhizal* (Gr. *endon*, within, *rhiza*, a root); that is, the radicle is covered with a cellular sheath, and gives rise to fibrils similar to itself in structure. The leaves are generally sheathing at the base, and there embrace the stem; they also generally have simple parallel nerves connected by cross veins, the leaves of dictyogens alone being reticulated. The number of the parts of the flower is generally three, or a multiple of three. The floral envelopes, often splendid, as in lilies, tulips, &c.—are generally united as a Perianth (q. v.), instead of forming a distinct calyx and corolla. The principal natural orders of monocotyledonous plants are Grasses, *Cyperaceæ*, Palms, Orchids, *Scitamineæ*, *Musaceæ*, *Liliaceæ*, and *Iridaceæ*. The general appearance of monocotyledonous plants distinguishes them almost as perfectly as any structural characters.

Of the fossil remains of the vegetable kingdom, the smallest portion consists of monocotyledonous plants, both acotyledonous and dicotyledonous plants being much more abundant.

**MO'NODON**. See **NARWHAL**.

**MONŒCIOUS** (Gr. *monos*, one, and *oikion*, a habitation), the term used in botany to describe those plants which have the male and female parts of fructification (*stamens* and *piatils*) in different flowers, but upon the same plant. The flowers of such plants are also said to be *monœcious*. Monœcious plants form one of the classes of the Linnæan artificial system, but many occasional instances of monœcious species are to be found in genera belonging to other classes. Monœcious plants often have the flowers in catkins, sometimes the male flowers only; and often in spikes, the male flowers sometimes occupying the upper, and sometimes the under part of the same spike with the female flowers, and sometimes distinct spikes upon the same plant. Common examples of monœcious plants are the hop, box, birch, beech, alder, oak, and hazel.

**MONOGRAM** (Gr. *monos*, alone, and *gramma*, letter), a character composed of two or more letters of the alphabet, often interlaced with other lines, and used as a cipher or abbreviation of a name. A perfect monogram is one in which all the letters

of the word are to be traced. The use of monograms began at a very early date. They are found on Greek coins, medals and seals, and are particularly numerous on the coins of Macedonia and Sicily. Both on coins and in MSS., it was the practice to represent the names of states and cities by monograms, of which above 500 are known, but some have not been deciphered. Monograms occur on the family coins of Rome, but not on the coins of the earlier Roman emperors. Constantine placed on his coins one of the earliest of Christian monograms, which is to be traced in the recesses of the catacombs, composed of the first and second letters of  $\chi\rho\iota\varsigma$  (Christus), a monogram which also appeared on the Labarum (q. v.), and was continued on the coins of the succeeding emperors of the East down to Alexander Comnenus and Theodorus Lascaris. We often find it combined with the first and last letters of the Greek alphabet (Rev. i. 8). Another well known monogram is that of the name of Jesus, IHS, from the first three letters of  $\iota\eta\varsigma\omicron\upsilon\varsigma$ .

Popes, emperors, and kings of France during the middle ages were in the practice of using a monogram instead of signing their names. Almost all the coins of the French kings of the Carlovingian race bear their respective monograms, as also do those of Alfred and some of the other Saxon kings of England.

Painters and engravers in Germany and Italy have used monograms to a large extent as a means of distinguishing their works. In these, the initial letters of their names were often interwoven with figures of a symbolical character, so as to form a rebus, on the artist's name. The first typographers distinguished their publications by wood-cut vignettes, whose invention is ascribed to the elder Aldus; but besides these, each made use of a monogram or cipher, a series of which, well known to the bibliographer, fixes the identity of the ancient editions, German, Italian, and English, from the invention of printing down to the middle or end of the 16th century. For a detailed account of the monograms of early printers and others, see Brulliot, "Dictionnaire des Monogrammes" (Munich, 1832-1834); Horne's "Introduction to Bibliography," vol. ii.; and Herbert's and Ames's "Typographical Antiquities."

**MONOGRAPH**, a work in which a particular subject in any science is treated by itself, and forms the whole subject of the work. Monographs are entirely of recent date, and have contributed much to the progress of science. In botany especially, monographs of orders and genera are very numerous; and some of them are among the most splendid and sumptuous of scientific works.

**MONOLITH**, a monument, column, obelisk, statue, or other structure formed of a single stone. In India, there are examples of monolithic temples, the whole being cut out of the solid rock.

**MONOMANIA** has loosely been made to represent every form of partial insanity; but has been more rigidly defined as that mental condition in which a single faculty, or class of faculties or associations, become diseased, the mind generally remaining healthy. Slight and solitary aberrations, such as where a savage antipathy to cats coexists with a love for human kind; where there appears to be an uncontrollable tendency to steal, to squander, to drink, to destroy, are of common occurrence, and are supposed to be compatible with the exercise of intelligence, and with the discharge of many of the ordinary duties of life. By a more strict limitation, the term has been confined to such affections as involve the emotions and propensities alone. It is, however, held that, notwithstanding its apparent integrity, the whole mind is involved or influenced by the presence of such morbid conditions, at least while they are predominant. It is undoubtedly difficult to point out in what manner the belief, e. g., that a particular organ has been transmutated into glass, can interfere with or render the memory, or the power of instituting comparisons, defective and untrustworthy; yet it is legitimate to receive with caution every manifestation of powers so constituted that they fail to detect the incongruities and absurdities with which they are associated; or, having detected the real character of these errors, are unable or unwilling to cast them out, or to disregard them. There is much countenance given to this theory by facts which indicate that even trivial forms of mental obliquity are connected with an unsound organisation; and that particular and rarely recognised monomanias are invariably associated with the same structural alteration. The unhealthy elevation of the sentiment of cautiousness, for example, especially where it amounts to fear of death, panic, or panphobia, is a symptom of disease of the heart

**Monongahela**

and large blood-vessels; while the monomania of ambition, or optimism, as it has been styled, is the concomitant of the general paralysis of the insane. It will be obvious, from the definitions previously introduced, that the species or varieties of monomania must correspond to the faculties or phases of the human mind, and to their combinations. Several great divisions, however, have been signalled, both on account of their frequency and of their influence upon the individual and upon society. 1. Monomania of Suspicion, comprehending doubts in the fidelity and honesty of friends and those around, belief in plots and conspiracies, the dread of poison; and where, as is often the case, it is conjoined with cunning, the propensity to conceal, mystify, and deceive. This malady has frequently been observed in intimate connection with cancer and malignant growths. 2. Monomania of Superstition and Unseen Agencies, where credulity, mingled with religious awe, peoples the external world with spectres, omens, mysteries, magnetism; and the imagination with horrors or ecstatic reveries. Insensibility to pain, or indifference to external injuries, has been observed as a characteristic of individuals affected with this disease. 3. Monomania of Vanity, or Euphoria, where display and ostentation are indulged, without reference to the position and means of the patient. 4. Monomania of Fear. 5. Monomania of Pride and Ambition. 6. Kleptomania (q. v.). 7. Dipsomania (q. v.). If it can be proved that such morbid tendencies, as have been here mentioned, and others still less prominent, are merely salient points of a great breadth and depth of mental disease, the plea of insanity may justifiably be employed more frequently in the consideration of criminal acts.—Esquirol, "La Monomanie;" Bayle, "Maladies du Cerveau;" Stephens's "Criminal Law of England," p. 92.

**MONONGAHE'LA**, a river which rises in the Alleghany Mountains in Virginia, United States of America, and flowing north into Pennsylvania, unites with the Alleghany at Pittsburg to form the Ohio. Its whole length is 300 miles. It is navigable for steam-boats to Brownsville, 60 miles, with dams and locks for low water. Vast seams of coal open in its high banks, from which flat boats are loaded, and floated down with the current through the Ohio and Mississippi.

**MONOPT'RAL**, a temple formed of an open circle of columns carrying a roof, and without a cell.

**MONO'PHYSITES**, the name given to a widely ramified sect of Christians who hold that Christ has only *one* nature (Gr. *monos*, one; *physis*, nature), a human nature become divine. Monophysite views were first decidedly put forward in the controversy against Nestorius. Cyril having expressed the opinion that the flesh of the Logos was essential to his personality, the archimandrite Eutyches (q. v.) went on to assert a deification or apotheosis of the flesh of Christ, and obtained the consent of a synod at Ephesus, in 449, commonly called the "Synod of Robbers," to this doctrine; but he and his adherents (at first called after him **EUTYCHIAN**) were condemned as heretics by the Council of Chalcedon in 451. It was after this council that the name *Monophysites* began to be used. The decision of the council, however—viz., that in Christ *two* natures, neither interfused, changed, nor divided, were united in *one* person, and constituted *one* hypostasis—was not calculated to allay, but rather to increase discord. Accordingly, the strife grew hotter. The Asiatic and Egyptian clergy, strongly opposed to Nestorianism, were generally inclined to Monophysite views, and received countenance from the Emperor Basiliscus. After long, and often bloody contests between the supporters of the opposite opinions, the M. formally separated from the orthodox church. This separation took place in the first half of the 6th c., when the imperial protection hitherto bestowed upon them was lost by the alliance of the emperors Justin and Justinian with the Latin Church. Besides, they had not maintained unity among themselves. As early as 452, when the Emperor Zeno published his famous "Henoticon," or formula of concord, it was accepted by several of the more moderate Monophysites. This roused the indignation of the extremest sectaries; they renounced fellowship with their laxer brethren, and formed a sect of their own. They were called *Akephaloi*, and formed the *ultras* among the Monophysites. Controversies arose also in 519 on the question, whether or not the body of Christ was corruptible. The Severians—adherents of Severus, a deposed bishop of Antioch—affirmed that it was; the Julianists, or Gajanites, followers of Bishop Julianus or Gajanus, denied it. The former were consequently called (Gr.) *Phthar*

*tolatristæ*, (Lat.) *Corrupticolæ* (Worshippers of the corrupt); the latter, *Aphthartodocetæ* (Believers or Teachers of Incorruption), and sometimes—as an incorruptible body could only be apparent, and not real—*Phantasiasts*. The *Aphthartodocetæ* split again on this other point—whether or not Christ's body was created; the *Aktistotol* (Gr. *ktizo*, to create) asserting that it was not created, and the *Ktistolatristæ*, that it was. The Severians, called also, after one of their bishops, *Theodosians*, finally got the upper hand, and excommunicated their opponents, including another sect, the *Aguoetæ*, who denied that Christ as a man was omniscient. About 560, the Monophysite Askanages, and after him the Christian philosopher Philoponus, ventured to speak of the Three Persons in the Godhead as Three Gods. This, however, was reckoned heretical even by the M. themselves, and was the occasion of a large recession to the bosom of the Catholic Church. Monophysite communities continued strongest in Egypt, Syria, and Mesopotamia, where they maintained a regular ecclesiastical order under their own patriarchs of Alexandria and Antioch; and after the Syrian, Jakob Baradaenus (Al-Baradai, died about 578), had drawn up for them an ecclesiastical constitution, they formed the independent churches of the *Jacobites* (q. v.) and *Armenians*. See ARMENIAN CHURCH. The Coptic and Abyssinian churches are also Monophysite in doctrine.

**MONO'POLI**, a town of Southern Italy in the province of Bari, situated on the Adriatic shore, in a pleasant and healthy plain, 28 miles east-south-east of Bari. Pop. about 20,000. It is supposed to be of Grecian origin, the name in Greek signifying the *solitary city*. It is surrounded by walls, and has a fortress constructed in 1662 by Charles V. The neighboring territory yields an immense quantity of olive oil.

**MONO'POLY**, from the Greek, signifies sole selling or individual selling, and has always been used to express a limitation to one or more persons of the right or power to conduct business as a trader. It is generally used in a bad sense to express something injurious, but economic science has lately very much narrowed the field over which its injurious character is supposed to extend. In the first place, it must be created by force; if it come in the natural course of trade, it is generally beneficial. Thus, to a village where three or four traders have conducted a small lazy business, drawing large profits, there comes a capitalist, who sets up a large concern on the ready-money system, and, by selling good articles at a low rate, absorbs all the business. He is of course abused as a monopolist by the ineffective persons he has superseded; but his presence is a blessing to the community generally. If, however, he had gone to the village, not to compete with others, but with a royal patent in his pocket securing to him the exclusive trade of the village, as he could sell at his own price, and make a fortune without trouble, he would of course be, like the old royal monopolists, a calamity to the people.

A careful distinction must be preserved between monopoly and property—that is to say, an exclusive right to *trade* must be separated from an exclusive right to *possess*—for, while the law of property exists, possession will always be exclusive. If, then, a trade can only be conducted with large capital, it must fall to those who either singly, or by co-operation, can command that capital; and the answer to all complaints on the part of others is, that since capitalists can best serve the public, it is best for the public that capitalists should be allowed to do so. The old corn-laws and landed property conjoined to produce one of the best illustrations of the distinction. The power of producing grain within Britain has always been of necessity limited to those who have, either as owners or tenants, the command of the land. Forfeit all the land in the country to-morrow, and proclaim the production of grain to be free, the result would only be a change of ownership; for those who by their good-luck, or more probably by their power, got hold of rich old wheat-lands, would produce their grain much cheaper than those who got the poor lands, and, selling the produce at the same price, would pocket the difference, which would, in fact, just be rent gained by them as the new landlords. But when dealers offered the people grain from abroad, and the corn-laws rendered it impossible to sell that grain in this country, then there was a monopoly in favor of the home-producer, having the effect of artificially raising prices, and otherwise disturbing trade.

A deal of legislation was wasted by our ancestors in enactments to prohibit peo-

ple from creating monopolies by that fair competition which is now considered the true healthy development of trade. Some account of them and of their repeal will be found in the article **ENGROSSING**. When British trade was increasing in the 16th c., it found some old powers alleged to be inherent in the royal prerogative for conferring exclusive trading rights, which led to much oppression and loss. In Queen Elizabeth's parliament of 1597, a complaint was made that, for the benefit of favored courtiers, oppressive monopolies had been granted, not only for the sale of foreign luxuries, but for salt, leather, coal, and other articles of ordinary consumption. Queen Elizabeth said she "hoped her dutiful and loving subjects would not take away her prerogative, which is the choicest flower in the garden, and the principal and head-pearl in her crown and diadem." Parliament returned to the charge, however, in 1601, when, on the reading over of the list of monopolies, a theatrical scene occurred by a member calling out: "Is not bread among the number?" and on this producing a sensation, continuing: "Nay, if no remedy is found, bread will be there before the next parliament." In 1621, parliament took proceedings against Sir Giles Mompesson, charged with an oppressive use of his patents monopoly. Four years afterwards, an act was passed limiting this power in the crown. It leaves only the right to grant a limited monopoly in the manufacture of his invention to any inventor, and this is the origin of the present patent law. See **PATENT**.

**MONO'STOMA**, a genus of Trematoid worms, so called from having only a single sucker, which is situated anteriorly, and surrounds the mouth. It belongs to the *Trematoda Digenea* (of Van Beneden), all of which present the phenomena of alternation of generations, the earlier or larval forms occurring chiefly in molluscs, while the perfect worms are found, for the most part, in vertebrate animals. Among the species of this genus occur *M. flavum*, found in waterfowl (the larva being the *Cercaria ephemera*, which is common in *Planorbis*, &c.), *M. mutabile*, found in various birds, and *M. lentis*. The last-named species derives its specific name from its having been found by Von Nordmann in a lens extracted in a case of cataract. Cobbold and other distinguished helminthologists are inclined to believe that this is not an independent species, but that it is identical with the *Distoma ophthalmiobium* of Diesing.

**MONOTHEISM**, the term usually employed to denote a belief in the numerical unity (*unus numero*) of the Godhead, or belief in and worship of one God. It is thus the opposite of *Polytheism* (q. v.). See **GOD**. The "doctrine of the Trinity" is thought by some to be incompatible with the monotheism taught by Jesus Christ, and is therefore rejected as no part of his teaching. See **UNITARIANS**. Mohammedans and Jews hold the doctrine of the "unity of God," even more rigorously in some respects than modern Christians, at least they reject with vehemence the least approach to a Trinitarian conception of the Deity. The majority of mankind are polytheists.

**MONOTHELISM** (Gr. *monos*, single, and *thelein*, to will), a modification of Eutychianism, which was introduced after the condemnation of that doctrine by the Council of Chalcedon. It consisted in maintaining that, although Christ had two natures, yet, these natures possessed or acted by but a single will, the human will being merged in the divine, or absorbed by it. The author, or at least the most active propagandist of this doctrine, was Sergius, Patriarch of Constantinople, who obtained for it the support of the Emperor Heraclius; and its progress was materially forwarded by the silence which, at the instance of Sergius, and under his representations, the pope, Honorius (q. v.), was induced to maintain regarding the question. The doctrine was formally condemned in the sixth general council held at Constantinople, in the year 680, with which condemnation it is commonly said that the early controversies on the incarnation were ended. See **EUTYCHES** and **MONOPHYSITES**.

**MONOTREMATA** (Gr. *monos*, single *trēma*, an opening), the lowest order of mammalia, in many of their characteristic points indicate an approximation to birds. The skull is smooth; the brain-case very small as compared to the face; the snout much prolonged, and the jaws unprovided with soft movable lips, and not furnished with teeth. (In the ornithorhynchus, there are two horny plates in each half-jaw, which act as teeth, while in the echidna even these substitutes for teeth are wanting.)

The cranial bones coalesce, as a bird's, at a very early period, and leave no signs of sutures. The external ear is altogether absent; while the eyes, though small, are perfectly developed.

The bones of the shoulder, forming the scapular arch, are unlike those of any other mammals, and in some respects resemble those of birds, and in other respects those of reptiles. At the top of the sternum is a T-shaped bone, formed by the union of the two clavicles, corresponding to the *furculum* in the bird's skeleton. The coracoid bones, which in other mammals are mere processes of the scapula, are here extremely large, and assist, as in birds, in strengthening the scapular arch; while the scapulae themselves are produced beyond the socket of the humerus (the glenoid cavity), so as to articulate with the sternum.

The pelvis is provided with marsupial bones, although these animals do not possess a pouch.

The feet have five toes, armed with long nails; in addition to which, the hind-feet of the males are provided with a perforated spur-like weapon, which is connected with a gland. The Australian aborigines believe the wounds made by this spur to be poisonous; but there is no scientific evidence of the fact.

The ovaries are analogous to those of birds, the right ovary being comparatively undeveloped, while the left forms a racemiform mass. The orifices of the urinary canals, the intestinal canal, and the generative canal, open, as in birds, into a common cloaca, from which circumstance the order *Monotremata* derives its name. The mammary glands, of which there is only one on each side, are not provided with nipples, but open by simple slits on each side of the abdomen.

This order includes only two or three species, all natives of Australia or Van Diemen's Land, which, however, form two families—the *Ornithorhynchidae* (see DUCK-BILL), and the *Echidnidae* (see ECHIDNA).

No fossil remains of any animals of this order have as yet been discovered.

**MONOTROPA'CEÆ**, a small natural order of exogenous plants, allied to *Ericæ* and *Pyrolacææ*; but remarkably differing from both in their habit. They are herbaceous plants with scales instead of leaves, and grow parasitically on the roots of pines and other trees, in the northern parts of the world. The only British species is *Monotropa hypopitys*, sometimes called *Yellow Bird's Nest*. The whole plant has a pleasant smell.

**MONREA'LE**, a city of the island of Sicily, province of Palermo, and 5 miles south-west of the city of that name, on the flank of a steep hill. Pop. 15,561. It has a cathedral, a palace, several conventual establishments, and possesses a healthy climate. Its chief source of wealth is its export trade in oil, corn, and fruit, almonds being one of its most important products.

**MONRO**, Alexander, an eminent anatomist, and founder of the medical school of Edinburgh, styled *primus* to distinguish him from his son and successor, was born at London, September 8, 1697. His grandfather, Sir Alexander Monro of Bearcrofts, a colonel in the army of Charles II. at the battle of Worcester in 1651, was afterwards an advocate at the Scottish bar; and his father, John Monro, for some years a surgeon in the army of King William, in Flanders, on leaving it, entered into practice in Edinburgh. Alexander studied at London under Cheselden, at Paris under Bouquet, and at Leyden under Boerhaave, and in 1719 passed as a surgeon in Edinburgh. In January 1720, he was elected by the town-council first Professor of Anatomy in the university. Of the establishment and building of the Royal Infirmary of Edinburgh, he was one of the two principal promoters, and after it was opened, he delivered clinical lectures there for the benefit of the students. In January 1756, he received the degree of M.D., and in March following was elected a Fellow of the Royal College of Physicians of Edinburgh. In 1759, he resigned the anatomical chair to his youngest son, the subject of the following notice, but continued his clinical lectures at the Infirmary. His principal works are—"Osteology, or Treatise on the Anatomy of the Bones" (Edin. 1726, 8vo); "Essay on Comparative Anatomy" (Lond. 1744, 8vo); "Observations, Anatomical and Physiological" (Edin. 1768, 8vo); and an "Account of the Success of Inoculation of Small-pox in Scotland" (Edin. 1765, 8vo). He was secretary of a Society at Edinburgh, which published six volumes of "Medical Essays and Observations," many of them contributed by himself. Two more volumes of "Essays, Physical and Literary," were

subsequently issued by the same Society, under the name of the Philosophical Society. Dr M. died July 10, 1767. He was a Fellow of the Royal Society of London, and a member of the Royal Academy of Surgery of Paris.

MONRO, Alexander, *secundus*, an eminent physician and medical professor, youngest son of the preceding, was born at Edinburgh, March 24, 1738. He studied at the university of that city; and in October 1755, obtained the degree of M.D. In July following, he was appointed joint Professor of Anatomy and Surgery with his father in the university of Edinburgh. He attended for some time the anatomical lectures of Professor Meckell at the university of Berlin. He also visited Leyden. Admitted a licentiate of the Edinburgh Royal College of Physicians, 1758, he was elected a Fellow, 1759, and was afterwards president. On the resignation of his father in the latter year, he became full Professor of Anatomy, and also succeeded him as Secretary of the Philosophical Society, which in 1783 was incorporated by royal charter, and took the name of the Royal Society of Edinburgh. In 1757, he published at Berlin a short treatise, "*De Venis Lymphaticis Valvulosis*," in support of the theory, that the valvular lymphatics over the whole of the animal body are one general system of absorbents; which led to a controversy with Dr William Hunter of London. Among his other works are—"On the Structure and Functions of the Nervous System," a large illustrated folio volume (Edin. 1783); "On the Structure and Physiology of Fishes," also an illustrated folio volume (Edin. 1785); "Description of all the Bursæ Mucosæ of the Human Body" (Edin. 1788); and "Three Treatises on the Brain, the Eye, and the Ear," illustrated by plates (Edin. 1797, 4to). He was a member of the Royal Academies of Paris, Madrid, Berlin, Moscow, and other learned institutions, and one of the first Fellows of the Royal Society of Edinburgh, to whose "Transactions" he contributed various papers. In 1793, his son, Dr Alexander Monro, *tertius*, was conjoined with him in the professorship; and in 1808 he finally retired from the anatomical chair, and from his extensive practice. He died October 2, 1817, in his 87th year.

MONRO, Alexander, *tertius*, anatomical professor, son of Dr Alexander Monro, *secundus*, born at Edinburgh, November 5, 1773, was educated at the High School and university of that city, and studied medicine, anatomy, and surgery in London. In 1793, he became joint Professor of Anatomy with his father, and the following year he took his degree of M.D. In 1803, he instituted the class of Practical Anatomy in the university of Edinburgh; and in 1808 he succeeded his father in the anatomical chair. In 1828, he was President of the Royal College of Physicians of Edinburgh; and he contributed many valuable papers to its "Transactions." He was also a Fellow of the Royal Society of Edinburgh. He retired from his chair in 1847, with the title of Emeritus Professor of Anatomy; and thus ended the connection between the college of Edinburgh and the family of Monro, which lasted for more than a century and a quarter. He died at his seat of Craiglockart, near Edinburgh, March 10, 1859. He was the author of "Observations on Crural Hernia," plates (Edin. 1803); "The Morbid Anatomy of the Gullet, Stomach, and Intestines," plates (Edin. 1811); "Outlines of the Anatomy of the Human Body" (4 vols. 8vo, Edin. 1813); and other professional works.

MONROE', a city of Michigan, United States of America, is situated on the river Raisin, 2 miles from Lake Erie, and 52 miles south-west of Detroit. It is the eastern terminus of the Michigan Southern Railway. It has a large court-house, 7 churches, woollen manufactures, flour-mills, &c. Pop. (1860) 4280. M. was settled by the French in 1776.

MONROE, James, fifth president of the United States of America, was born in Westmoreland County, Virginia, April 28, 1758. He was descended from a Captain Monroe of the army of Charles I., who emigrated, with other Cavaliers, to Virginia. James M. entered the revolutionary army at the age of 18, as a cadet, and was present at several battles; but having lost his rank in the army by serving as aide-de-camp, he commenced to study law with Jefferson. In 1782, he was elected to the Assembly of Virginia, and at the age of 23, to the Executive Council. Next year he was elected to Congress, where he took an active part in the movements for framing a new constitution. He joined with Patrick Henry and other leading States' Rights men in opposing the ratification. He feared the power and encroach-

ment of the Federal government. He was afterwards sent by Washington as minister to France, and was received with singular enthusiasm by the revolutionary government. He was, however, soon recalled, for having too decided French sympathies. In 1799, he was elected governor of Virginia; and in 1803 sent by Jefferson as minister to France, to purchase Louisiana, which vast territory he secured for 15,000,000 dollars. He was now employed for several years in diplomacy in England and Spain. On the election of Mr. Madison to the presidency, he was made Secretary of State, and also performed the duties of Secretary of War. In 1816, his eminent services were rewarded by his being elected President of the United States by the Democratic Republican party, and he made himself very popular. The acquisition of Florida from Spain, and the settlement of the vexed question respecting the extension of slavery by the Missouri Compromise, by which, after the reception of Missouri as a slave state, the institution was prohibited above the line of latitude  $36^{\circ} 30'$ , helped to secure his re-election in 1820. His most popular acts, perhaps, were the recognition of the independence of Mexico and the South American republics, and the promulgation of what has since been called the "Monroe Doctrine," in which he declared the American policy of "neither entangling ourselves in the broils of Europe, nor suffering the powers of the Old World to interfere with the affairs of the New," and that "any attempt to extend their system to any portion of this hemisphere, would be dangerous to our peace and safety." In 1822, he retired to his seat at Oak Hill, Loudoun County, Virginia; but he still continued in the public service. After being twice president, he acted as justice of the peace, a visitor of the university of Virginia, and member of a State Convention; but a profuse generosity and hospitality caused him to be overwhelmed with debt, and he found refuge with his relations in New York, where he died in 1831—like his predecessors, Adams and Jefferson, on the 4th of July. He was an honorable and able statesman, though not a speaker or a man of brilliant talents.

**MONS** (Flem. *Berghen*), an important town of Belgium (formerly fortified), capital of the province of Hainaut, on the Trouille, 35 miles south-west of Brussels. Its fortifications were renewed and strengthened since 1818, but in 1866, in accordance with the new arrangement for the defence of the country, they were demolished. The immediate vicinity can be laid under water by altering the course of the Trouille. The *Canal de Condé* connects the town with the Scheldt, and there is communication by railway with Brussels, Valenciennes, Charleroi, &c. Its principal architectural ornament is the cathedral of St Wandru, dating from the 15th and 16th centuries—a masterpiece of Gothic. The chief manufactures are woollen and cotton goods, cutlery, small-ware, and sugar-refining. The vicinity forms an extensive coal-field, with about 400 pits. A large trade is carried on in coals, flax, hemp, horses, and cattle. Pop. (1875) 24,539.

**MONSIELICE**, a walled town of North Italy, 13 miles south-east of Padua, on the canal of Monselice, which extends from Padua to Este. M. was a place of importance in the middle ages. It has several silk-mills. Pop. 8160.

M., supposed to occupy the site of a Roman station, was made the capital of Hainaut by Charlemagne in 804. During the 17th and 18th centuries, it was frequently the object of contest between France and Austria.

**MONSOON** (Malayan, *Musim*) is derived from the Arabic word *Musim*, a set time or season of the year, and is applied to those winds prevailing in the Indian Ocean which blow from the south-west from April to October, and from the opposite direction, or north-east, from October to April. The existence of these winds was made known to the Greeks during the Indian expeditions of Alexander, and by this knowledge, Hippalus was emboldened to sail across the open sea to Muzeris, the emporium of Malabar. The monsoons depend, in common with all winds whether regular or irregular, on the inequality of heat at different places and the earth's rotation on its axis; but more particularly they are occasioned by the same circumstances which produce the trade-winds and the land and sea breeze, being, in fact, the combined effect of these two sets of causes.

If the equatorial regions of the earth were entirely covered with water, the trade-winds (see **TRADE WINDS**) would blow constantly from the north-east in the north, and from the south-east in the south of the torrid zone, with a belt of variable winds and

calms interposed; the whole system, following the sun's course, moving northward from December to June, and southward from June to December. But, especially in the eastern hemisphere, large tracts of land stretch into the tropics, and give rise to the extensive atmospheric disturbances for which those parts of the earth are so remarkable. During the summer half of the year, the north of Africa and the south of Asia are heated to a higher degree than the Indian Ocean, while Australia and South Africa are much colder. As the heated air of Southern Asia expands and rises, and the colder air from the south flows in to supply its place, a general movement of the atmosphere of the Indian Ocean sets in towards the north, thus giving a *southerly* direction to the wind; but as the air comes from those parts of the globe which revolve quicker to those which revolve more slowly, an easterly direction will be communicated to the wind; and the combination of these two directions results in the south-west monsoon, which prevails there in summer. Since, during winter, South Asia is colder than the Indian Ocean, which, again, in its turn, is colder than South Africa, a general motion of the atmosphere sets in towards the south and west. As this is in the same direction as the ordinary trade-wind, the effect in winter is not to change the direction, but only to increase the velocity of the trade-wind. Thus, while south of the equator, owing to the absence of sufficiently large tracts of land, the south-east trade-winds prevail throughout the year; on the north of the equator we find the south-west monsoon in summer, and the north-east in winter; it being only in summer and north of the equator that great changes are effected in the direction of the trade-wind.

Similar, though less strongly-marked monsoons prevail off the coasts of Upper Guinea in Africa, and Mexico in America. The east and west direction of the shores of these countries, or the large heated surfaces to the north of the seas which wash their coasts, produce, precisely as in the case of South Asia, a south-west monsoon in summer. As might have been expected, the monsoon off the coast of Mozambique is easterly, and that off the coast of West Australia north-westerly. The trade-winds also suffer considerable change in their direction on the coasts of Brazil, Peru, Lower Guinea, &c. These, though sometimes considered monsoons, are not truly such, for they do not change their directions periodically, so as to be opposite to each other, like true monsoons, but only veer through a few points of the compass. For a fuller account of these partial deflections, see TRADE-WINDS.

In April, the north-east monsoon changes into the south-west; and in October, the south-west into the north-east. These times depending on the course of the sun, and consequently varying with the latitude, are called the breaking up of the monsoons, and are generally accompanied by variable winds, by intervals of calm, and by furious tempests and hurricanes.

Monsoons, when compared with the trade-winds, will be found to play a most beneficial and important part in the economy of the globe. Their greater velocity, and the periodical changes which take place in their direction, secure increased facility of commercial intercourse between different countries. But the full benefits following in their train are not seen unless they be considered in their relation to the rainfall of Southern Asia. Indeed, the fertility of the greater part of this fine region is entirely due to the monsoons; for if the north-east trade-wind had prevailed there throughout the year, Central and Western India, and many other places, would only have been scorched and barren saharae. The rainfall of India depends entirely on the monsoons. The coast of Malabar has its rainy season during the south-west monsoon, which brings thither the vapors of the ocean. On the Coromandel coast, on the other hand, it is the north-east monsoon which brings the rain from the Bay of Bengal. The two coasts of Hindustan have therefore their seasons reversed, the dry season of the one corresponding with the wet season of the other.

MONSTRANCE (Lat. *monstrare*, to shew), called also OSTENSORY, the sacred utensil employed in the Roman Catholic Church for the purpose of presenting the consecrated host for the adoration of the people, as well while it is carried in procession, as when it is exposed upon the altar on occasions of special solemnity and prayer. The use of the monstrance probably dates from the establishment of the festival of Corpus Christi in the 13th century. It consists of two parts, the foot or stand upon which it rests, and the repository or case in which the host is exhibited. The latter contains a small semicircular holder called the *lumula*, or crescent, in which the host is fixed; and it appears anciently to have been of a cylindrical or

tower-shaped form, in the central portion of which, consisting of a glass or crystal cylinder, the host was placed. At present, it is more commonly in the form of a star or sun with rays, the central portion of which is of glass or crystal, and serves to permit the host to be seen. This portion, or at least the crescent, is of gold or of silver gilt; the rest is generally either of the precious metals, or at least gilt or silvered, although the lower portion is occasionally of bronze, artistically wrought. In many cases, it is of most costly materials and workmanship. The monstrance, like the other vessels used in the Eucharistic service, is consecrated by a bishop, or a priest delegated by a bishop. By a peculiar usage of the city of Lucerne, in Switzerland, the Eucharist is always carried in the monstrance, when being borne to the sick.

**MONSTROSITY**, in Anatomy. When an infant, or the young of any animal comes into the world impressed with morbid changes, which occur only in fetal life, and of which it has never been observed that they have originated in the same way after birth, such an infant or young animal is said to be a monster or monstrosity. Monsters were formerly regarded as prodigies of nature; and in the dark ages, their occurrence in the human species was usually ascribed to the intercourse of demons and witches. It is now perfectly understood that the formation of those apparently anomalous beings may be accounted for by the same laws as those which govern the formation of perfect individuals—the only difference being, that these laws in the case of monstrosity are more or less arrested or otherwise perverted.

Amongst the principal causes of monstrosity may be mentioned: 1. Something deficient or abnormal in the generative matter of one or both parents, because, as has been shewn in the article **HEREDITARINESS**, malformations are frequently transmitted from parents to the children. Here the morbid change is impressed upon the fetus at the moment of impregnation. 2. Some morbid condition of the maternal organs or constitution may exercise a disturbing influence upon development. 3. Diseases and abnormal states of the placenta, of the membranes of the ovum, and of the umbilical cord, may induce an arrest of development; for example, it may be easily understood how abnormal shortness of the cord may favor the origin of fissure of the abdomen; while a cord of disproportional length may coil round one of the extremities, and by constriction may dwarf it, or even amputate it. 4. Morbid influences acting directly on the fetus, as mechanical injuries and diseases affecting it, are the most frequent causes of malformations. From the experiments of several observers, it has been shewn, that by submitting hens' eggs to various mechanical influences during incubation, the development of the embryo may be interrupted, or modified in such a manner as to give rise to malformations; and many observations tend to prove, that mechanical influences affecting the womb (kicks, blows, or falls) in the early months of pregnancy, produce certain malformations, by causing an arrest of development. Moreover, the fact, that certain malformations usually occur only in twin or triplet pregnancies, favors the view, that certain monstrosities are due to pressure and confined space.

Of the various classifications of monstrosities, the following is perhaps the best: 1. Malformations in which certain parts of the normal body are entirely absent, or are too small. 2. Malformations produced by fusion or coalescence of organs. 3. Malformations in which parts naturally united, as in the mesial line of the body, are separated, and clefts or fissures occur. 4. Malformations in which natural openings are closed. 5. Malformations of excess, or in which certain parts have attained a disproportional size. 6. Malformations in which one or more parts have an abnormal position. 7. Malformations of the generative organs.

The *first class* includes (1) completely shapeless malformations, in which the monster presents the appearance of a lump or mass, with no indication of definite organs; (2) malformations which consist of only a more or less rudimentary trunk, with no head or extremities; (3) trunkless monsters, in which the inferior parts of the body are wanting, and little more than a rudimentary head is present, which, instead of neck and trunk, is furnished with a pouch-like appendage, containing rudimentary viscera and pieces of bone; (4) malformations in which the head and sometimes a part of the upper part of the body, are wanting, constituting acephalic monsters, which are by no means rare, the number of recorded cases in the human subject being over 100; (5) malformations in which the whole head is not absent, but some of its component parts are wanting—as, for example, the brain, some of the cranial bones, the nose, or the eyes; (6) cases in which the extremities are absent or

imperfect to a greater or less degree—for example, they may be mere stumps, with the fingers and toes either absent or rudimentary, or the hands and feet may appear to exist independently of arms and legs, and to be inserted immediately into the trunk; (7) cases in which all the organs may be present, but some of them may be too small—thus, there may be general dwarfishness, or the head or limbs may be abnormally small. None of the monsters of this class, except those included in the last two groups, are viable.

In the *second class* are included such cases as (1) the various forms of *cyclopia*, or coalescence of the eyes; these malformations are not very rare in the human subject, and are of frequent occurrence in pigs and other animals; although usually born alive, these monsters are not viable; (2) coalescence of the lower extremities either into a common limb, which supports two feet, or into an undefined tail-like mass; (3) minor amalgamations, which do not affect vitality, as more or less perfect coalescence of the fingers and toes.

The *third class* embraces such cases as (1) fissures of the cranium, which are generally due to hydrocephalus in the fœtus; (2) harelip and cleft palate; (3) fissures on the neck, whose origin is due to the respiratory clefts—which, during the formation of the embryo, appear in the cervical region, not uniting at an early stage, as in the normal condition, but remaining more or less open; (4) fissures of the vertebral arches of the spinal column, occasioning the affection known as *spina bifida*; (5) fissures of the thorax, in which case the lungs or heart are more or less exposed; (6) fissures of the abdomen.

The malformations of the *fourth class* include congenital closure of the anus, the mouth, the nostrils, &c.

The malformations of the *fifth class* may be arranged in two divisions, according as certain parts are too large, or there are supernumerary organs.

The *sixth class* is very extensive, and embraces many varieties. One or more parts may be disproportionally large—as, for example, the head in cases of congenital hydrocephalus; or there may be one or several supernumerary organs—a sub-class which presents a very great range, from the simplest cases, in which a single joint of a finger is supernumerary, to those of a highly complicated nature, when two or even three bodies are united by some one point. There may be a single head and trunk and supernumerary parts—as, for example, supernumerary teeth, vertebrae (giving rise to the formation of a tail in the human subject), ribs, mammae, fingers, toes, &c.; or there may be malformations with more than one head and trunk—double, or even triplet monsters. This sub-class is divisible into two groups, according as the united individuals are equally developed, or as only one is developed; the second being more or less atrophied, and forming a parasitic appendage to the first. As examples of the first group, we mention (1) duplication of the head and upper part of the vertebral column; (2) duplication of the head, neck, and upper extremities, while the chest and abdomen are single, or fused into one another (in this group, we must place the twin-monster, Rita Christina, who was born in Sardinia in March 1829, and was brought alive to Paris, where she died in the November of that year); (3) almost complete duplication, with separation of the two bodies, except at a single spot, as in the case of the Siamese twins; (4) triplet monsters, such as the child with three heads born in 1833 in Catania (see Geoffroy St Hilaire, "Histoire des Anomalies de l'Organisation," vol. iii. p. 327). To the second group belong such cases as the following: (1) a perfect individual may bear on its head another head, with traces of the rest of the body; (2) on a well-developed body, a second, smaller and defective one, may be situated, which, after birth, does not increase in size; (3) in a more or less perfectly developed individual, there may be concealed, commonly in the abdomen, parts of a second individual—a condition which has received the name of *fœtus in fœtu*, and which is most probably caused by the inclusion of one germ by another.

To the *sixth class* belong (1) those cases in which there is a reversal of the position of the internal organs—when the heart and spleen lie upon the right, and the liver and cæcum on the left side; (2) anomalies in the course and distribution of individual vessels.

The malformations constituting the *seventh class* have been sufficiently noticed in the article HERMAPHRODITISM.

The term *Teratology* (from the Greek words *teras*, a prodigy, and *logos*, a dis-

course) is now frequently applied to the history and science of monstrosities.—For further information on this subject, the reader is referred to Geoffroy St Hilaire, "Histoire des Anomalies de l'Organisation" (3 vols. 1832—1836); Otto, "Monstrosum & excentricum Descriptio Anatomica" (1841); and to the article "Teratology," by Vrolik, in "The Cyclopædia of Anatomy and Physiology."

**MONSTROSITY**, in Botany, is a malformation or abnormal development of any part of a plant. It may take place, however, at any period of the growth of a plant, as to any new organ that is developed, and sometimes merely affects a particular organ or some portion of a plant, as a particular leaf, flower, petal, sepal, &c., or the leaves or flowers of a particular branch, whilst in other cases all the organs of the same kind exhibit the same abnormal character. As in animals, it is now well known that monstrosities in plants are the result of special conditions affecting the operation of ordinary natural laws; and the study of monstrosities is very important in relation to that of the nature, development, and metamorphosis of organs. In the article **METAMORPHOSIS OF ORGANS**, some of the most frequent monstrosities are alluded to. Monstrosities in plants are not always, as in animals, reckoned deformities. *Double flowers* afford a familiar example of an opposite kind; although with regard to the plant itself they have the effect of unfitting it for one of the functions of a perfect plant, reproduction by seed.

**MONTAGNA'NA**, a town of Northern Italy, in the province of Padua, situated pleasantly on the banks of a canal, Il Fiumicello, 82 miles south-west of Padua. It is still protected by walls and towers, and has a fine cathedral and palace. Pop. 7657. Its chief trade is in spun-silk, wool, hemp, and coarse cotton textures.

**MONTAGNARDS**, or simply Montagne, "the Mountain," the name given to the extreme democratic politicians in the first French Revolution, because they seated themselves on the higher benches of the hall in which the *National Convention* met. Their principal members were Danton, Marat, Robespierre, St Just, and Collot d'Herbois, the men who introduced "the Reign of Terror." The opposite party of the "Plain" (*Plaine*) were the Girondists (q. v.), who sat on the lowest benches on the floor of the house. After the overthrow of the Girondists, this part of the house was styled the "marsh or swamp" (*marais*), and included all the subservient members whose votes were under the control of "the Mountain." A few leading men gave all its strength and formidable character to the party of the Mountain.—After 1848, the extreme party in the *National Assembly*, composed of revolutionary democrats and communists, sometimes flattered itself with the designation of "the Mountain;" but events proved that it possessed nothing of the genius, though it shewed all the malignity of its predecessor.

**MONTAGU**, Family of. This noble family are said, by Burke, to derive their name, which in Latin was and is always written De Monte Acuto, from a place in Normandy; and the first of the Montagus who settled in England was a warrior who came over in the train of Robert Earl of Moreton at the Conquest. Five centuries later, we find his descendant, Sir Edward Montagu, Lord Chief-justice, in succession, of the courts of King's Bench and Common Pleas under Henry VIII., who also appointed him one of the executors of his will and guardians of his son Edward. His grandson, who was a distinguished orator, represented the city of London in parliament; and having been Lord Chief-justice of the Court of King's Bench, and Lord Treasurer of the kingdom, was raised to the peerage as Earl of Manchester. The second earl gained distinction as a general in the Parliamentary army, and more particularly by his victory over Prince Rupert at Marston Moor; but he scrupled to take part in the condemnation and execution of Charles, and was one of the first members of the House of Peers who gave in his adhesion to Charles II. on his restoration. This nobleman's grandson enthusiastically espoused the cause of William III., under whom he fought at the battle of the Boyne, and took part in the siege of Limerick. He was subsequently sent as ambassador to Venice, and to the courts of France and Vienna, and eventually was raised to the dukedom of Manchester by George I. The title is still enjoyed by his descendant, the 7th duke. Other branches of the M. family were ennobled in the persons of the Earl of Sandwich, the Earl of Halifax, and the Duke of Montagu, but the last two titles both became extinct before the close of the 18th century.

**MONTAGU, Lady Mary Wortley**, was eldest daughter of Evelyn, Earl, and afterwards (1715) Duke of Kingston. She was born about 1690, and is said to have received a classical education. When only eight years of age, she was introduced by her father to the famous *Kit-Cat Club*, and formally admitted a member. Her fond and pleasure-loving father allowed her to educate herself. She is even said to have taught herself Latin. She became attached to Mr E. Wortley Montagu, a member of the House of Commons, whose cousin, Charles Montagu, was created Earl of Halifax, and appointed First Lord of the Treasury, by George I. As the match was disapproved of by the families, she was obliged to elope before she could marry him. On the accession of George I., she came to London with her husband, who was a Whig. Lady Mary's beauty and wit attracted universal admiration at court. She was in habits of familiar acquaintance with Addison and Pope, the latter becoming her enthusiastic admirer, and writing "flames and raptures" for her, until his passion "came to a climax in an impertinence, and was extinguished by a box on the ear, or some such rebuff." In 1716, Mr Wortley Montagu was appointed ambassador to Constantinople. He was accompanied by Lady Mary, who, on her journey, and during her residence in the Levant, wrote the well-known "Letters," which form one of the most delightful books in our language. The weaknesses of a somewhat vain and capricious temper fade into forgetfulness, when we remember the strong sense, enlightened courage, and generous perseverance which introduced into Europe the practice of inoculation, which she witnessed in Turkey. She had so much faith in its safety, that she tried it at first on her own son. See **INOCULATION**. After her return to England, she fixed her residence at Twickenham, and renewed her intimacy with Pope. But political soon led to personal differences, and these resulted in one of the most famous literary feuds of the 18th century. The immediate occasion of it was the publication by Lady Mary of her "Town Eclogues." She was fiercely assailed by both Swift and Pope, and was not slow to retaliate. In 1737, she left her country and her husband (for reasons that are not known), and lived for many years in Italy, chiefly at Lovers, in the province of Venice. Her husband died in 1761. At the request of her daughter, afterwards wife of the Earl of Bute, she returned to England, where she died 21st August 1762. A collected edition of her works, with life, was published by her great-grandson, the late Lord Wharfedale, in 1836, of which a third edition appeared in 1861.

**MONTAIGNE, Michel Eyquem de**, a distinguished French moral philosopher, was born in 1533, at his paternal home of Montaigne, in Perigord. In accordance with his father's eccentric ideas on education, he was taught, and suffered only to speak Latin from his earliest infancy, in consequence of which he acquired such a perfect mastery over the language, that when, in his tenth year, he entered the college of Bordeaux, his masters, Granchi, Buchanan, and Murer, were almost afraid to address him. On the expiration of his course of studies, which were directed to law, he received, in 1554, the appointment of councillor in the parliament of Bordeaux; but being possessed of ample means, and having no inclination for a public life, he devoted himself to the study of the various schools of Greek and Roman philosophy; and on the death of his father, in compliance with whose wish he had made a translation of the natural theology of Raymundus Seboudas (Paris, 1569), he retired to his ancestral estate, where he lived in retirement during the terrible season of religious oppression which desolated France for so many years. During this period, 1580, he composed the first two books of his celebrated "Essays," the third portion of which appeared in 1588, after his return from an extensive course of travels, which he had undertaken partly for escape from the plague, and partly for the improvement of his own health, and during which he visited Rome, and was received with signal favor by the pope. M.'s "Essays," although not conceived in the spirit of a believing Christian, or marked by the reticence and delicacy of expression which modern refinement demands, are very extraordinary productions, not only for the learning and sound reasoning which they manifest, but also for the frank and liberal tone in which social questions are discussed, notwithstanding that the author wrote at a period when religious differences and party feelings blinded the judgments of men. M.'s ethics were those of Seneca and the other philosophers of ancient times, whose works he had so thoroughly mastered; and, judged from our point of view, his morality is that of a virtuous pagan merely; but when we bear in mind the turmoil of civil war, and the

consequent disorganisation of society, together with the low ebb of literature in France at that period, we must do justice to the great merit of the writer, and the influences for good which his writings exerted. M. was a constant, and occasionally a successful, mediator between the party of Henry of Navarre and that of the Guises, and stood in relations of friendship with men of all creeds. He died in 1592, as an avowed member of the Church of Rome, in whose doctrines he professed implicit faith, notwithstanding the sceptical bias which he had through life been at no pains to conceal. Numerous editions have appeared of his "Essais," among which we may instance those of De Coste (5 vols. Hag. 1727), and Victor Leclerc (Paris, 1826). Nearly 200 years after his death, the discovery was made at Montaigne of the MS. of his travels, which was published at Paris in 1774, under the title of "Journal de Voyage de M. de M. en Italie par la Suisse et l'Allemagne." Translations of the "Essais" exist in almost all the European languages; the best English translation is that by Cotton. The best biographies of M. are by Grûn (Paris, 1855); Payen (Paris, 1856); and Bayle St John (Lond. 1857).

**MONTALCINO**, a town in the province of Siena, Central Italy, 22 miles south-south-east of the town of Siena, stands on a hill in the midst of valleys, and enjoys a fine equable climate. Pop. 7540. The wine of M. is in high repute throughout Tuscany.

**MONTALEMBERT**, Charles Forbes, Comte de, was born in April 1810 of an ancient family of Poitou. His father was created a peer of France under the Restoration, and for a considerable time was minister of the French court in Sweden. His mother was of the Scottish family of Forbes, to which circumstance may be ascribed M.'s remarkable familiarity with the English language, and his intimate knowledge and strong admiration of the social and political institutions of England. Although his more advanced studies were carried on in the university of Paris, a considerable part of his youth was spent in Sweden; and the first work by which he was brought into notice, was a pamphlet on Sweden, which he published in his nineteenth year. On the death of his father, M. succeeded to his honors, and to his seat in the Chamber of Peers. But his earliest public appearance was in what may be truly considered as the great labor of his life, a joint effort in which he associated himself with the Abbé Lacordaire (q. v.) and other friends, for the purpose of taking advantage of the recent charter, by establishing a free school for Catholic education, independent, as well of the university, as of all other state influence. An attempt on the part of the police to interfere arbitrarily with this project, became the subject of a trial before the Chamber of Peers, which M. rendered memorable by his first speech, one of the most brilliant upon record, and a clear foreshadowing, not alone of the eloquence, but of the bold and uncompromising earnestness in the cause of his church and of the common interests of religious liberty, which have constantly characterised his later career. Of the struggle of the Catholic party in France against what they regarded as the arbitrary monopoly of education which was claimed for the university, M. was for many years the leader and the champion; and in the various works in the preparation of which he employed all his leisure from public duties, his "Life of St Elizabeth of Hungary," his "Life and Times of St Anselm," and, above all, in an appeal "On the Duty of Catholics on the Question of Freedom of Education," which he wrote during a visit to the island of Madeira for the recovery of his health in 1843, he never ceased to advocate the same principles. After the revolution of 1848, M., true to his former professions, was one of the first of his party to accept of the new state of things, and to see the actual means at his disposal for the furtherance of the views which he had consistently advocated. He was elected member of the National, and afterwards of the Legislative Assembly; and for a time contrived, while he continued the same line of policy as regards church interests, to give a general support to the government of Louis Napoleon as president of the republic. His first break with that government was on the question of the proposed confiscation of the Orleans property; and after the *coup d'état* of December, the breach became irreconcilable. From that time, M. continued to be the implacable assailant of the arbitrary repression of public opinion which characterised some measures of Napoleon III.; and the brilliant and enthusiastically admiring pictures, which in his "Political Future of England," he has drawn of its social and

Montana  
Mont

216

political institutions, derive much of their vigor from the covert but palpable contrast with the condition of France which points them all. Besides numerous articles contributed by him to the "*Revue des Deux-Mondes*," the "*Encyclopédie Catholique*," and the "*Correspondant*," he also wrote: "*L'Avenir politique de l'Angleterre*" (1855); "*Les Moines d'Occident depuis St Benoît jusqu'à St Bernard*" (1860—1867; English translation, 5 vols. 1861—1867); "*Une Nation en deuil, la Pologne en 1861*"; "*L'Eglise libre dans l'Etat libre*" (1863); "*Le Pape et la Pologne*" (1864), &c. He died 13th March 1870. See Memoir by Mrs Oliphant, 2 vols. (1872).

MONTANA, a territory of the United States, formed in 1864, extending from lat. 45° to 49° n., and long. 104° to 116° w. It is mostly to the east of the Rocky Mountains, and is bounded, n. by British America, w. by Washington and Idaho, s. by Wyoming, e. by Dakota. Its average length is 470 miles, its average breadth 275 miles, and its area 143,776 sq. miles, or 92,016,640 acres, of which, in 1870, 84,674 were under cultivation. M. has great mineral wealth, not yet fully taken advantage of, including gold, silver, galena, copper, coal, and precious stones. Its yield of bullion in 1866 was valued at \$16,500,000; in 1874, \$4,000,000. It is exceedingly well watered, the chief rivers being the Missouri and Yellowstone, with their affluents, and the Columbia. M. is well adapted for grazing. Pop. (1880) 39,159, besides 22,496 tribal Indians.

MONTANUS, a celebrated heresiarch of the early Christian Church, was a Phrygian by birth, and made his first public appearance about 160 A.D., in the village of Ardabur, on the confines of Phrygia and Mysia. He was brought up in heathenism, but embraced Christianity with all the fanatical enthusiasm for which his countrymen were noted.

M.'s stand-point was, *in theory*, the exact opposite of that occupied by the Gnostic sects; yet, *in practice*, it led to a similar exclusiveness and sectarianism. He believed in the constancy of supernatural phenomena *within* the church. The miraculous element, particularly the prophetic ecstasy, was not removed; on the contrary, the necessity for it was greater than ever. He considered those only to be true or perfect Christians who possessed the inward prophetic illumination of the Holy Spirit—they were the true church; and the more highly gifted were to be looked upon as the genuine successors of the apostles, in preference to the mere outwardly consecrated bishops. Thus, they formed a religious aristocracy, as arrogant as the Gnostics; the difference between the two simply being, that the Montanists prided themselves on a kind of inflamed inspiration, and the Gnostics on a calm and serene illumination of the reason. Neither party wished to recede from the Catholic Church, but rather to exist as an esoteric body within its pale. It was persecution, caused, no doubt, by their own insolent obstinacy, that forced them into a sectarian course. M. did not meddle directly with the creed of the church; in fact, he was not a thinker, nor a man of almost any importance intellectually. His efforts were confined to stirring up the Christians generally to fresh religious life—to a belief in a fresh outpouring of the Holy Ghost! At first, M. contented himself with predicting fresh persecutions, exhorting men to greater strictness and holiness of life, and announcing judgments to come upon the persecutors; but his idea of his own mission afterwards became more exalted, and he claimed to be in a very special sense a prophet of God—the organ chosen by the Holy Ghost to purify, enlighten, and advance the church. Among the things on which the Montanists laid stress, was an ascetic mode of life, scorn of persecution, and love of martyrdom; connected with these, and, indeed, flowing from them, was an aversion to second marriages, and to the restoration of the LARSEN (q. v.). Like other enthusiasts, they also were firm believers in the near approach of the Millennium (q. v.), and in the personal advent of Christ. Two "prophetesses," Priscilla and Maximilla, were associated with M. in his work. A decree for the expulsion of M. and his followers from the communion of the Catholic Church was issued by Eleutherus, Bishop of Rome. The Montanists at once proceeded to organise themselves as a distinct sect. They found a singularly able apologist in Tertullian (who became a Montanist about 200 A.D.), and continued to exist till the 6th century.

MONTARGIS, a town of France, department of Loiret, is situated at the junction of the canals of Orleans and Briare with that of Loing, 40 miles east-north-east

of the city of Orleans. M. has some cloth and leather manufactures, and considerable trade in corn, cattle, &c. Pop. (1876) 9175. In its vicinity is an extensive forest of the same name.

**MONTAUBAN** (Lat. *Mons Albanus*), a town of France, capital of the department of Tarn-et-Garonne, is situated in a rich and beautiful country on a plateau between the rivers Tarn and Tescou, 52 miles north of Toulouse. It is the seat of a bishop, has a fine cathedral in the Italian style, finished in 1739, built on the site of a still older monastery, the *Mons Aureolus* (Golden Hill), and is a well-built, handsome town. The houses are mostly of brick. Besides having considerable manufactures, it carries on a great trade in wine, grain, leather, &c. M. was founded in 1144 by Count Alphonse of Toulouse, became the seat of a bishop in 1317, embraced the Reformation in 1572, and suffered severely in the civil wars that ensued. It has acquired historical celebrity as the great stronghold of the Huguenots. Protestantism still exists here, and maintains both an academy and a theological college. Pop. (1876) 19,790, nearly one-half of whom are Protestants.

**MONTBELIARD** (Ger. *Mömpelgard*), a town of France, in the department of Doubs, 36 miles north-east of Besançon. It lies in a valley between the Vosges and Jura Mountains, is surrounded by an old château, now used as a prison, and carries on manufactures of cotton goods, hosiery, and silks. Clocks, watches, and agricultural implements are also made. Pop. (1876) 7625.

**MONT BLANC**, the highest mountain in Europe, and, according to the latest measurements, 15,781 feet above the level of the Mediterranean Sea, is one of the Graian Alps, and is situated in the department of Haute-Savoie, France, close to the Italian frontier, and 37 miles south of the east end of the Lake of Geneva. The *valles* of Chamouni and Mountjoie lie on the west, and those of Ferret and Allée Blanche on the east side of it. The waters which spring from its western slopes are drained off to the Arve, and thence to the Rhone, while those which rise on the east side are feeders of the Dora Baltea, a tributary of the Po. It has 3 snow-clad peaks, and 36 glaciers, of which 16 lie on the north, and 20 on the south side. The highest summit is a narrow ridge 50 yards by 16, called *La Bosse du Dromedaire*, covered with firm snow, and very steep towards the north. In 1760, Saussure offered a prize for the discovery of a practicable route to the summit of Mont B., which was gained, in June, 1786, by Jacques Balmat, a guide. Saussure himself ascended the mountain the following year; and the same feat has since been performed by many, especially since Albert Smith published the well-known pictorial and dramatic description of his ascent in 1851.

**MONTBRISON**, a town of France, capital of the dep. of Loire, 37 miles south-west of Lyon, on the Vizezy, a feeder of the Loire, stands at the base of a lofty and precipitous rock. In the vicinity are mineral springs. Pop. (1872) 5336.

**MONT CENIS.** See **CENIS**.

**MONT-DE-MARSAN**, a town of France, capital of the dep. of Landes, at the junction of two streams—the Midon and Donze—which, when united, take the name of Midouze, and join the Adour. It is 65 miles south of Bordeaux, with which and with other places it is connected by railway. The town has of late years made great progress. It has a communal college, and mineral warm baths. There are manufactures of common woollen cloths, blankets, sail-cloth, and leather. Pop. (1872) 6964.

**MONT DE PIÉTÉ**, called in Italy *Monte di Pietà*, a charitable institution, the object of which is to lend money to the very poor at a moderate rate of interest. It had its origin at the close of the mediæval period, when all such transactions were in the hands of usurers, to whom the necessities of the poor were but an inducement to the most oppressive extortion. The earliest of these charitable banks appears to have been that founded at Padua in 1491, which was so successful as to lead, according to contemporary writers, to the closing of the Jewish banks in that city. The first opened at Rome was under Leo. X.; and the Roman *Monti di Pietà* are confessed to have been at all times the most successful and the best managed in Italy. The institution extended to Florence, Milan, Naples, and other cities. The principle of all was to advance small sums on the security of pledges, but at a rate of interest barely sufficient to cover the working expenses. Should any surplus remain, it was to be expended for charitable purposes. The *Mont de Piété* system was introduced

Montebello  
Montenegro

218

also in Spain, France, Belgium, Germany, and the Netherlands. In 1873, there were in France 46 *Monts de Piété*, making yearly loans of 60,000 francs. It formed the model of the Loan Fund Board of Ireland, established by 6 and 7 Vict. c. 91. See PAWN-BROKING.

**MONTEBELLO CASTEGGIO**, a village of Northern Italy, in the province of Pavia, 23 miles east-north-east of Alessandria. It stands in a plain on the banks of the torrent Schizzola. Here the Austrians were defeated by a French army under General Lannes, after a desperate conflict, 9th June 1800. The title of Duke of Montebello was conferred on the victorious French general five years later. It May 1859 the Austrians were again defeated here by the united armies of the French and Piedmontese. See CASTEGGIO.

**MONTE-CASINO**. See CASINO, MONTE.

**MONTE-CATINI**, a village of Tuscany, situated on a spur of the Apennines, 29 miles west of Florence, derives its name from the bowl-shaped hill on which it stands. It is of very ancient origin, and was formerly called *Castello*. In the close vicinity of the town are the famous mineral springs of same name, in high repute for their curative properties, especially in diseases of the liver and digestion. Excellent accommodation can be had by visitors both in private establishments and those under government direction.

**MONTE CHIA'RO**, a town of Northern Italy, in the province of Brescia, situated on a height on the left bank of the Chiese, in the centre of an amphitheatre of hills. Pop. 6933. The chief manufacture is silk. In 1796, the Austrians were defeated here by a French army.

**MONTE CHRISTO**, a small island, belonging to Italy, 26 miles south of Elba. It consists of a mountain of granite 1933 feet above the level of the sea, and is uninhabited except by wild goats and other animals. It is inaccessible except by one narrow landing-place. M. C. has given name to Dumas's well-known novel.

**MONTECUCULLI**, Raimondo, Count, born near Modena, 1608, and entered the Austrian artillery as a volunteer under his uncle, Ernesto, Count Montecucull, in 1627. During the Thirty Years' War he found many opportunities of distinguishing himself, received rapid promotion, and was employed in various services, military and diplomatic. In 1657, he was sent to support the king of Poland, John Casimir, against the Swedes and Rákóczy, which he did with great effect, compelling Rákóczy to make peace with Poland, and to break his alliance with the Swedes. In the following year, he was made a field-marshal, and was sent to aid the Danes against the Swedes, in which also he was eminently successful. In 1660, he commanded the army sent to oppose the Turks, who had broken into Transylvania, and skilfully kept them in check till the arrival of the French, with whose assistance he won the great battle of St Gotthard, on the banks of the Raab, 1st August 1664—the first decided triumph of European tactics and discipline over the mere numbers and daring of the Ottoman hosts. When the war broke out between France and Holland, in which the emperor took part with Holland, M. received the command of the imperial army in 1672. He took Bonn, and notwithstanding the endeavors of Turenne to prevent it, effected a junction with the Prince of Orange. In 1675, he was opposed to Turenne on the Rhine, and they spent four months in manœuvres in which neither could gain any advantage. After this campaign, M. spent the remainder of his days at the imperial court and in the society of learned men. He was himself a man of learning and various accomplishments, and has left works on the art of war, on the Turkish war, and on the war of 1664, and also sonnets. The Emperor Leopold made him a prince of the empire, and the king of Naples bestowed on him the duchy of Mold. He lost his life by the fall of a beam as he was entering Linz with the imperial court, 16th October 1681. His writings were published in the original Italian by Ugo Foscolo (2 vols. Milan, 1807); and by J. Grassi (2 vols. Turin, 1821). A semi-autobiographic memoir was translated into Latin, and published at Vienna, under the title of "*Commentarii Bellici*," in 1718.

**MONTEGO BAY**, a small but flourishing seaport on the north coast of the island of Jamaica, 17 miles west of Falmouth. It has a harbor protected by a break-water, is defended by a battery, and carries on a general trade of some import-

ance. More than 100 vessels annually enter and clear the port. Population variously stated at from 4000 to 5000.

**MONTÉLINAR**, an ancient town of France, in the department of Drome, about two miles from the left bank of the Rhone, and twenty-six miles south of Valence. It stands on the slope of a hill covered with vineyards. There are factories for silk and cotton goods; tanneries, &c. Pop. (1872) 7787.

**MONTÉM CUSTOM**, was a triennial procession of the Eton boys, on Whit-Tuesday, to a certain mound (*ad Montem*) known as the Salt Hill, near the Bath Road, and which was doubtless so called because certain of the boys levied tribute (for salt, as the phrase went) from every person present, and even from any chance passer. These juvenile tax-gatherers were attired in fancy dresses of silk. The king and queen, besides many members of the nobility, frequently honored the procession with their presence; and on such occasions, as much as £1000 has been collected, which was given to the senior scholar to support him at Cambridge. The origin of the custom is unknown. It was discontinued in 1847.

**MONTENEGRO** (an Italian translation of the native name **CZERNAGORA**, "Black Mountain") is a small but independent and recently extended principality situated between Bosnia and Albania. Till 1878 it was separated from the Adriatic by a narrow strip; now it touches the coast for a short distance at Antivari, its only port, which is closed to the navies of all nations—M. being prohibited from having war-ships. M. contains above 2000 square miles, and is everywhere mountainous, the mountains being in most cases clothed with dark forests of fir, ash, beech, oak, hick, willow, and poplar. Mt Dormitor, in the north, is 8200 feet, and Mt Kom, in the east, 8000 feet above sea-level. Agriculture is prosecuted to the utmost extent the country will admit of, but in a rude and primitive manner. The products are those of other European countries in the same latitude. Few oxen are reared, but sheep, goats, and swine abound.

There are no towns in M. save in the recently conceded portion: of them, Podgoritz, (pop. 7500) and Antivari (pop. 3900) are the only ones worthy of mention. Cetigne or Cetinji, the seat of government, contains above a hundred houses, many of them well-built, besides a convent and the palace of the Prince of Montenegro. The villages are unwall'd; the houses, or rather huts, which compose them, are rarely provided with chimneys, and in the elevated districts are more wretched in appearance than even the mud hovels of Ireland.

The Montenegrins or Tzernagorzes are Slavs of the Servian race, and number about 150,000. They are knit together in clans and families, and have many feuds amongst themselves, which are perpetuated by the hereditary obligation of avenging blood. Their chief occupations at home are agriculture and fishing, but they are ever ready for war or pillage. Education among them is at a very low ebb; in fact, it is held in contempt, and many, even among the priests, are unable to read or write. In 1841, several schools were established, and the art of printing introduced; but the unsettled state of the country has hitherto prevented much improvement. Their language is a very pure dialect of the Slavic. They belong to the non-united Greek Church. In 1871 the first newspaper in M. was established.

**Political Divisions and Government.**—M. is divided into the districts of M. Proper, and Brda or Zjeta, each of these being subdivided into four "nahies" or departments, and these are further subdivided, each subdivision having its own hereditary chief. Besides, there are the newly added territories, not yet organized. Until 1851, the head of the government was the *Vladika* ("metropolitan," or "spiritual chief"), who, besides his proper office of archbishop and ecclesiastical superior, was at the same time chief ruler, lawgiver, judge, and military leader. This theocratic administration became (1697) hereditary in the Petrovitch family, but as the vladika cannot marry, the dignity was inherited through brothers and nephews. Since 1851, the two offices have been disjoined, and the vladika is restricted to his ecclesiastical office, while the cares of government devolve upon the "Gospodar" ("hospodar") or lord, though the common people still apply to him the title "sveti gospodar," which properly belongs to the vladika alone. The vladika Pietro II. (1830—1851) established a senate of twelve members, elected from the chief families of the country, and in this body the executive power was vested. Next to the vladika in eccle-

sinal affairs is the archimandrite of the convent of Ostroc. The other public officers, as the Secretary of State, the Chancellor, and the local judges, are appointed by popular election. From time to time, an *Assembly* of all the adult males of the country takes place in a grassy hollow near Cettigne, the capital; but the powers of this assembly are very undefined. For defraying the expenses of government, taxes are levied on each household, the income thus raised amounting to 40,000 Austrian florins, or £4068. Besides this, the prince receives from Russia a subsidy of 8000 ducats (£3733), and from Austria one of 20,000 florins (£2000). As the Montenegrins, even when engaged in agricultural operations, is always armed with rifle, yataghan, and pistols, an army of 26,000 men can be summoned on the shortest notice, and in desperate cases, 14,000 more troops can be raised. Their intense love of independence, and heroism in the defence of their country, is worthy of the highest respect; but out of their own country, they are savage barbarians, who destroy with fire and sword everything they cannot carry off.

There is little trade in M., yet hides, wool, venison, dried and smoked fish, mutton and goat flesh, bacon, lard, &c., are exported in considerable quantities. These goods are carried to Cattaro by the women, aided occasionally by mules, for, owing to the absence of roads (a precaution against invasion), carts are unknown. Austrian and Turkish coins form the currency, as M. has no mint of its own.

*History.*—M. belonged in the middle ages to the great Servian kingdom, but after the dismemberment of the latter, and its conquest by the Turks at the battle of Kossovo (1389), the Montenegrins, under their prince, who was of the royal blood of Servia, maintained their independence, though compelled to relinquish the level tracts about Scutari, with their chief fortress of Zabllak, and confine themselves to the mountains (1495). In 1516, their last secular prince resigned his office, and transferred the government to the vladika. The Porte continued to assert its claim to M., and included it in the pashalik of Scutari; but the country was not conquered till 1714, and on the withdrawal of the Turks soon afterwards, it resumed its independence. In 1710, they had sought and obtained the protection of Russia, the czar agreeing to grant an annual subsidy on condition of their harassing the Turks by incursions, and this compact has, down to the present time, been faithfully observed by both parties. Another part of the agreement was, that the archbishop or vladika was to be consecrated by the czar. In 1796, the Prince-bishop, Pietro I., defeated the Pasha of Scutari, who had invaded M., with the loss of 30,000 men; and for the next quarter-century we hear no more of Turkish invasions. The Montenegrins rendered important aid to Russia in 1808 against the French in Dalmatia, and took a prominent part in the attack on Ragusa, the capture of Curzola, and other achievements. Pietro II., who ruled from 1830 to 1851, made great efforts to civilise his people, and improve their condition. He established the senate, introduced schools, and endeavored, though unsuccessfully, to put an end to internal feuds, and predatory expeditions into the neighboring provinces. Some Turkish districts having joined M., the Turks attacked the latter in 1832, but were repulsed. A dispute with Austria regarding the boundary resulted in a war, which was terminated by treaty in 1840. In 1851, the last prince-bishop died, and his successor, Danilo I., separated the religions from the secular supremacy, retaining the latter under the title of Gospodar. This step caused the Czar Nicholas to withdraw his subsidy (which was relieved, and the arrears paid, by the Czar Alexander II.), and the imposition of taxes thus rendered necessary, caused great confusion. This was taken advantage of by the Turks, who, under Omar Pasha, invaded the country; but the intervention of the Great Powers compelled a treaty, February 15, 1853. Danilo went in vain to the Paris conference in 1857, seeking the recognition of M. as independent. In 1860, the Montenegrins excited an insurrection against the Turkish rule in the Herzegovina, which was soon suppressed, and in return they were so hard pressed by the Turks, that they were glad to agree to a treaty (1863), by which the sovereignty of the Sublime Porte over M. was recognised. Fresh complications caused M. to declare war against Turkey in Jan. 1876, but a compromise was effected. M., however, supported the insurrection against Turkey that broke out in the Herzegovina a little later, and in July 1878 was again at war. The Montenegrins co-operated with the Russians against their hereditary enemy during the war of 1877—1878; and the Berlin Conference (1878) recognised the independence of M., and agreed to an important extension of Montenegrin territory.

**MONTENO'TTE**, a small village of Northern Italy, 26 miles west of Genoa, where the Austrians were defeated by the French on the 12th April 1796.

**MONTEPULCIA'NO**, a city of Italy in the province of Siena, situated on a high hill, 56 miles south-south-east of Florence. Pop. about 3000. Numerous Etruscan remains have been excavated in the neighborhood. The wines of M. are famous.

**MONTETERA'LE**, a town of S. Italy, in the province, and 14 m. n.w. of the town of Aquila. Pop. 5014. It stands on a hill in the midst of a vast plain, and has several elegant churches. There are vast chestnut-groves near M., which furnish the poor inhabitants with the chief article of their subsistence.

**MONTEREAU**, a town of France, in the department of Seine-et-Marne, at the confluence of the Seine and Yonne, 46 miles south-east of Paris, with which there is communications by steam-boat. The manufactures are earthenware and leather. Here, in 1419, Jean-sans-Peur, Duke of Burgundy, was assassinated, at the instigation and in the presence of the Dauphin, afterwards Charles VII.; and in the immediate vicinity, Napoleon, Feb. 18, 1814, gained his last victory over the allies. Pop. (1876) 6847.

**MONTREY'**, the most thriving city of Northern Mexico, capital of the state of Nuevo Leon, on the San Juan, a tributary of the Rio Grande, 175 miles west of Matamoros. It is well paved and clean, stands on a broad plain, 1626 feet above sea-level, and is surrounded by beautiful gardens and orchards. Pop. in 1869, 13,509. From its situation, its facilities for commerce are great; and it is the entrepôt for the transport of American goods from the Rio Grande to the inland states of Durango and Zacatecas. In the war between the United States and Mexico, M. capitulated, 24th September 1846, after a siege of four days, to the American forces under General Taylor.

**MONTE RO'SA**, the *Mons Sylvius* of the ancients, is the highest mountain in Europe after Mont Blanc. It is situated in the angle where the west end of the Pinnine meets the Lepontic Alps, and separates the canton of Valais from Italy. The northern portion of the mountain is highest, and forms nine peaks, the highest of which is forked and precipitous, and attains an altitude of 15,210 feet above sea-level. Many attempts were made to ascend this peak, but none were successful till 1855. The mountain appears to consist of mica-slate, in some places alternating with gneiss. It is rich in metallic ores, and several mines of gold, copper, and iron are worked. The highest mine is between 10,000 and 11,000 feet above sea-level, and in the region of perpetual snow. Rye ripens up to an elevation of 6000 feet; and the vine is found as far up as 8200 feet; but there is a difference of nearly 1000 feet in the altitude of the corresponding vegetation on the north and south side.

**MONTE SANT' ANGELO**, a city of Southern Italy, in the province of Foggia (formerly Capitanata), 28 miles north-east of Foggia. It stands on one of the Gargano group of hills, at a height of 2790 feet, and has numerous fine churches. It is famed for its exquisite honey, gathered from the odoriferous alpine plants of the mountain. Pop. 14,936.

**MONTE SAN GIULIA'NO**, a town of the island of Sicily, province of Trapani, situated on a high mountain 4 miles east-north-east of the town of Trapani. On the mountain (anciently *Eryx*) are the remains of a once famous temple of Venus. Pop. 6250.

**MONTE SA' RCHIO**, a town of Southern Italy, in the province of Benevento, 13 miles north-west of Avellino, on the torrent Corro. Pop. 5600.

**MONTESQUIEU**, Charles de Secondat, Baron de la Brède et de, one of the most celebrated authors and political philosophers of France, born 18th January, 1689, at his father's château of Brède, near Bordeaux, and descended from one of the most distinguished families of Guienne. In his youth he was a hard student of jurisprudence, literature, and philosophy. His love of the classical authors was so great, that at the age of twenty he composed a work intended to shew that they did not deserve eternal damnation for being pagans. In 1714, he was appointed a councillor of the parliament of Bordeaux, and two years after, president of the parliament. His first (published) work was his famous "*Lettres Persanes*" (Par. 1721), in which,

Monte  
Montfort

222

in the character of a Persian, he ridicules, with exquisite humor, and clear, sharp criticism, the religious, political, social, and literary life of his countrymen. Although he did not spare the Academy in these "Lettres," he was admitted a member of it in 1728, and would have been admitted sooner, if Cardinal Fleury had not objected on the ground of his jests against religion. In 1726 M. resigned his office in the parliament of Bordeaux, and spent some years in foreign countries. In England, he spent two years, during which he was much in the company of Lord Chesterfield, and was treated with the greatest respect by the most distinguished personages. After his return to Brède, he published his "Considérations sur les Causes de la Grandeur et de la Décadence des Romains" (Par. 1734), a masterly view of Roman history, expressed in a sententious, oracular, and vigorous style. It was followed, after a long interval, by his "Dialogues de Sylla et de Lysimaque" (Par. 1748), published under an assumed name, in which the motives and feelings of a despot are skilfully analysed. In the same year appeared his great work, on which he had been engaged for twenty years, the "Esprit des Loix" (2 vols. Geneva, 1748), in which it was attempted to exhibit the relation between the laws of different countries and their local and social circumstances. It was immensely popular. No fewer than twenty-two editions were published in eighteen months, and it was translated into various European languages. The "Esprit des Loix" is a wonderfully good book, considering the age in which it appeared. Without adopting Voltaire's hyperculegistic criticism, that "when the human race had lost their charters, Montesquieu rediscovered and restored them," it may be said that it was the first work in which the questions of civil liberty were ever treated in an enlightened and systematic manner, and to M., more than to any other man, is it owing that the science of politics has become a favorite subject of study with the educated public. M. died at Paris, 10th February 1755. The collective editions of his works are numerous, among which many be mentioned the complete and careful ones by Anger (8 vols. Par. 1819), by Destutt de Tracy and Villemain (8 vols. Par. 1827), by Lefebvre (2 vols. Par. 1839), and by Hachette (2 vols. 1865).

**MONTE VIDEO**, San Felipe de, the capital of the republic of Uruguay, in South America, is situated on the north shore of the estuary of the Rio de la Plata (which is here 60 miles wide), and 132 miles east-by-south from Buenos Ayres. It stands on a small peninsula, and is surrounded by a wall and fortifications. The houses are mostly of one story, with flat roofs. The only public buildings worthy of notice are the cathedral and the town-hall. The climate is healthy; but, as there are no rivers near the town, water is scarce, and it is only obtainable from wells, or by collecting rain-water in cisterns. The bay or harbor, which is about  $3\frac{1}{2}$  miles long by 2 broad, presents excellent facilities for building wharfs, docks, &c., is sheltered from all but the south-west gales, and averages 16 or 17 feet in depth. The trade of M. V. is extensive; the exports consisting of wool, hides, hair, tallow, salt and dried beef, bones, &c.; and the imports, of cotton and woollen fabrics, hardware, also flour, wine, spirits, and other provisions. The chief trade is with Great Britain. M. V. has steam communication with the United States, Rio Janeiro, Britain, and Genoa, and besides these, carries on a considerable trade with France, Spain, La Plata, and Italy. The population in 1862 (inclusive of the small suburbs of Cordon and Aguada) was 45,765; and in 1872, 105,296. In 1871, 1502 vessels, of 739,607 tons, entered and cleared from the port. The imports for 1875 amounted to about £3,300,000; and the exports to about £3,000,000. For the history of M. V., see URUGUAY.

**MONTEZUMA**, the name of two of the emperors of Mexico.—M. I., the most able of the Mexican emperors, ascended the throne about 1487, and soon after, commenced a war with the neighboring monarch of Chalco, which resulted in the annexation of that kingdom to Mexico. Tlatelolco, Cuixtlan, and Tzompahuacan were next annexed. Some reverses which his arms now suffered, led to a confederacy of the Tlascalans and two other powerful tribes against him; but in the war which followed, M.'s arms were again signally triumphant, and the territories of the conquered tribes increased the domain of the now all-powerful Montezuma. After several other successful wars, he died in 1471.—M. II., the last of the Mexican emperors, before its subjugation by the Spaniards, succeeded to the throne in 1502. He had distinguished himself as a warrior during the reign of his predecessor, and after his accession, carried the terror of his arms to the frontiers of Nicaragua and

Honduras. He was at the same time a member of the priestly order, and did not demit his functions on his accession. He devoted his chief attention to the improvement of the laws, and of the internal administration, and displayed his taste for pomp and luxury by the magnificence of his household arrangements, and a profuse embellishment of his capital. This necessitated heavy taxation, which, combined with the strictness of his administration, led to continual revolts among his subjects, especially those who had lately come under his sway. When Cortes landed in Mexico with his small army in 1519, M., blinded by an old prophecy, and by the strange appearance of the invaders, acknowledged them as beings of a superior order, and as his masters (see CORTES). The inhabitants of Mexico having risen against Cortes, the latter caused M., who was then his prisoner, to appear in order to pacify them; but being wounded accidentally by a stone flung from amongst the crowd of his own subjects, he so keenly felt the indignities which he had suffered, that he repeatedly tore the dressing from his wound, and soon after died, June 30, 1520. Some of his children adopted the Christian religion, and his eldest son received from Charles V. the title of Count of Montezuma. One of his descendants was viceroy of Mexico from 1697 to 1701. His last descendant, Don Marillio de Teruel, Count of Montezuma, was banished from Spain by Ferdinand VII., and afterwards from Mexico, on account of his liberal opinions, and died at New Orleans in 1836.

**MONTFERRAT**, formerly an independent duchy of Italy, between Piedmont, Milan, and Genoa, now forming part of the kingdom of Italy. It consisted of two separate portions, Casale and Acqui, lying between the Maritime Alps and the Po, and having an area of over 1800 square miles. The capital was Casale. M., after the downfall of the Frankish empire, was ruled by its own margraves till the beginning of the 14th century. This illustrious house for a long time disputed the sovereignty of Piedmont with the House of Savoy, and sent to the crusades more heroes than any other sovereign house in Europe. Members of the family ruled simultaneously in M., Thessaly, and Jerusalem. On the death of the Marquis John I. in 1205, his sister, Iolande or Irene, who was Empress of Constantinople, succeeded to M.; and her second son became the founder of the family of Montferrat-Palaeologus, which became extinct in 1533, and M. passed to the Gonzagas of Mantua. In 1631, the dukes of Savoy obtained possession of a portion of M., and in 1703, with the consent of the German Emperor, the remaining portion passed under their sway, and was incorporated with their own dominions.

**MONTFORT**, the name of a noble French house, descended, according to the most probable opinion, from Baldwin, Count of Flanders, and Judith, daughter of Charles the Bald. AMAURI 2d, Seigneur de Montfort (a little town between Paris and Chartres) is the first of the family mentioned in history. He lived in the first half of the 11th century. His son, SIMON 1st, had for his third wife Agnes, daughter of Richard Comte d'Evreux. He left four sons, of whom only AMAURI 4th had issue. The grandson of this Amauri, SIMON 3d, surnamed the *Bald*, Comte de Montfort and Evreux, married Amicie, daughter of Robert de Beaumont, Earl of Leicester. His second son was the famous SIMON 4th, Comte de Montfort, and Earl of Leicester, subsequently Comte de Toulouse. This nobleman, so conspicuous in the terrible crusade against the Albigenses (q. v.), was born about the year 1150. In 1193 he went to Palestine at the head of a troop of French knights, but failed in doing anything against the Saracens, and was obliged to return. In 1209 he joined the 4th crusade, which, however, had no religious design at all (see CRUSADES), in consequence of which M. abandoned it. In 1209 he took part in the war of extermination against the Albigenses. He signalled himself by his relentless ferocity, and his brilliant successes, but was killed by a stone at the siege of Toulouse, 25th June 1218.

**MONTFORT**, Simon de, Earl of Leicester, the fourth son of the preceding, was born in France about 1206. The title of Earl of Leicester came to him by his grandmother, Amicie de Beaumont, sister and heiress of Robert Earl of Leicester, but he did not directly or immediately inherit it, for, during the reign of King John, it was borne by Ranulf, Earl of Chester. Some time after the death of Ranulf, M. came to England, and offered his services to Henry III. Already he enjoyed a great reputation as a warrior, and Henry was so highly pleased with the young French noble,

that he conferred on him the title of Earl of Leicester. Little did Henry think that the stranger was to prove against himself a great founder and champion of English constitutional liberty. He married Elinor, sister to King Henry III., and the youthful widow of that Earl of Pembroke to whom, more than to any other, the people of England owe Magna Charta. After this marriage—which was viewed with disfavor by the king—De M. became a steadfast advocate of the English Charter, and of the liberties of the people. After visiting the East, he was sent by the king to undertake the command of Gascony. In 1257, the king's debts were so great, and the rapacity of his foreign relations so unbearable, that the people were in a state of insurrection. The barons assembled, and, under the direction of De M., held the celebrated parliament at Oxford. They passed statutes to enforce the provisions of Magna Charta. The king swore to observe them, but sent forthwith to the pope praying to be absolved from his oath. The bull of absolution arrived. Henry set his barons at defiance, shut himself up in the Tower, and appealed to Louis of France. England was now in arms. The whole middle class looked up to De M. as their champion and leader, and the war began with the battle of Northampton. The wars of the barons, under De M., have been superficially viewed but as the strife of turbulent nobles, who, in the absence of foreign warfare, employed themselves in getting up a contest at home. Later researches, however, have shown that but for the struggles of De M. and the barons, the concessions at Runnymede would have been a mere worthless parchment. At Lewes, the royal forces were signally defeated, and the king taken captive. A French chronicler, who praises De M. as "noble, chivalrous, and the ablest man of the age," expressly adds that he was "backed by the general favor of the people," who at this time were so "unspeakably trampled under foot, and deprived of all their liberties." The conditions exacted from the king were, that he should observe Magna Charta and the Charter of the Forests; be moderate in his expenses and grants, until his old debts were paid off, and he was enabled to live on his own property, without oppression of merchants or the poor; and that Englishmen only should be chosen counsellors. No new pretensions were introduced, even at this moment of triumph, and the constitutional maxim of respecting the person of the king was carefully upheld. The queen (Elinor of Provence), who was in France, now occupied herself in collecting a large army. To deliberate upon the measures to be adopted at this great crisis, writs were issued to the sheriffs, in 1265, by De M., directing them to return two knights for each county, and two citizens or burgesses for every city and borough; and from this time may be clearly dated the recognition of the Commons as an estate of the realm in parliament. Guardians had been appointed by the barons to watch over the execution of Magna Charta, but fifty years of encroachment on the part of the crown, convinced De M. that a stronger and more enduring security would be to commit the care of constitutional freedom thenceforth to the people themselves, whose interests the barons thus identified with their own. Mr Blaauw, who, in his "Barons' War," presents De M. almost for the first time in his true character, adds, that "it should be an honest pride to us in after-times that English liberty thus owes its birth to this noblest parentage, confidence in the people." A second war broke out, and this time the popular cause was weakened by defection and treachery. Prince Edward (afterwards Edward I.) encountered the barons at Evesham, with a greatly superior army. When defeat was inevitable, the great leader refused to flee. He "fought stoutly like a giant for the liberties of England," but fell, overwhelmed by numbers. The death of De M. filled the whole land with mourning. Like Cromwell, whose career in many respects resembles his own, he was deified a grave by the royalists, his head being sent to Wigmore Castle, and his mutilated limbs to different towns; but the people bewailed their dead champion, and the clergy pointed to his glorified spirit in heaven. The influence of De M. was felt after his death. No baron was executed for bearing arms against his sovereign, and although the Oxford Statutes were formally rescinded, their spirit remained. See "Life," by M. Crelighton (1876); and "Simon de Montfort" by Paull, translated by Una M. Goodwin (1876).

MONTGOLFIER, Jacques Etienne and Joseph Michael, two brothers, distinguished as the inventors of the first kind of Balloons (q. v.). They were the sons of a celebrated paper-manufacturer at Annonay, in the department of Ardèche, and early engaged themselves in the same branch of industry. Etienne, after a few unsuccessful experiments with the balloon, repaired to Paris; but though his discovery

created a great sensation, and was followed out in practice by many eminent men, he obtained little pecuniary aid in carrying on his experiments, and at length retired to his native town, where he resumed the manufacture of paper, and died at Servieres in 1799.—His elder brother, Joseph, the sharer of his labors and his glory, was a man of much genius and little education; but the two brothers were fitted to supplement each other's deficiencies, and together they made many discoveries, and were both received as members of the French Academy. Joseph invented the hydraulic screw, the calorimeter, &c., and in the latter part of his life filled a post in the department of Arts and Manufactures. He died at Paris in 1810.

MONTGOMERY, Gabriel, Comte de, a French knight of Scottish extraction, and an officer in the Scottish Lifeguard of the king of France, was born about 1530. At a tournament given, 30th June 1559, by Henry II. in honor of his daughter's marriage with Philip of Spain, the king insisted upon young M. entering the lists with him. M. reluctantly complied, and the shaft of his broken lance entering the king's visor at the eye, Henry II. was borne insensible from the ground, and so continued for eleven days, when he died. M., although blameless, left France, and soon after embraced Protestantism in England. On the commencement of the religious wars in 1562, he returned to his native country to support the Protestant cause, and defended Rouen with great bravery. In the third religious war, he was one of the leaders of the Protestants, and gained many advantages over the royalists in Languedoc and Bearn. During the massacre of St Bartholomew, he happened to be at Paris, and owed his escape to the swiftness of his horse, and fled to England. In April 1573, he appeared off Rochelle with a small fleet, but failed in accomplishing anything, and was obliged to retire. Next year, at the head of a band of Huguenots, he landed in Normandy, and commenced war there; but being compelled at last to surrender the castle of Domfront, he was carried to Paris; and although the general to whom he surrendered had assured him of his life, he was beheaded, after long imprisonment, 21th May 1574. Brantome describes him as naturally the most nonchalant and pleasure-loving of men, but that, when once he had mounted his saddle, there was not a more daring or vigilant warrior in all Christendom.

MONTGOMERY, James, a minor British poet, the son of a Moravian preacher, was born at Irvine, Ayrshire, November 4, 1771, and at the age of seven was sent too the Moravian settlement at Fulneck, near Leeds, in order to complete his education for the Moravian pastorate. At Fulneck, the course of study seems to have been to severe in its character for the young poet; the imaginative side of his mind was allowed no recognition, and it was only by stealth that he read Cowper's poems and "Robinson Crusoe." Much of his leisure time at school was employed in the composition of verses and of music, in which he took much delight. In 1789, he ran away, and, after four years of various employment, became engaged as clerk to Mr Galea, editor of "The Sheffield Register," for which he soon began to write political articles. In 1794, he commenced a newspaper of his own, "The Sheffield Iris," which he continued to edit till 1825, when he retired. During the period of his editorship, M. was twice subjected to fine and imprisonment, by government. In 1795, he was fined £20, and sentenced to three months' imprisonment, for printing off some copies of a miserable ballad in which government suspected that sedition lurked, and in 1796, he was fined £30, and imprisoned for six months, for giving an account of a Sheffield riot. He received a government pension of £150 in 1835, and he died at his own house in Sheffield, April 30, 1854. His principal works are—"The Wanderer of Switzerland" (1806); "The West Indies" (1809); "The World before the Flood" (1812); and "The Pelican Island, and other Poems" (1827). A collected edition of his minor poems appeared in 1851, and in 1853, his "Original Hymns for Public, Private, and Social Devotion," closed the series of his publications.

His poems are melodious, full of picturesque description, and the gentlest human feeling. The personages introduced in his poems are, however, only shadows, or touched with the faintest color of character. But he claims a well-defined position among the favorite poets of his country by several of his hymns and minor poems, and by his exquisite verses on Home, which commence the third part of "The West Indies."

MONTGOMERY, Robert, a preacher and verse-maker, who has gained notoriety, if not fame, was born at Bath in 1807. He graduated B.A. at Oxford in 1833, M.A.

Montgomery  
Monti

226

in 1833, and was ordained in 1835. In 1836, he became minister of Percy Street Episcopal Chapel, London; he afterwards removed to Glasgow, where he preached for four years, but returned to London, and resumed office at Percy Street Chapel in 1843. He died December 8, 1855. M.'s works comprise a large number of volumes in prose and verse, on themes more or less sacred. He is best known by his poems. "The Omnipresence of the Deity" (1828) has passed through 26 editions. But his celebrity may be said to have died with him, and his works have already become part of the lumber of libraries. This result has been brought about to some extent by the judgment which Macanlay passed upon "The Omnipresence" and other works by this author.

**MONTGOMERY**, a city and the capital of Alabama, United States, is on the left bank of the Alabama River, 415 miles above Mobile, at the head of steam-boat navigation. The city is very handsomely built, with elegant residences and gardens on a cluster of hills, on one of which is a handsome state-house. It has a law-school, several academies, fourteen churches, five banks, four papers, marble-works, iron-foundries, and is one of the largest cotton-marts in the state. M. is connected with four lines of railway. It became, in 1860, the capital of the Confederate States, and continued to be the seat of government until, on the secession of Virginia, it was removed to Richmond. Pop. in 1870, 10,583; 1880, 16,713.

**MONTGOMERYSHIRE**, an inland county of North Wales, between Shropshire on the e., and the Welsh counties, Merioneth and Cardigan, on the w. Area, 483,823 statute acres, of which only about 80,000 are under tillage; pop. (1871) 67,623. The surface is almost wholly mountainous, a large portion consisting of bleak elevated moorlands; but toward the English border, there are several warm, fertile, and well-wooded valleys. The Severn, the Vyrnwy, and the Dovey are the principal rivers. The county belongs almost entirely to the basin of the Severn. The mineral wealth of M. is not great, but copper, lead, and zinc are procured, and millstones, slates, and limestone are quarried. On the uplands, the soil is poor, and suited principally for mountain pasture; but in the valleys, grain and flax are raised. Cattle and sheep, and the pure breed of Welsh ponies called "Merlins," are reared. The Welsh-flannel manufacture is extensively carried on in the county. The capital is Montgomery; pop. (1871) 1255, from which the county received its name, and which was so called from Roger de Montgomery, Earl of Arundel and Shrewsbury, who, in 1093, recaptured the town and castle which had been wrested during the previous year by the Welsh from the founder, Baldwin, lieutenant of the Marches to William the Conqueror and William Rufus. The county sends one member to the House of Commons. The county business is carried on at Welshpool and Newtown alternately. There is an excellent trade in cattle and horses. Offa's Dyke traverses the south-east corner.

**MONTH**, originally the period of the moon's revolution round the earth. If this is reckoned from the position of the moon among the stars to her return to the same position, the period is called a *sidereal* month, and consists of 27 days, 7 hours, 43 minutes, 11½ seconds; but if from new moon to new moon, it is longer, being 29 days, 12 hours, 44 minutes, 3 seconds; this is called a *synodic* month (see Moon). The latter period forms one of the three natural measures of the lapse of time, and, notwithstanding that its efficiency depends on the state of the atmosphere, it ranks next to the day in importance. There are several other periods used by astronomers to which this name is applied, as the *tropical* or *periodic* month (27 days, 7 hours, 43 minutes, 47 seconds), reckoned from the moon's passing the equinox till her return to the same point; the *nodal* month (27 days, 5 hours, 5 minutes, 29 seconds), from ascending node to ascending node; the *anomalistic* month (27 days, 13 hours, 18 minutes, 37 seconds), from perigee to perigee; and the *solar* month, which is the twelfth part of a solar year, consisting of 80 days, 10 hours, 29 minutes, and 4 seconds. Distinct from all these is the *civil* or *calendar* month, fixed by law for ordinary purposes, and consisting of a fixed number of days—from 28 to 31—according to the particular month. The calendar months, with the number of days belonging to each, are given below.

See also the separate months under their own heads. The names by which the months are designated throughout Christendom were given them by the Romans; and though Charlemagne in the 9th c., and the French Directory in the end of last

century, attempted to substitute descriptive epithets, the old-established names continued to be preferred.

**MONTHOLON**, Charles Tristan de, *Comte*, afterwards *Marquis de*, descended from an ancient French family, was born at Paris, 1782. At the age of ten he entered the navy, but exchanged it for the army in 1798. His rise was rapid. He displayed great zeal on behalf of the First Consul in the revolution of the 18th Brumaire, in the capacity of *chef d'escadron*. He served in a number of campaigns, and was severely wounded at Wagram. Napoleon made him his chamberlain in 1809. He was made a general of brigade in 1814, and appointed to the chief command in the department of Loire. On Napoleon's abdication, M. remained in France, but held aloof from the Bourbons. No sooner had the Emperor escaped from Elba and landed at Frejus, than M. hastened to join him. He was present at Waterloo, and accompanied Napoleon to St Helena, continuing his devoted attentions to him till he breathed his last, and being named in his will as one of his trustees, spared no exertion to carry its provisions into effect. Along with General Gourgaud, he published “*Mémoires pour servir à l'histoire de France sous Napoléon, écrits à Ste.-Hélène sous sa dictée*” (8 vols. Par. 1823). He afterwards published a work entitled “*Récit de la Captivité de Ste.-Hélène*” (Lond. 1847). In the proclamations which Louis Napoleon issued on his landing at Boulogne in 1840, M. was named chief of his staff, and on this account he was condemned by the Chamber of Peers to 20 years' imprisonment; but he was afterwards pardoned. He died 21st August, 1853.

**MONTI**, Vincenzo, the great regenerator of modern Italian poetry, was born 19th February 1753, in the Roman province of Ferrara, and studied in the university of Ferrara. On the termination of his studies, he repaired to Rome (1778), where the patronage of friends obtained for him the post of secretary to the pope's nephew. During his abode in Rome, he became involved in a bitter squabble with Alfieri, whose fame as the master-tragedian of Italy was then high in the ascendant—a fact which may have been unpalatable to M., in consequence of the failure of his own dramatic attempts. The assassination of Basville, the republican envoy of France, afforded to M. a subject for his poem, “*La Basvilliana*.” His two succeeding poems, the “*Misogonia*” and the “*Feroniade*,” contained the bitterest invectives against France and Bonaparte; but on the appearance of a French army before Rome, M., with the inexcusable inconsistency which characterised his political conduct throughout, hastened to espouse the cause of France, and to invoke the protection of Bonaparte. M. was shortly after appointed secretary of the Cisalpine Directory; and in 1799 repaired to France, where he undertook the translation of Voltaire's poetical works. On returning to Italy, he was appointed professor in the university of Pavia; and in 1805, on Bonaparte being proclaimed king of Italy, M. was appointed state historiographer. On the fall of the Empire, M. became the eulogist of the Austrian possessors of his country. In the midst of all these political vicissitudes, he pursued with vigor his studies of the classics, and accomplished one of his greatest works, the translation of the “*Iliad*” into Italian verse. M. died at Milan, 13th October 1828, of an apoplectic stroke, and was sincerely lamented, notwithstanding the many opponents his hasty susceptibility had created in life. The best editions of his works are those of Milan (1825–1827, 8 vols.), and his “*Opere Inedite e Rare*” (Milan, 1832–1833, 5 vols.). M. had a warm admiration of Dante, and partook, in some degree, of the spirit of the great master. His chief works are distinguished by sustained grandeur of imagery and diction, by daring flights of imagination, and by the delicacy, elevation, and fire of the sentiments expressed. They are too numerous for separate notice, but the best of them rank among the noblest productions of Italian genius.

Monilla  
Montreal

228

**MONTILLA**, a town of Spain, in the modern province of Cordova, and 20 miles south-south-east of the city of that name. It stands on a hillside rising from the south bank of a tributary of the Xenil. Manufactures of coarse linen and earthenware are carried on, and oil-mills are in operation. A famous wine is grown in the vicinity. *M.* is the birthplace of Gonzalo de Cordova, the "Great Captain." Pop. 15,000.

**MONTJOIE ST DENIS**, the war-cry of the old kings of France, said to be as ancient as the days of Clovis, and from which the king-of-arms, Montjoie, who had exclusive jurisdiction in France, derived his title.

**MONTLUÇON**, a town of France, department of Allier, is picturesquely situated on a hill on the right bank of the Cher, 40 miles west-south-west of Moulins. It has some coarse cloth manufactures, and trade in corn, wine, and fruits. It has also iron-works and plate-glass manufactories. Pop. (1876) 21,904. At a distance of 10 miles are the wells of Nèris-les-Bains, celebrated in the time of the Romans—of whom many traces are left—and still much frequented by invalids.

**MONTMARTRE**. See **PARIS**.

**MONTMORENCY**, Anne, first Duc de, Marshal and Constable of France, born March 1493, belonged to one of the oldest and greatest of the noble families of France. He received, it is said, the name of *Anne* from his godmother, Anne of Brittany. He distinguished himself by his gallantry and military skill in the wars between Francis I. and the Emperor Charles V., and was taken prisoner along with his sovereign in the battle of Pavia, which was fought against his advice. He afterwards became the leader of the French government, shewing great ability in matters of finance and diplomacy, and was made Constable in 1533; but his rough manners made him an object of dislike to many; and the suspicions of the king having been aroused against him, he was suddenly banished from court in 1541, and passed ten years on his estates, till the accession of Henry II., when he came again to the head of affairs. In 1557, he commanded the French army which suffered the terrible defeat of St Quentin, in which he was taken prisoner. During the minority of Charles IX., *M.*, with the Duke of Guise and the Marshal St André, composed the famous triumvirate which resisted Catharine de' Medici. In 1562 and 1567, he commanded the royal army against the Huguenots, and in both wars gained victories over them, but received a fatal wound at St Denis, and died at Paris on the following day, 12th November 1567.

**MONTMORENCY**, Henri, second Duc de, grandson of the famous Constable de Montmorency, born at Chantilly, 30th April 1593. His godfather was the great *Henri Quatre*, who always called him his "son." When he was 17 years of age, Louis XIII. made him Admiral, and he defeated the Huguenots in Languedoc, and took the Isle of Ré from those of Rochelle. He afterwards gained other victories over them, and in 1680 received the chief command of the French troops in Piedmont, where he defeated the Spaniards, for which he received a marshal's baton. Unhappily for himself he ventured to oppose Richelieu, who had always been his enemy, and espoused the cause of Gaston, Duke of Orleans; for this he was declared guilty of high treason, and Marshal Schomberg being sent against him, defeated him at Castelnaudary, and took him prisoner. *M.*, although almost mortally wounded, was carried to Toulouse, sentenced to death by the parliament, and notwithstanding his expressions of penitence, and the most powerful intercession made for him—for example, by King Charles I. of England, the pope, the Venetian Republic, and the Duke of Savoy—was beheaded, 30th October 1632. *M.* was distinguished for his amiability and the courtesy of his manners, as well as for his valor.

**MONTORO**, a town of South Italy, in the province of Avellino, built partly on the slope and partly around the base of a hill, 13 miles north of Salerno. Pop. 4721. It forms the central point of several villages, and has large markets and some linen and cloth manufactures.

**MONTORO**, a pleasant town of Spain, in the modern province of Cordova, built on a rocky ridge around which winds the Guadalquivir, 26 miles east-north-east of Cordova. It contains one of the best hospitals in Andalusia. Hardly any drinkable water can be obtained within the town. The heights in the vicinity are clothed

with olive plantations, and oil is largely exported from this quarter. Woollens and earthenware are manufactured. Pop. 10,500.

**MONTPE'LIER**, the capital of Vermont, United States of America, is on the Winooski River, 215 miles north-north-west of Boston. It is a picturesque village, with a handsome state-house, 7 churches, 2 banks, 4 newspapers, iron foundry, flour-mills, and manufactures of carriages, hats, lumber, &c. Pop. (1880) 3219.

**MONTPELLIER** (Lat. *Mons peesulanus* or *puellarum*), a city of France, in the department of Hérault, in 43° 36' n. lat., and 3° 50' e. long. Pop. (1876) of the town alone, 51,838. Seen from a distance, M. has an imposing appearance, from the number of its towers, steeples, and cupolas; but although its suburbs are clean and well built, the interior of the old town disappoints expectation, being chiefly remarkable for its crooked, dark, narrow, and dirty streets. The public walks, known as those of the Peyron, and some of the other more elevated points, afford glorious views, embracing the Mediterranean, the Alps, the Cevennes, and the Pyrenees. The most noteworthy buildings are the cathedral, the theatre, the exchange, the Hall of Justice, the prefecture, the observatory, and the university. The last, which was founded in 1196, is composed of three faculties—that of medicine, founded in the 12th c. by Arabian physicians, and still ranking among the best in Europe—that of the exact, and that of the physical sciences. M. has a botanical garden, the oldest in Europe; a public library of 50,000 volumes, and a pharmaceutical school; admirable museums, natural history and fine art collections, &c. The industrial products of M. are pigments and other chemical preparations, brandy, liquors, perfumes, soap, corks, sugar, cotton, woollen, and fine leather goods; and the trade, which is very important, includes, besides these articles, wine, seeds, olive-oil, and fruits. Railways to Marseille, Pette, and other ports, besides various canals, facilitate commercial and social intercourse, and few cities of the empire hold out greater attractions in regard to intellectual culture than Montpellier. Its geographical position has led to its being selected as a place of residence for consumptive patients; but the extreme clearness, and even sharpness of the air in the more elevated parts of the town, the occasional occurrence of the icy wind known as the *Mistral*, and the sudden accession of overpowering heats, would seem very materially to counteract some of its long reputed advantages.

**MONTREAL**, the largest city of Lower Canada and of British America, lies in lat. 45° 31' n., long. 73° 35' w., on the left bank of the St Lawrence, 180 miles above Quebec, and 200 below Lake Ontario, 400 from New York, and 2750 from Liverpool. Its eastern suburb, which is now an incorporated village, called Hochelaga, was originally the site of an Indian village of the same name, discovered in September 1535 by Jacques Cartier; and it is from his admiring exclamation at the view obtained from the neighboring hill, that M. (corrupted from Mont Royal) derives its name. The westernmost permanent settlement which the French obtained in Canada, it was under them merely an outpost of Quebec, and continued to be such under British rule till 1832, when it became a separate port. Since then, the rapidity of its progress has been astonishing. By the deepening of the shallower parts of the river above Quebec, M. is now accessible to vessels of over 3000 tons burden, and drawing from 19 to 22 feet. Its harbor, lined with wharfs for a mile and a quarter, at which 125 ships could lie at one time, is, from its inland position (90 miles above the influence of the tides), perfectly safe. Situated at the head of the ocean-navigation of the St Lawrence, M. has naturally become the dépôt for the exports and imports of all the Canadas. At the same time, the obstruction to vessels sailing further up the river, caused by the rapids, has been surmounted by magnificent canals. The canals connecting M. with Lake Ontario have locks of 200 feet by 45, with 9 feet of water on the sills; the locks of the Welland Canal are rather smaller. As M. lies also near the confluence of the Ottawa and St Lawrence, it is in immediate connection with the vast lumber-country adjoining the former river and its tributaries; while a canal has been projected to connect the Ottawa, through Lake Nipissing, with the Georgian Bay in Lake Huron, which, if carried out, will probably bring the produce of the north-western states, as well as of Western Canada, through M., as it would give them an outlet to the ocean between 200 and 300 miles shorter than by the Erie Canal. But even at present, while navigation is open, an extensive daily

Montreal  
Montrose

230

traffic is carried on, by steamers and sailing-vessels of every description, with Lake Ontario and the Ottawa district, as well as with the Lower St Lawrence; and the ships of the Montreal Ocean Steam-ship Company, by aid of a subsidy from the Canadian government, keep up a weekly communication with Liverpool, while at the same time the harbor is constantly crowded with vessels from other foreign ports. After the navigation of the St Lawrence is closed, the ocean steamers find a harbor at Portland, Maine, which is connected with M. by a railway of 292 miles. This line belongs to the Grand Trunk Railway Company, and crosses the St Lawrence at M. by the celebrated tubular Victoria Bridge, the length of which, including its two abutments and 24 piers, is above a mile and three-quarters. By the lines of the same company, M. has railway communication with Upper Canada, the western states, and Lower Canada, while the Intercolonial Railway opens up communication with Halifax and St John. Several other lines afford direct communication with all the important cities and towns in New York state and the states of New England. The position, therefore, of M. as a centre of commerce is perhaps unequalled, and its rapid advance in consequence has placed it, within the last few years, among the first commercial cities of the American continent—second perhaps only to New York. Its exports, imports, and duties collected during the four years previous to 1862 were as follows: 1853—exports, £684,538; imports, £2,450,515; duty collected, £334,768. 1859—exports, £608,952; imports, £3,110,714; duty collected, £467,248. 1860—exports, £1,204,143; imports, £3,066,809; duty collected, £490,770. 1861—exports, £2,083,147; imports, £3,239,515; duty collected, £478,695. For the year ending June 30, 1870, these items had attained the following greatly increased proportions: Exports, £3,979,252; imports, £5,350,169; duty collected, £860,000. In 1873, the value of exports was £4,935,527; of imports, £11,064,139. The value of assessed property in 1873 was £12,712,230; in 1857 it was only £4,609,097. The population has risen in like manner. In 1840, it was about 27,297; in 1852, it was 57,716; in 1854, about 65,000; in 1861, 90,323; and in 1871, 167,325. The number of sea-going vessels arriving in the port of M. in 1873 was 422; in 1856, the number of sea-going vessels was only 232. The harbor is open on an average about eight months, from the latter half of April to the beginning of December.

The most conspicuous building in M., which is perhaps also the finest church on the continent of America, is the Roman Catholic cathedral. Built in the Gothic style of the 13th century, it comprises seven chapels and nine aisles, and can accommodate between 6000 and 7000 people. It has six towers, of which the three on the main front are 220 feet in height; and its chief window is 64 feet high, and 32 broad. There are several other Roman Catholic churches belonging to the order of St Sulpice, to whose members chiefly M. owes its foundation, and who still hold the seignory of the island on which the city is built. Adjoining the cathedral, is the seminary of St Sulpice, to which a large addition has been built within the last few years at a cost of £5000. The city contains also some of the largest conventual establishments in the world. The general wealth, indeed, of the Roman Catholic Church in M. has grown enormous in consequence of the increased value of the property given to it during the early settlements of the French. The Church of England has recently erected, at an expense of above £20,000, a new cathedral, which is very chaste in style, though somewhat small for a metropolitan see. St Andrew's Church, the most important belonging to the Church of Scotland, is also a very chaste specimen of Gothic architecture, and cost about £10,000. At about the same cost, the Methodists have built a handsome church in the florid Gothic style. Besides the Roman Catholic college in College Street, St Mary's College of the Jesuits, and a Baptist college, M. possesses an important university under the name of McGill College. Founded by a bequest of the Hon. James McGill in 1811, erected into a university by royal charter in 1821, and reorganised by an amended charter in 1852, it has now, besides its principal, the distinguished naturalist, Dr Dawson, a staff of 29 professors, and has an attendance of upwards of 300 students. M. is supplied with water by magnificent works, which cost about £120,000. The water is brought from the St Lawrence above the Lachine Rapids by an aqueduct five miles long to a pond, from which it is forced up by power derived from part of its surplus waters into reservoirs capable of containing 20 millions of gallons, and situated 200 feet above the level of the river. Along the side of the

"Mountain," there is a line of mansions, which command the view that astonished J. Cartier, and which may compare with the suburban mansions of the wealthiest cities in Europe or America. M. returns three members to the provincial parliament.

**MONTREAL**, the large and fertile island on which the city of the same name is built, is 30 miles long, 10 miles at its greatest breadth, and contains 197 square miles. Formed by the separation of the two channels by which the Ottawa issues into the St Lawrence, its surface, except at Mount Royal, is only diversified by gentle undulations, which run from north-east to south-west, and are named *Coteaux*. The island forms a county, divided into two ridings, the East, or *Hochelaga*, and the West, or *Jacques Cartier*, each of which returns a member to the provincial parliament.

**MONTROSE**, a royal and parliamentary burgh and seaport on the north-east coast of Scotland, in the county of Forfar, and situated at the mouth of the river South Esk, about 80 miles north-east of Edinburgh, and 40 miles south of Aberdeen. It stands on a level peninsula between the basin of the Esk (an expanse 7 miles in circumference, and dry at low water) and the mouth of the river. A fine suspension-bridge, 432 feet long and 26 feet broad—erected in 1828—1829 at a cost of nearly £30,000—connects the town with Rossie Island, which is again connected with the mainland by a small draw-bridge. The Royal Lunatic Asylum, opened in 1868 at a cost of upwards of £30,000, accommodates about 400 patients. Between the town and the shore are the "Links" or downs, among the finest in Scotland for golfing or cricketing. The harbor affords excellent accommodation to vessels of large tonnage, there being 18 feet of water on the bar at low-water of spring-tides, and is one of the best on the east coast. Two lighthouses stand in a line on the north bank of the river, about 400 yards apart; while a magnificent tower, named the Scurdyness Lighthouse, erected by the Board of Trade in 1870 at a cost of nearly £2700—exhibiting a clear white light, visible at nearly 20 miles distance—stands at the mouth of the river. Flax-spinning is the chief manufacture in the town, there being 4 factories of about 500 horse-power in the aggregate, employing upwards of 2000 hands, at a weekly cost of about £1500. There is also a large saw-mill, giving employment to nearly 300 men and boys. Ship and boat building, formerly a staple trade of the town, has greatly fallen off. Education is well represented in the town—the chief institution being the academy. In 1875, 1751 vessels, of 108,773 tons, entered and cleared the port. Imports—coal, lime, slate, iron, flax, and manures; exports—manufactured goods, salmon, herring, dressed wood, and agricultural produce. In 1875, the total value of trade was £404,453. Pop. (1871) 15,720. M. unites with Arbroath, Brechin, Forfar, and Bervie to send a member to parliament.

**MONTROSE**, James Graham, first Marquis of, belonged to a family that can be traced back to the year 1128. Its first notable member was SIR JOHN GRAEME of Dundaff, who fell at the battle of Falkirk, 22d July 1298. Early in the 15th c., Sir William Graham married for his second wife a daughter of Robert III. ROBERT, the eldest son of this marriage, was ancestor of the Grahams of Claverhouse. The third Lord Graham, created Earl of Montrose by James IV., fell at Flodden; his eldest son at Pinkie. The next in succession became vicaroy of Scotland after James VI. had ascended the throne of England. His eldest son, John, who succeeded to the earldom in 1616, married Lady Margaret Ruthven, eldest daughter of William, first Earl of Gowrie, and sister of the unfortunate nobleman who gives name to the *Gowrie Conspiracy*. The issue of this union was five daughters and one son, James, the "great Marquis," who was born in 1612, according to tradition, in the town of Montrose. His mother died in 1618, his father in 1626. In the following year, the boy was sent to the university of St Andrews by his guardian and brother-in-law, Archibald, Lord Napier, son of the famous inventor of logarithms. He was an apt, if not an ardent student, and during the two or three sessions of his attendance at college, acquired a very respectable amount of classical knowledge, besides exhibiting a genuine predilection for literature, which the stormy character of his after-life never quite destroyed. In his 17th year, he married Magdalene Carnegie, daughter of Lord Carnegie of Kinnaird, on which occasion he had his portrait painted by Jameson, the pupil of Van Dyck. For the next three years he lived

quietly at Klunald Castle, pursuing his studies. On attaining his majority, he left Scotland, to travel on the continent, visited the academies of France and Italy, and perfected himself in all the accomplishments becoming a gentleman and a soldier. On his return, he was introduced to King Charles I., but owing, it is said, to the machinations of the Marquis of Hamilton, was coldly received by that monarch, and had no sooner reached Scotland, than he joined the ranks of the king's opponents, which at this period comprehended the majority of Scotchmen. M. came back in the very year (1637) when the tumults broke out in Edinburgh on the attempt to introduce the Prayer-Book. Whether his conduct at this moment was the result of chagrin, or whether he was carried away by the prevailing enthusiasm, or by the persuasions of craftier persons than himself, is difficult to say. Baillie speaks of his having been "brought in" by "the *canniness* of Rother," a phrase which appears to Mr Mark Napier to indicate that he was trepanned with difficulty into joining the League. At anyrate, the youthful nobleman soon became to appearance one of the most zealous of the Covenanting lords. He was one of the four noblemen selected to compose the "Table" of the nobility, which, along with the other Tables of the gentry, of the burghs, and of the ministers, drew up the famous National Covenant (see COVENANTS), sworn to by all ranks at Edinburgh in the spring of 1638. M. was appointed in the following summer to agitate for subscriptions in Aberdeenshire, where the influence of the Marquis of Huntly was exercised on the side of the king. He did not, however, meet with great success. In 1639, he made three military expeditions to Aberdeenshire to overawe the royalists. The latter were in considerable force under the Marquis of Huntly, but owing to the timid, if not treacherous orders of the Marquis of Hamilton, then governor of Scotland, they were always forced to disband. M. twice took the city of Aberdeen. On the first occasion (29th March), he compelled the inhabitants to subscribe the Covenant, but did no injury to the city. His "too great" humanity is even lamented by Baillie. On the second (25th May), he imposed on the city a fine of 10,000 merks; but though his soldiers pillaged the place, he honourably resisted the importunities of the zealots among the Presbyterian clergy, who wished to expose it to the horrors of conflagration. Baillie again complains of his "too great lenity in sparing the enemy's houses." The arrival at Aberdeen by sea of the Earl of Aboyne—Charles's lieutenant of the north—with some reinforcements, induced M. to retreat, who was followed by the earl and the Gordon Highlanders. At Meagra Hill, near Stonehaven, a battle was fought (15th June) between the two armies, in which M. obtained a complete victory; four days later, he was again master of Aberdeen, after a fierce struggle at the passage of the Dee. The citizens were stricken with alarm, expecting some bloody punishment for their well-known Episcopalian leanings, but M. agreeably disappointed their fears. At a subsequent period, he was upbraided by the Committee of Estates for not having burned the town on this occasion. News of "the pacification of Berwick" now arrived in Aberdeen, and terminated the struggle in the north. Charles invited several of the Covenanting nobles to meet him at Berwick, where he was then holding his court, and to consult with him about Scottish affairs. Among those who went was M., and the Presbyterians dated what they regarded as his apostasy from that interview. Be that as it may, his political position was certainly different after his return. In the General Assembly which met, August 13, 1639, under the presidency of the Earl of Traquair, as royal commissioner, he shewed symptoms of disaffection towards the Covenant, and was the object of much popular obloquy. One night he is said to have found affixed upon his chamber-door a paper bearing these words, *Invictus armis, verbis vincitur*. The dissolution of the parliament, in June 1640, led to an open rupture between the king and the Covenanters, and both parties prepared to decide their quarrel by force of arms. The former assembled at York an army of 21,000 horse and foot; the latter another of 28,000, which, under the command of Leslie, crossed the Tweed, 21st August 1640. M. was the first man that forded the stream. The successes of the Scots, as is well known, soon forced Charles to summon a new parliament for the settlement of the national grievances. Meanwhile M., along with several other influential nobles, had entered into a secret engagement at Cumbernauld, for the purpose of frustrating what they regarded as the factious designs of the extreme Covenanting leaders. His conduct in England, too, had been suspicious. It was accidentally discovered that he had been secretly communicating with the king; and when the parliament assembled

(November 1640), he was cited to appear before a committee. The affair of the *Cum-bernauld Bond*, discovered by the ingenuity of Argyle, was brought up; but M. defended his conduct and that of his colleagues; and nothing came of it, though some fiery spirits among the clergy, says Guthrie, "pressed that their lives might go for it." In the following June, M. and some others were accused of plotting against Argyle, and were confined in Edinburgh Castle, where they remained till the beginning of 1642, when they were set at liberty in return for the concessions which Charles had made in Scottish subjects. Although they had been frequently examined, nothing definite had been proved against them. The accusation that M. had offered to the king to assassinate Argyle, is not historically substantiated, and is intrinsically improbable. During the next two or three years, he kept aloof, outwardly, from public affairs, but he had finally broken with the Covenanters, and had privately ranged himself on the side of the king. The civil war in England had now broken out, and was being carried on with dubious success. Charles and his advisers resolved to crush the Presbyterian leaders in Scotland, who were abetting the efforts of the English Parliamentarians. In the spring of 1644, M. now raised to the rank of marquiss, left Oxford, where he had been residing with his sovereign, and proceeded to Scotland to raise the royalists in the north. The battle of Marston Moor for a moment paralysed him, but his resolution speedily returned. He threw himself into the Highlands, and after skulking about the hills for some time in disguise, met at Blair-Athol some Irish auxiliaries and a body of Highlanders under Alister Maccolli Keitach Macdonald, better known as *Colkitto*, who had forced their way thither from the Western Isles in hopes of joining him. M. instantly placed himself at their head, and the clans quickly rallied round his standard. Marching south, he fell suddenly (1st September) on the Covenanting army commanded by Lord Elcho, at Tippermuir, near Perth, and gained a complete victory. Not a single royalist was slain. The same night, M. entered Perth, where he remained for three days, levying a fine of 9000 merks on the inhabitants. He then set out for the north, defeated a force of Covenanters under Lord Burleigh at Aberdeen (September 13), and took possession of the city, which was abandoned for four days to all the horrors of war. The approach of Argyle, at the head of 4000 men, compelled M., whose forces were far inferior in numbers and discipline, to retreat. He now plunged into the wilds of Badenoch, recrossed the Grampians, and suddenly appeared in Angus, where he wasted the estates of more than one Covenanting nobleman. Having obtained fresh supplies, he once more returned to Aberdeenshire, with the view of raising the Gordons, narrowly escaped defeat at Fyvie in the end of October, and again withdrew into the fastnesses of the mountains. Argyle, baffled in all his attempts to capture or crush M., returned to Edinburgh, and threw up his commission. His opponent, receiving large accessions from the Highland clans, planned a winter campaign, marched south-westward into the country of the Campbells, devastated it frightfully, drove Argyle himself from his castle at Inverary, and then wheeled north, intending to attack Inverness, where the Covenanters were posted in strong force under the Earl of Seaforth. The "Estates" at Edinburgh were greatly alarmed, and raising a fresh army, placed it under the command of General Baillie, a natural son of Sir William Baillie of Lamington. After consulting with Argyle, it was arranged that he should proceed by way of Perth, and take M. in front, while Argyle should rally his vast array of vassals, and attack him in the rear. The royalist leader was in the great glen of Albin—the basin of the Caledonian Canal—on his way to Inverness, when he heard that Argyle was following him. He instantly turned on his pursuer, fell upon him unexpectedly at Inverlochy, February 2, 1646, and utterly routed his forces. Fifteen hundred of the Campbells were slain and only four of M.'s men. He then resumed his march northwards, but did not venture to assault Inverness—his wild mountaineers being admirably fitted for rapid irregular warfare, but not for the slow work of beleaguering. Directing his course to the east, he passed—with fire and sword—through Elgin and Banff into Aberdeenshire, which suffered a similar fate. Baillie, and his lieutenant, Hurry, were at Brechin, but M., by a dexterous movement, eluded them, captured and pillaged the city of Dundee (April 3), and escaped safely into the Grampians. On the 4th of May, he attacked and routed Hurry at Aldern, near Nairn; and after enjoying a short respite with his fierce veterans in Badenoch, again issued from his wilds, and

inflicted a still more disastrous defeat on Baillie himself at Alford, in Aberdeenshire (July 2). There was now nothing to prevent his march south, and about the end of the month, he set out with a force of from 5000 to 6000 men. He was followed by Baillie, who picked up reinforcements on his way, and on the 15th of August again risked a battle at Kilsyth, but was defeated with frightful loss—6000 of the Covenanters being slain. The cause of Charles was for the moment triumphant; M. was virtually master of the country. The king formally appointed him lieutenant-governor of Scotland, and commander-in-chief of the royal forces. All the principal cities in the west hastened to proclaim their fidelity, and laid the blame of the recent troubles on the unfortunate Presbyterian clergy. But affairs soon took a very different turn. Great numbers of the Highlanders returned home—we might even say, deserted—burdened with multifarious plunder; and the Earl of Aboyne withdrew with all his cavalry. M.'s position in a district teeming with enemies, was growing critical, and on the 4th of September he broke up his camp at Bothwell and marched for the eastern counties, where Charles had informed him that the Earls of Traquair, Home and Roxburgh were ready to join him. In this he was disappointed, and on the 18th of the same month he was surprised at Philiphaugh, near Selkirk, by David Leslie, who fell upon the relics of M.'s army and his raw levies with 6000 cavalry—the flower of the Scottish forces then serving in England—who had been hurriedly despatched home on the news of M.'s startling successes. Leslie completely annihilated his opponent. "On Philiphaugh," says Sir W. Scott, "M. lost the fruit of six splendid victories." Escaping from the field of battle, he made his way to Athol, and again endeavored, but in vain, to rouse the Highlands; and at last Charles, now beginning to get the worst of it in the civil war, was induced to order him to withdraw from the kingdom. On the 3d of September 1646, he sailed for Norway, whence he proceeded to Paris. Here he endeavored, but in vain, to induce Henrietta Maria to bestir herself on behalf of her husband. The queen coldly received all his suggestions, and at last M., in despair, betook himself to Germany, in hope of service under the emperor, but soon after returned to Holland and entered into communications with the Prince of Wales, afterwards Charles II. It was here that news of Charles I.'s execution reached him. M. fainted on receipt of the dreadful intelligence, and gave way to the most passionate regrets. Charles II. now re-invested him with the dignity of lieutenant-governor of Scotland, and M. undertook a fresh invasion on behalf of the exiled monarch. In March 1650, he arrived at the Orkneys with a small force, and after the lapse of three weeks proceeded to Caithness; but neither the gentlemen nor the commons would rise at his call. He forced his way as far south as the borders of Ross-shire, where his dispirited troops were attacked and cut to pieces at a place called Corbiesdale, near the pass of Invercarron, by a powerful body of cavalry under Colonel Strachan. M. fled into the wilds of Assynt, where he was nearly starved to death, when he fell into the hands of M'Leod of Assynt, who delivered him up to General Leslie, by whom he was brought to Edinburgh. Condemned to death as a traitor to the Covenant, he was executed 21st May 1650. His demeanor in his last moments was very noble and dignified.

**MONTSEERRA'T**, one of the Lesser Antilles, belonging to Britain, lies 43 miles north-west of Guadeloupe, and at a similar distance from Antigua and St Kitts. It is about 11 miles in length, 7 in breadth, and contains an area of 47 English square miles. The population in 1871 was 8693, the females exceeding the males by 737. About two-thirds of the surface is mountainous and barren, the rest is well cultivated. The chief products are sugar, limes, rum, and molasses; but cotton, arrow-root, and tamarinds are also exported. The island forms a portion of the government of the Leeward Isles, and is directly ruled by a president, aided by a council and house of assembly. The chief town is Plymouth, on the south coast. The revenue of M. in 1874 amounted to £4648, and the expenditure to £5093. In 1873, the tonnage of vessels which entered and cleared its port was 13,213; and the total values of imports and exports in 1874 were respectively £23,938 and £38,079.

**MONTSEKRAT** (Lat. *Mons Serratus*, so named from having jagged ridges like the teeth of a saw), a mountain of Catalonia, in the north-east of Spain, about 30 miles from Barcelona. Its height is 3919 feet. "Its outline," says Ford ("Handbook for Spain," vol. i. p. 419), "is most fantastic, consisting of cones, pyramids, battresses, nine-pins, sugar-loaves, which are here jumbled by nature in a sportive mood." The pious Catalonians aver that it was thus riven and shattered at the

**Crucifixion.** Every rift and gorge is filled with box-trees, ivy, and other evergreens. From the topmost height the eye wanders over all Catalonia, and from the sea the ridge looks like an immense wall with seven pyramidal peaks. The mountain, however, owes its celebrity not to its extraordinary appearance, but to the Benedictine Abbey built upon it, at an elevation of 1200 feet, and to the 13 hermitages formerly perched like eagles' nests on almost inaccessible pinnacles. In 1811, the French, under Suchet, plundered the abbey, burned the library, shot the hermits, and hung the monks (who had given shelter to their emigrant brethren at the Revolution). The place suffered still more in 1827, when it became the stronghold of the Carlist insurrection.

**MONUMENT** (Lat. *monumentum*, from *monere*, to remind), anything durable made or erected to perpetuate the memory of persons or events. The chief kinds of monuments are described under their special names. See CAIRN; CHROMLECH; SEPULCHREAL MOUNDS; PILLAR; OBELISK; PYRAMID; ARCH; TRIUMPHAL; BRASSES; TOMB; STUPA; MAUSOLEUM, &c.

**MONZA** (anc. *Medætia*), chief town of a district in the province of Milan, stands on the river Lambro, 10 miles north-north-east of Milan, with which it is connected by railway. Pop. (1872) 16,000. It is essentially a town of Lombard growth, and under the Lombard sovereigns was capital of their kingdom. It owes much of its early importance, and its chief public edifices, to Theodolinda, the great queen of the Lombard dynasty. In the middle ages, M. was conspicuous for the wealth of its numerous citizens and nobles, and the extent of its cloth-trade. It has undergone 32 sieges. The cathedral, founded in the 6th c. by Theodolinda, contains many interesting memorials of this great queen. The famous Iron Crown (q. v.) and regalia of Lombardy, employed at the coronation of the German emperors as kings of Italy, were removed from Lombardy by the Austrians in 1859, on the cession of that province to France. The town has a good gymnasium, a theatre, two hospitals, and a philharmonic institution. Its present manufactures of cottons, hats, and preserved meats are daily increasing. M. is surrounded by an exuberantly fertile district, which yields abundance of grain, fruits, wine, and silk, and possesses great beauty of scenery and climate.

**MOON**, The, the satellite of the earth, revolving round the earth from west to east in a period of one *Month* (q. v.), and in consequence accompanying the earth in its motion round the sun. As the moon, to an observer on the earth, advances more than  $13^{\circ}$  to the east daily, whilst the corresponding advance of the sun is barely  $1^{\circ}$ , her progress among the stars is much more notable than that of the latter. This rapid angular motion, the continual and regular variation of her illuminated surface, and her large apparent size (being nearly equal to that of the sun), have rendered the moon an object of general interest; while her importance as the principal nocturnal substitute for the sun, and her special value to navigators and geographers, in the determination of longitudes (see LATITUDE and LONGITUDE), have rendered the *lunar theory* the object of the most thorough and careful investigation.

*Phases of the Moon.*—The first peculiarity about the moon that strikes a casual observer, is the constant and regular change of her illuminated surface from a thin crescent to a circle, and *vice versa*, and a corresponding change in the time of her appearance above the horizon. These changes depend upon the position of the moon relative to the earth and the sun, for it is only the half of the moon facing the sun that is illuminated by his rays, and the whole of this illuminated portion can only be seen from the earth when the sun, earth, and moon are in a straight line (the line of *syzygies*), and the earth is between the sun and moon. When the moon is in the line of syzygies, but between the earth and the sun, no part of her illuminated disc can be seen from the earth. In the former case, the moon is said to be *full*, and in the latter, *new*. A few hours after "new moon," the moon appears a little to the east of the sun as a thin crescent, with the horns pointing towards the east, and as she increases her angular distance from the sun at the rate of about  $12^{\circ}$  daily, the crescent of light becomes broader, till, after the lapse of a little more than seven days, at which time she is  $90^{\circ}$  in advance of the sun, she presents the appearance of a semicircle of light. The moon is then said to have completed her *first quarter*. Continuing her course, she becomes "Gibbous" (q. v.); and at the 15th or 16th day from new moon,

attains a position  $180^\circ$  in advance of the sun, and now presents the appearance known as *full moon*. From this point she begins to approach the sun, again appearing gibbous, and after a third period of more than seven days, reaches a point  $90^\circ$  west of him, and enters her *last quarter*. Here, again, she appears as a semicircle of light, the illuminated portion being that which was not illuminated at the end of the first quarter. The moon now rapidly approaching the sun, resumes the crescent form, but this time with the horns pointing *westward*, the crescent becoming thinner and thinner, till the moon reaches the position of *new moon*, and disappears. From "full moon" to "new moon," the moon is said to be *waning*; and from "new moon" to "full moon," *waxing*. The earth as seen from the moon presents similar phases, and has, consequently, at the time of new moon, the appearance of a round illuminated disc, and at full moon, is invisible. This explains the peculiar phenomenon occasionally observed when the moon is near the sun (either before or after new moon), of the part of the moon's face which is unilluminated by the sun appearing faintly visible, owing to the reflection upon it of strong earth-light. This phenomenon is designated by the Scottish peasantry as "the new mune wi' the auld mune in her arms." At new moon the moon of course comes above the horizon about the same time as the sun, and sets with him, but rises each day about 50 minutes later than on the day previous, and at the end of the first quarter, rises at mid-day, and sets at midnight, continuing to lag behind the sun. When at the full, she rises about sunset, and sets about sunrise, and at the commencement of her last quarter, she rises at midnight, and sets at mid-day.

*Distance and Magnitude.*—From repeated observations of the moon's horizontal *Parallax* (q. v.), and of the occultations by her of the fixed stars, her mean distance\* from the earth has been estimated at 237,600 miles, and as her angular diameter averages  $31' 26''$ , her actual diameter is 2153 miles, or a little less than  $\frac{3}{11}$ ths of the earth's diameter. Her volume is therefore about  $\frac{1}{49}$ th of that of the earth, and her density being only  $\cdot 577$  (that of the earth being taken as unity), her mass is only  $\frac{1}{88}$ th of the earth's mass; consequently, the force of gravity at her surface is so much less than it is at the surface of the earth, that a body which weighs 1000 pounds here, would at the moon weigh only 163 pounds.

*Orbit.*—The moon revolves round the earth in an elliptic orbit, with the earth in the focus; the eccentricity of the ellipse being equal to  $\cdot 05491$  of half its major axis, or more than  $3\frac{1}{4}$  times that of the earth's orbit. The plane of her orbit does not coincide with the ecliptic, but is inclined to it at an angle of  $5^\circ 8' 47\frac{1}{2}''$ , and intersects it in two opposite points, which are called the *Nodes* (q. v.). The point at which the moon is nearest to the earth is called her *perigee*, and that at which she is furthest from it her *apogee*, and the line joining these two points is called the *line of apsides*. Were the moon's orbit a true ellipse, which, owing to various irregularities known as *perturbations*, it is not, the *lunar theory* would be exceedingly simple; but these perturbations, which, in the case of the planets, produce a sensible variation in their orbit only after many revolutions, cause, in the case of the moon, a distinct and well-marked deviation from her previous course in a single revolution. The retrogradation of her nodes along the ecliptic causes a continual change in the plane of her orbit, so that if, during one revolution round the earth, she occults certain stars, at the next revolution she will pass to one side of them, and will remove further and further from them in each successive revolution. A little consideration will shew that by this continual change of her orbit, the moon will, in course of time, pass over or occult every star situated within  $5^\circ 24' 30''$  of the ecliptic. The motion of the nodes is so rapid that they perform a complete circuit of the orbit in 6798.39 mean solar days, or 18.6 years. Another important change in the moon's orbit is the revolution of the line of apsides, by which the perigee and apogee are continually changing their position relative to the earth and sun. This revolution is more than twice as rapid as that of the nodes, being performed in 8332.57 mean solar

\* When the moon is at the *perigee*, she is within 225,000 miles, and when at the *apogee* more than 251,000 miles from the earth; her angular diameter as measured from the earth consequently varies from  $28' 45''$  to  $33' 30''$ , and for a particular day is greatest when she is on the meridian, as in this case she is nearer to the spectator by about 4000 miles, than when she is on the horizon.

days, or 8-65 solar years. As this motion is common to all the heavenly bodies, its nature and origin will be treated of under the head of Perturbations (q. v.). Its effect upon the moon is to produce a variation in her distance from the earth, independent of that produced by her elliptic motion.

*Eclipses.*—As the moon in her course passes the sun at the commencement of every (synodic) month, and by the middle of the month has placed the earth between herself and the sun, it is evident that if she moved in the plane of the ecliptic, there would be either a *total* or an *annular eclipse of the sun* at the commencement, and a *total eclipse of the moon* in the middle of every month. The inclination of her orbit allowing her to pass the sun  $5^{\circ} 9'$  to the north or south of his track, prevents such a frequent occurrence of eclipses. If the moon, when in conjunction, is at either of her nodal points, and at the same time near her perigee, a total eclipse of the sun takes place; but if near her apogee, the eclipse is only annular, for at that time her apparent diameter is less than the sun's. If, also, at her conjunction, her latitude north or south is less than the sum of her semidiameter and of that of the sun, a *partial eclipse* takes place, and is greater the nearer the moon is to her node. These partial eclipses are seldom seen from all parts of the earth's illuminated surface, but are confined to a portion of it, which is greater or less according to the extent of the eclipse. Lunar eclipses, which occur when the moon is in opposition (i. e., at full moon), are seen equally from all parts of the earth's surface which are turned towards her. The conical shadow of the earth which is projected into space on the side opposite to the sun, is in length equal to about 3-5 times the moon's mean distance, and a section of it at the moon's distance is  $1^{\circ} 28'$  in diameter. If, then, the moon, which is never more than  $83\frac{1}{4}'$  in diameter, happens to be at or near her node, a total eclipse will take place, and in no case can it be *annular*, as is sometimes the case with those of the sun. Even during total eclipses, the moon is seldom quite invisible, but generally shines with a faint copper-colored light. See ECLIPSES.

*Rotation.*—The moon, like all other satellites, as far as at present known, revolves round her own axis in precisely the same time that she revolves round the earth; she thus presents always the same face to us, and consequently, though her comparative proximity has enabled us to become better acquainted with her surface than with that of any other heavenly body, our knowledge is confined to one-half of her surface, with the slight exception of the knowledge obtained from her *Libration* (q. v.). To the inhabitants of the side of the moon next the earth—if the moon had inhabitants, which is very improbable—the latter would appear as a luminary about  $2^{\circ}$  in diameter, immovably fixed in their sky, or at least changing its position only to the extent due to the moon's libration. The earth would thus seem to them to have a disc about 15 times larger than that of the sun.

*Physical Features.*—The surface of the moon, as seen from the earth, presents a most irregular grouping of light and shade. The dark portions were named by the earlier astronomers as seas, lakes, &c., and still retain these names, although there is strong evidence against the supposition that the moon, or at least that portion of it presented to us, contains any water. The brighter parts of the moon are mountainous, as is proved by the fact of their casting shadows when the sun's rays fall upon them obliquely, and also by the ragged appearance presented by the interior illuminated border of the moon, an appearance which can only be satisfactorily accounted for on the supposition that the surface of the moon is not level, in which case the higher portions will be illuminated some time before the light reaches the level parts; and it is observed that as the illumination proceeds, bright spots start up in advance of it, and when the moon is on the wane, these same spots continue to shine for some time after the surrounding surface is immersed in gloom. The mountains occur either singly, when they are generally of a circular form, and are called *craters*, or in groups, which are mostly annular, and form a sort of wall enclosing a deep depression or plain, in which are situated one or more conical mountains. The craters are not unfrequently 8 or 10 miles in diameter, and some of the walled plains measure more than 100 miles across. The principal mountain range is the Apennines, which crosses the surface from north-east to south-west, and attains, according to some authorities, an altitude of about 20,000 feet, though Sir John Herschel gives about 2 miles as the probable limit of elevation above the moon's surface. The heights are estimated from a micrometric measurement of the length of their shadows, a method not, in this case, susceptible of much

accuracy. The moon everywhere presents traces of volcanic agency, but no active volcanoes have yet been discovered, nor is there any sign of recent volcanic action. Seen through the telescope, she presents a bleak, desolate appearance, without indications of animal or vegetable existence. She appears to be devoid of an atmosphere, or if one exists, it must be of exceeding rarity.

The influence of the moon in causing *Tides* (q. v.) has long been well known, and there is some reason for supposing that she produces a similar effect on the atmosphere, combining with other causes in the generation of winds. Those winds which prevail about the time of new and full moon, and at the vernal and autumnal equinoxes, are particularly ascribed to her influence. On the supposition that the moon might also affect organic nature, experiments were instituted by Mead, Hoffmann, and others; but no certain results were attained. The periodicity which has often been noticed in certain diseases, especially in insanity (hence called *lunacy*), was long supposed to have some connection with lunar influence, and this opinion is held to some extent at the present day. The chemical effects of the moon's rays are, so far as is at present known, feeble, though in particular instances they exhibit an *actinism* as powerful as that of the sun. Decomposition of animal matter takes place more rapidly in moonshine than in darkness, and the moon's rays, when concentrated, have a sensible effect on the thermometer.

The best map of the moon is the large and accurate one of MM. Baer and Mädler, which presents a most minutely detailed picture of her visible surface; the map is 3 feet in diameter. See, for further information, the articles *PERTURBATIONS; LIBRATION; NODES; EYECTION; METONIC CYCLE; TABLES, LUNAR, &c.*

*Superstitions regarding the Moon.*—The moon was anciently an object of worship, and even in the 17th c. she was supposed, by the common people of England, to exercise great influence over human affairs. The times for killing animals for food, gathering herbs, cutting down wood for fuel, sowing seeds of various kinds, were all regulated by the "age" of the moon, and these set periods were considered to be a necessary part of practical knowledge, and ignorance or neglect of them to be infallibly productive of loss. There were similarly defined periods for taking particular medicines, and attempting the cure of particular diseases. Many such superstitious prevailed till a recent period in the Highlands of Scotland, favorable or unfavorable consequences from any occurrence being predicted according to the age of the moon at the time it happened. Throughout Scotland, the waning moon was considered to have an evil influence, and full or new moon to be the most auspicious season for commencing any enterprise. The same opinion was held in Scandinavia and Germany, and the history of all nations teems with similar superstitious. See the article *ECLIPSES*.

In the Edda, we read that "Mundilföri had two children—a son, Måni (moon), and a daughter, Sól (sun);" and in German, the moon is masculine and the sun feminine to this day. It was the same in Aug.-Sax.; although modern English has in this matter followed the classic mythology, in which Phœbus and Sol are gods; and Selene, Luna, and Diana, are goddesses; Grimm ("Deutsche Mythologie" p. 663) quotes an old invocation to the "New Moon, gracious lord" (Neuer Mon, holder herr), for increase of wealth; and down to recent times the German people were fond of speaking of "fräi sonne," and "herr mond" ("lady sun," and "lord moon"). The same inversion (as it appears to us) of gender is found among the Lithuanians and Arabians, and even the ancient Mexican Mexitli (moon) was masculine. Among the Slaves, according to Grimm, the moon is mas., a star fem., and the sun neut. In Hindu Mythology, also the moon—Chandra or Soma—is a male deity, represented by one myth as the son of the patriarch Atri, who procured him from his eyes, but by another, as arising from the milk-sea when it was churned by the gods for the attainment of the beverage of immortality. His wives are the 37 daughters of the patriarch Daksha, known as the nymphs of the lunar constellations. By one of them, Rohini, he had a son Budha (not to be confounded with Buddha), the regent of the planet Mercury, who begot on Ilā, a son, Purāṇavaś, who became the ancestor of a royal family, hence called the lunar dynasty.—The moon is generally represented as wearing white garments, with a mace in one hand, and riding in a chariot drawn by ten horses or antelopes. The animal sacred to him is the hare (the Hindus believing that an outline like that of a hare is visible on the moon); and the plants under his special patronage are a certain variety of the lotus, which

flowers when the moon rises, and the Soma plant, or *Asclepias acida*. As the receptacle of the beverage of immortality, he is thus described in the Vahn'n-Purâ'u'a: "The radiant sun supplies the moon, when reduced by the draughts of the gods to a single digit, with a single ray; and in the same proportion as the ruler of the night is exhausted by the celestial, it is replenished by the sun....; for the gods drink the nectar accumulated in the moon during half the month; and from this being their food they are immortal: 33,000, 3300, and 33 divinities drink the lunar nectar. When two digits remain, the moon enters the orbit of the sun, and abides in the ray called Amâ.... In that orbit, the moon is immersed for a day and night in the water, thence it enters the branches and shoots of the trees, and thence goes to the sun.... When the remaining portion of the moon consists of but a 16th part, the manes approach it in the afternoon, and drink the last portion, that sacred digit which is composed of nectar.... In this manner the moon, with its cooling rays, nourishes the gods in the light fortnight (or the 15 days of the moon's increase), the manes in the dark fortnight (when in the wane); vegetables, with the cool nectary aqueous atoms it sheds upon them; and through their development it sustains men, animals, and insects, at the same time gratifying them by its radiance."

**MOON, Mountains of the.** The "Mountains of the Moon" have ever played an important part in the history of African geography, and have given rise to many curious hypotheses. Ptolemy, and until lately, many of the ablest geographers, supposed that a very high chain of mountains crossed the continent of Africa from east to west; and they have continued to shift these mountains from one latitude to another, ranging from 10° north to 10° south, but still keeping them within nearly the same meridional bounds. Dr Beke, from his own researches and a minute study of the geography of Eastern Africa, propounded the theory, that the so-called Mountains of the M. run from north to south parallel to the coast of Zanzibar, instead of from east to west; forming, in fact, a continuation of the great Abyssinian table-land, and embracing the snow-capped mountains of Kenia and Kilimandjaro, which have an altitude of 20,000 feet.

The mass of mountains discovered by Captain Speke in 1858, round the head of Lake Tanganyika, is considered by him, both from its crescent form and its position, to be part of the Mountains of the M. of Ptolemy; but mountains of this height (6000 to 10,000 feet) could never be snow-clad so near the parallel of the equator.

**MOONJAH, Munjah, or Moonyah** (*Saccharum Munja*), a grass of the same genus with the sugar-cane, a native of India, the leaves of which afford a useful fibre, of which ropes are made. The M. grows in vast abundance in the neighborhood of the Ganges, Indus, and other rivers. The fibre of the M. is very tough and strong. No proper trial seems yet to have been made of the qualities of the M. fibre, more carefully prepared; but considering the facility with which it could be obtained in any desirable quantity, it seems to deserve attention.—Very similar to the M. is the **SARA** or **SHUR** of Bengal (*Saccharum Sara*), another species of the same genus, the leaves of which are employed in the same way.

**MOONSTONE.** See **FELSPAR**.

**MOORE, John, M.D.,** a Scottish physician and miscellaneous writer, son of the Rev Charles Moore, an Episcopalian clergyman, was born at Stirling, in 1730. Educated at the university of Glasgow, he began the study of medicine and surgery under Dr Gordon, surgeon of that city, which study he followed up in Holland, London, and Paris, and then, as the partner of his old master, Dr Gordon, began to practise in Glasgow. As medical attendant to the Duke of Hamilton, he spent five years in travelling on the continent, and on his return in 1778, settled in London. In 1779, he published "A View of Society and Manners in France, Switzerland, and Germany" (Lond. 2 vols. 8vo). In 1781, appeared "A View of Society and Manners in Italy" (2 vols. 8vo); in 1786, his "Medical Sketches," in two parts; and in 1789, "Zeluco," a novel (2 vols. 8vo)—the principal, or, at anyrate, the most popular of his works. His other works are—"A Journal during a Residence in France," 1792 (2 vols. Lond.), descriptive of scenes witnessed while at Paris in the autumn of that year as medical attendant of the Earl of Lauderdale; "A View of the Causes and Progress of the French Revolution" (2 vols. Lond. 1795); "Edward," a novel (Lond. 1796); and "Mordaunt," a novel (Lond. 1800, 3 vols. 8vo). He also edited a collected

Moore  
Moorfow

240

edition of Smollett's works, with a life of the author. He died at Richmond in Surrey, Feb. 20, 1802.

**MOORE**, Sir John, English general, born at Glasgow, 1761, was eldest son of the preceding. He entered the army as ensign when only 15, and served with distinction in Corsica, as colonel; in the West Indies, as brigadier-general; in Ireland, during the rebellion of 1798, and in the expedition to Holland, as a general of staff. He was in Egypt with the army under Abercromby, and obtained the order of the Bath for his services in command of the reserve. When war again broke out in 1802, M. served in Sicily and Sweden. In 1806, he was sent with a corps of 10,000 men to strengthen the English army in the Peninsula. He arrived in Mondego Bay, August 19, and assumed the chief command on the return to England of Sir H. Burrard. In October he received instructions to co-operate with the forces of Spain in the expulsion of the French from the Peninsula. He moved his army from Lisbon, with the intention of advancing by Valladolid, to unite himself with the Spanish general Romana, and threaten the communications between Madrid and France. But the apathy of the Spaniards, and the successes of the French in various parts of the Peninsula soon placed him in a critical position. Yet he had determined to make a bold advance from Salamanca to attack Soult, when the news reached him that Madrid had fallen, and that Napoleon was marching to crush him at the head of 70,000 men. M.'s forces amounted to only 25,000 men, and he was consequently forced to retreat. In December, he began a disastrous march from Astorga to Coruña, a route of near 250 miles, through a desolate and mountainous country, made almost impassable by snow and rain, and harassed by the enemy. The soldiers suffered intolerable hardships, and arrived at Coruña in a very distressed state. It was impossible to embark without fighting, and Soult was in readiness to attack as soon as the troops should begin to embark. The battle was mainly one of infantry, for the cavalry, after destroying their horses, had gone on board, and the bulk of the artillery, for which the ground was not adapted, had also been withdrawn. On the 16th January 1809, the French came on in four strong columns. A desperate battle ensued. While animating the 42d Regiment in a brilliant charge in an early stage of the action, M. was struck by a cannon-ball on the left shoulder, and died in the moment of victory. The French were defeated with the loss of 2000 men; and the funeral obsequies of the deceased soldier were performed with melancholy solemnity just before the embarkation of his troops. The British army in this expedition lost their magazines and 6000 soldiers. A monument was erected to M.'s memory in St Paul's Cathedral.

**MOORE**, Thomas, the son of a small tradesman, who, through the influence of Lord Moira, afterwards became a barrack-master in the army, was born in Dublin on the 28th May 1779. At an early age, he was placed at a school in which Sheridan had formerly been a pupil. In 1798 he was sent to the Dublin University, where he ultimately took the degree of B.A. Before entering the university, he had written verses for a Dublin magazine; and while there, he translated the "Odes" of Anacreon, in the hope of obtaining a classical premium, in which, however, he was disappointed. In Dublin he acquired Italian and French, and being fond of music, he learned to play on the piano—an accomplishment which was of service to him in his future career.

In 1798, with his translation of Anacreon in his pocket, he came to London to study law, and entered himself in the Middle Temple. In 1800 he published his translations, dedicated to George IV., then Prince of Wales. In 1802 he produced his "Poetical Works of the Late Thomas Little"—a volume of sweet but licentious verse, which was a good deal blamed and very widely read. In 1803, through the influence of Lord Moira, he was appointed to a government post at Bermuda. He arrived there in January 1804; but finding his situation disagreeable, he committed his duties into the hands of a deputy, and travelled in America previous to his return to England. His transatlantic experience seems to have cured him of the democratic ideas which he had imbibed in Dublin. On his return to England he published "Odes and Epistles," for which he was sharply taken to task in the "Edinburgh Review." A duel between himself and Jeffrey was the consequence—over which Byron made so much mirth—and which resulted in the combatants becoming the

most excellent friends. In 1807 he engaged with Mr Power to produce the "Irish Melodies," and on this work he was engaged at intervals up till 1834. In 1811 he married, and shortly after he went to reside in Derbyshire, where in 1813 he produced "The Twopenny Post-bag," full of brilliant fancy—in which the tropes not only glittered but stung.

As up to this time he had produced nothing but fugitive pieces, he became anxious to emulate his brethren, who wrote long poems and published in quartos. He fixed on an oriental subject, and the Messrs Longman agreed to purchase the poem for 3000 guineas. In 1817 the long expected "Lalla Rookh" appeared—brilliant as a firefly, and the whole English world applauded. After the publication he went to Paris, where he wrote "The Fudge Family," which appeared in 1818. At this time he learned that his deputy in Bermuda had misconducted himself, and that he had become liable for a large sum, which was afterwards, however, considerably reduced. Lord Lansdowne paid the claim, and M. repaid his lordship afterwards.

In 1819, M. went to Paris with Lord John Russell, and extended his tour to Italy, and saw Lord Byron at Venice. He returned to Paris, where he brought his family, and fixed his residence till 1822. Here he wrote "The Loves of the Angels," which appeared in 1823, and "The Epicurean," a prose romance, which was not published till 1827. On his return to England, he fixed his abode at Sloper-ton Cottage, near Bowood, and issued the "Memoirs of Captain Rock" in 1824, and the "Life of Sheridan" in 1825.

Byron had handed over to M., for his own especial benefit, a manuscript autobiography, on the condition that it should not see the light till after its author's death. Byron died in 1824, and as, at the request of his lordship's relatives, the manuscript was destroyed, M. then entered into arrangements with Murray to produce a life of the deceased poet. The "Life of Lord Byron" was published in 1830 in two volumes. Next year, he published the "Life of Lord Edward Fitzgerald." His last important work was a "History of Ireland," published in "Lardner's Cyclopaedia." A pension of £300 per annum was conferred on him in 1835. In 1841, he brought out an edition of his entire poetical works. For the three years preceding his death, he was afflicted with softening of the brain. He died on the 25th February, 1852. His friend, Lord John Russell, published his "Memoirs, Journal, and Correspondence," in 8 volumes (1852—1856).

Despite his popularity during his lifetime, M. can hardly be placed in the rank of great poets. His muse is a spangled dancing-girl—light, airy, graceful, but nothing more. His most ambitious work, "The Loves of the Angels," is far beneath the Miltonic, or even the Byronic standard. "Lalla Rookh" is brilliant, but fatiguing. He is most successful in polished satire and the lighter sentiments; and his reputation will ultimately rest on "The Twopenny Post-bag" and the "Irish Melodies."

**MOORFOWL**, Red Grouse, or, in books of natural history, Red Ptarmigan or Brown Ptarmigan (*Lagopus Scoticus*), a bird peculiar to the British Islands, and affording more amusement to sportsmen than any other kind of feathered game in Britain. It is the bird generally known in Britain by the name *Grouse*, although not a true species of Grouse, but rather of Ptarmigan (q. v.). The toes are completely feathered, as well as the legs; the bill is very short, and its base much concealed by feathers. The length of the M. is about sixteen inches, of which about four inches belong to the tail. The tail is nearly square. The wings are short. The plumage is of a deep chestnut-brown color, marked on the back and wing-coverts with black spots, and on the under-parts with undulating black lines; the four middle tail-feathers are also marked with transverse black lines. Above the eye is a naked space (the cere), of a bright scarlet color. The M. is plentiful in the moors of Scotland and the Hebrides, Wales, the north of England, and Ireland. It feeds on the tender tops of heath, crowberries, bilberries, &c.; and not unfrequently visits the fields of oats and other grain in the vicinity of the moors, particularly when the *stocks* remain long in the field in late and rainy harvests. The M. is not polygamous, and pairs in spring, when the plumage—particularly of the male—assumes a lighter and redder tint. The female lays from eight to fifteen eggs. The nest is on the ground, often under shelter of a tuft of heath. The young run about very soon after they are hatched. "Grouse" remain in *coveys* (broods) from the time they are hatched till late in the autumn, after which they "pack" or assemble in large

**Moorehen**  
**Morat**

242

bodies.—A cream-colored variety of *M.* is sometimes found in the north of England.—The *M.* is easily domesticated, and breeds readily in an aviary, if supplied with heath for food.

**MOORHEN.** See **GALLINULE**.

**MOORING** (allied probably to Dutch *marren*, to delay, fasten; Eng. *marine*, for fastening the sail to the bolt-rope; Lat. *mora*, delay), a fastening to retain a ship in a given position. This may be either by her own anchors, or (which is the more common meaning of the term) by fixed and permanent buoy, which, on its part, is anchored to the bottom. A chain-moorings is where a strong chain is stretched for some distance on the bottom, being securely anchored or otherwise made fast at each end, and perhaps in intermediate places. Numerous buoys are then floated from it, and it becomes the mooring-ground for many vessels. Chain-moorings are frequent in all large harbors where comparatively small vessels require to ride.

**MOORISH ARCHITECTURE.** See **ARABIAN ARCHITECTURE**.

**MOORS** (Lat. *Mauri*, meaning dark; Spanish, *Moros*) are a people who form the great majority of the population of Barbary. Their appearance indicates their origin, which is a mixture of the Mauri (from whom they derive their name), Numidians, Phœnicians, Romans, and Arabs, who have successively held possession of the country. In consequence, they are found to vary considerably in appearance and character in different parts of Barbary, but all shew more or less strongly the symptoms of a considerable infusion of Arabian blood. They are a well-formed race, with fine oriental features, and a mild and melancholy expression of countenance. They are more friendly and sociable than the Bedouins and Berbers, who inhabit the deserts and mountains; but are inferior to them in mental ability, besides being voluptuaries and cruel. They constitute, generally speaking, the tradesmen, artisans, merchants, and agriculturists of Barbary; but a considerable number lead a pastoral life. The dress of the *M.* consists of a piece of woollen cloth, five ells in length by one and a half in breadth, called a "haïque," which is thrown over the shoulders and fastened round the body; it also serves as a covering by night. This, when supplemented by a pair of slippers, a red cap, and a hood, constitutes the sole habiliment of the people generally. In the towns, the "caftan" is generally worn over the haïque. The *M.* employ the Arabic language, but with many corruptions and deviations from the original, and these appear to increase towards the west.

As the Arab conquerors of Spain invaded that country from Africa, where they had largely recruited their forces, they were naturally enough called Moors, and in Spanish history the terms Moors, Saracens, and Arabs are synonymous. From this mixed Moorish-Arab race sprung the *Moriscos*, who were permitted by Ferdinand the Catholic to remain in Spain after the expulsion of their countrymen, on condition of their embracing Christianity. A cruel persecution, which was originated by Philip II., drove them to rebellion (1567–70), and in 1571, many emigrated to Africa; those who remained being, to the number of 500,000, expelled in 1610 by Philip III.

The *M.* first appear in modern history as the allies of the Vandals in their invasion of Africa, and were continually rebelling against the Byzantine emperor. They were next, after a severe struggle, conquered and converted by the Arabs in 707. In 1091, they were summoned by the latter into Spain, to aid in stemming the tide of Christian conquest; and after faithfully supporting the Arab calif of Cordova, &c., till his dominions fell into the hands of the king of Leon and Castile, they retired, in 1238, to Granada, where they founded their kingdom. The kings of Granada carried on a vigorous, and, at the same time, chivalrous warfare with the kings of Castile; but at length, weakened by internal discord, were compelled to succumb to Ferdinand the Catholic in 1492. The *M.*, or at least that portion of them who refused to adopt Christianity, were then expelled from Spain, and, in revenge, founded in 1518 the piratical states of Algiers and Tunis. Their subsequent history cannot be separated from that of Algiers, Tunis, and Morocco.

**MOORUK** (*Casuarus Bennettii*), a recently discovered bird of the same genus with the Cassowary (q. v.), of which it was at first regarded as a mere variety, a na-

tive of the island of New Britain. It is about five feet in full height, three feet to the top of the back, is of a reddish color, mixed with black, and has a horny plate instead of a helmet-like protuberance on the top of the head. The claw of the inner toe of each foot is very long. It becomes extremely tame and familiar in captivity; may be fed on potatoes, maize, or any similar food; and is apt to prove troublesome by swallowing anything, however indigestible, that may come in its way.

**MOOSE.** See **ELK.**

**MOQUE'GUA**, a town of Pern, capital of a province of the same name, 68 miles north-west of Tacna, on the great route west of the Cordilleras. In the province are many large vineyards, which produce great quantities of wine and brandy. Pop. 9000.

**MO'RA** (Lat.) is a word often used in Scotch law to denote delay caused by negligence. In England and Ireland, the corresponding word is *Laches* (q. v.).

**MORA**, a genus of trees of the natural order *Leguminosæ*, sub-order *Cesalpiniceæ*, containing only one known species, *M. excelsa*, discovered by Sir R. Schomburgk, and described by him as the most majestic tree of Guiana. The timber is said to be equal to oak of the finest quality. It is already a considerable article of commerce, under the name of *Mora wood*. It is darker than mahogany. It is valued for ship-building.

**MORACEÆ**, a natural order of exogenous plants, or, according to many botanists, a sub-order of *Urticeæ* (q. v.). The *M.* are trees or shrubs with rough leaves and sometimes with climbing stems; they have a milky juice; the flowers are very small; the fruits of many flowers are often enclosed in a succulent receptacle, or the calyx becoming fleshy, all the fruits of a head or spike become combined into one. There are about 200 known species, natives of temperate and tropical climates. Some are valuable for their fruit, some for the caoutchouc obtained from their milky juice, and different parts of others are applied to various uses. Among the species are figs, mulberries, Osage orange, fustic, and contrayerva.

**MORADABA'D**, a town of British India, capital of a district of the same name, is situated on a slightly elevated ridge between the Ramgunga and the Ganges, 90 miles east-north-east of Delhi. There is a large jail, capable of holding 1800, for native convicts. West of the town, and separated from it by the jail, are the cantonments for the troops, agreeably situated amid luxuriant trees; the chief duty of the troops is to guard the convicts. Pop. (at census of N. W. Provinces, 1872), 62,417.

**MORAINÉ.** The masses of rock which, by atmospheric action, are separated from the mountains bounding the valleys along which glaciers flow, find a temporary resting place on the surface of the ice, at the margin of the glacier, and are carried along with it, but so slowly, that they form a continuous line along each margin. These lines of debris are called *lateral moraines*. When two glaciers unite, the two inner moraines unite also, and form one large trail in the middle of the trunk glacier, and this is called a *medial moraine*. A large portion of these rocky fragments at length reaches the end of the glacier, and here the melting ice leaves it as a huge mound, which is known as a *terminal moraine*. See **GLACIER**.

**MORA'LITIES.** See **MYSTERIES**.

**MORALS.** See **ETHICS**.

**MORA'NO**, a city of Southern Italy, in the province of Cosenza, built on a hill in a wild and rugged neighborhood, 85 miles north-north-west of Cosenza. Pop. 8350. It has good manufactures of silk, cotton, and woollen fabrics.

**MORAT** (Lat. *moratum*, Ger. *Murten*), a town of (1871) 2323 inhabitants, in the canton of Fribourg, Switzerland, on the Lake of Morat, about twelve miles from Bern, famous for the victory of the Swiss and their allies over Charles the Bold, Duke of Burgundy, June 22, 1476. The duke, exasperated by his defeat at Grandson, in March, appeared before the Gates of M., with 40,000 men. The Swiss were aided by Strasburg, Basel, Colmar, and other Rhenish cities, and by Duke René of Lorraine, whom the Duke of Burgundy had driven from his possessions; but the superiority of numbers was greatly on the side of the Duke of Burgundy. The

assault of the Swiss, nowever, was very impetuous, and their victory complete; the duke's camp fell into their hands, and he himself only escaped by the swiftness of his horse.

MORATÍN, Leandro Fernandez de, the most eminent comic poet that Spain has produced in recent times, was born at Madrid, March 10, 1760. His father, Nicolas Fernandez de Moratin, was also a poet of some eminence, but having found that literary labors afforded a precarious support, he wished his son to learn the trade of a jeweller, by which, after his father's death, he, in fact, for some time supported himself and his mother. In 1790, appeared his first and best comedy, "El Viejo y la Niña;" it was followed by "La Comedia nueva El Barón," "La Mogigata," and "El sí de las Ninfas." Prince Godoy conferred several ecclesiastical benefices upon him, though the Inquisition set its evil eye upon the poet. Joseph Bonaparte made him chief royal librarian; and after 1814, he took refuge in Paris. His last work was the "Origenes del Teatro Español." He died in Paris, June 21, 1828.

MO'RAVA, the chief river of Servia. It is formed by the union of two head streams—the eastern or Bulgarian M., which rises in the mountains to the south of the new southern frontier of Servia; and the western or Servian M., which rises on the western frontier. The united stream flows northward to the Danube, and has a total length of about 180 miles.

MO'RAVA, or, more properly, March (called by the ancients *Marus*), a river of Austria, has its origin on the southern slope of the Schneeberg, on the borders of Prussian Silesia, 3382 feet above sea-level. It is the chief river of Moravia, to which it gives its name, and flows south through that crown-land, receiving on the right the Thaya, and falling into the Danube, eight miles above Presburg. In its lower course, it forms the boundary between Lower Austria and Hungary. Its course is 184 miles in length, and it is navigable from Göding, upwards of 60 miles from its mouth.

MORA'VIA (Ger. *Mähren*), a crown-land of the Austrian empire, situated in 48° 40'—50° n. lat., and 15° 5'—18° 45' e. long. It is bounded n. by Prussian and Austrian Silesia, e. by Hungary and Galicia, s. by the duchy of Austria, and w. by Bohemia. The superficial area is about 8480 square miles; and the population in 1870 was 2,017,974.

M. is enclosed and traversed on all sides by mountains, being separated from Silesia by the range of the Sudetes; from Bohemia, by the Moravian chain; and from Hungary, by the Carpathian Mountains; while branches of these various chains intersect the whole country except in the south, where the land consists of extensive plains, lying about 800 feet above the level of the sea. The numerous small rivers of the interior follow a south-east direction; and fall into the March or Morava, from which the country derives its name, and then flow together with the latter into the Danube. The Oder, and its affluents the Elbe and Oppa, rise among the mountains on the north-east, from whence their course is soon turned directly away from the Moravian territory. There are few extensive lakes, but numerous ponds and small streams, which abound in fish. The more elevated parts of the country are not fertile, and the climate is severe; but in the mountain valleys and on the southern plains, the soil is remarkably rich, and the temperature more genial than in other European countries lying in the same parallel. M., which ranks as one of the richest of the Austrian dominions, has half of its area in arable land. It yields fine crops of grain, and among the other natural products grown for exportation, we may instance hops, mustard, potatoes, clover-seed, beet-root; and in the south maize, grapes, chestnuts, and many other of the less hardy fruits and vegetables. The breeding of cattle and sheep, and the making of cheese from sheep's milk, constitute an important branch of industry; in the southern districts of the Hanna (a plain famous for its fertility), horses are bred for exportation. Geese and fowls are reared in large numbers for the sake of their feathers, and the keeping of bees is conducted with great success. The mineral products include iron, alum, saltpetre, coal, graphite, whetstones, sulphur, vitriol, pipe-clay, marble, and topazes, garnets, and other precious stones.

*Industry, &c.*—The principal branches of industry are the manufacture of linen and thread, which now enjoy a European reputation, and those for cotton goods at

Sternberg. M. has long been noted for the excellence of its cloths, flannels, and other woollen fabrics, and for its leather goods. The minerals of M., especially coal and iron, are important, and are extensively wrought. Beet-sugar is largely manufactured. Brünn (q. v.), the capital, is the chief emporium for the manufacturing trade, and Olmütz (q. v.) the principal cattle-mart.

The educational wants of the province are provided for by 12 gymnasias and about 1900 schools. The former university at Olmütz is now represented by a theological faculty, and by a large technical institute. The majority of the people belong to the Church of Rome. There are about 50,000 Protestants and 40,000 Jews.

In regard to nationality, the population may be divided as follows: About 500,000 Germans, nearly a million and a half of Slavs, and 50,000 belonging to other races (including Jews). The Slavs of M. are mostly Czechs, with Poles and a few Croats. The Czechs are inferior in all respects to their brethren in Bohemia. The Moravian Poles, although inferior to the Germans as regards industry and cultivation, are a physically well developed, courageous, and enterprising people.

*History.*—M. was anciently occupied by the Quadi, who, on their migration in the 5th c. to Gaul and Hispania, were replaced first by the Rugii, next by the Heruli and Lombards, and finally by a colony of Slavonians, who, on their settlement in the country, took the name of Moravians, from the river Morava. Charlemagne, who brought the people under nominal subjection after they had spread themselves over a territory greater than the present M., constrained their king, Samoslav, to receive baptism; but Christianity was first formally established in the middle of the 9th c. by Cyril, who must be regarded as the true apostle of the land. M. was made tributary to the German empire before the close of the century; but in 1029, it was incorporated with Bohemia, after having for a time been a prey to the incursive attacks of its Slavonic and Teutonic neighbors. At the close of the 12th c., M. was erected into a margraviate, and declared a fief of Bohemia, to be held from the crown by the younger branches of the royal House. On the death of Lewis II. at the battle of Mohacz in 1526, M., with all the other Bohemian lands, fell to Austria, in accordance with a pre-existing compact of succession between the royal Houses. Since then, it has shared the fortunes of the empire, and in 1849 it was formally separated from Bohemia, and declared a distinct province and crownland.

**MORAVIANS** (called also *United Brethren*, *Moravian Brethren*, or *Bohemian Brethren*), a religious community, tracing its origin to the followers of John Huss, who were expelled by persecution from Bohemia and Moravia in the beginning of the 15th c., and of whom a small company, consisting at first of only ten persons, received permission from Count Zinzendorf (q. v.), in 1722, to settle on his estate of Berthelsdorf, in Saxony. To this settlement they gave the name of Herrnhut, whence they are commonly known in Germany as Herrnhuters. It rapidly increased, not only by the accession of additional Bohemian and Moravian refugees, but also of other Christians, who were attracted by the faith and piety which remarkably prevailed in it. Zinzendorf joined the little brotherhood, devoted his whole estate to the propagation of Christianity, and undertook the work of the ministry. The doctrines which they received being those of the Augsburg Confession, it was proposed that they should unite themselves with the Lutheran Church; but a difference of opinion existing on this point, it was decided, as difficult questions still sometimes are among the M., by an appeal to the lot; and the result was, that the *United Brethren*, or *Unitas Fratrum*, as they termed themselves, remained a distinct community, and adopted an organisation of their own. Till Zinzendorf's death in 1760, he was really their leader, and was recognised by them as *Ordinarius*. After his death, their organisation was completed by synods held in 1764 and 1769.

The M. are recognised by the state in Germany, as Protestants attached to the Augsburg Confession. They have no symbolical books of their own, although they drew up a simple and brief confession of their faith in 1727, and a brief statement of principles was emitted by a synod held in 1775.

The M. profess to be connected with the Bohemian or Moravian Brethren of former times by a regular succession of bishops. The bishops, however, exercise no episcopal authority, and their chief peculiar function is that of ordination, of which they alone have the power. Every congregation is governed by a *Conference of Elders*. The elders are bound to visit each family once in three months, and to report concerning the maintenance of family worship, and the conduct of the brethren.

Moray  
Mordaunt

246

It is also their duty to visit the sick, and to aid the poor with money contributed by the other brethren. The whole church is governed by synods, which meet—always in Germany—at intervals of ten or twelve years, and are composed not only of bishops, but also of other members of the brotherhood. Between one synod and another, all affairs are managed by a *Conference of Elders* appointed by the synod.

M. are to some extent scattered amongst the general population of the countries in which they dwell, as Britain and America; but they prefer, where it is possible, to live in colonies, or separate societies, and in these they carry out some very peculiar parts of their organisation, particularly a division into *choirs* of children, youths, maidens, unmarried brethren, unmarried sisters, widowers, and widows, each having a separate leader or pastor. Unmarried brethren, unmarried sisters, widowers, and widows, reside in separate houses; married couples in houses of their own. Colonies of M. exist in England, America, Holland, and other countries, but are most numerous in Germany. The most important colonies, however, are perhaps those in the mission-fields. The Brethren early entered on missionary work, and all the prosperity of their church has been evidently connected with their earnest prosecution of it. Their first mission was planted, in 1733, in the island of St Thomas, in the West Indies; the missionaries who went thither expressing their resolution to become slaves, if necessary, in order to carry out their purpose. A mission to Greenland, which has been eminently successful, and may be said to have made Greenland a Christian country, was commenced in 1733. They have also interesting missions in Labrador and at the Cape of Good Hope, and in other heathen countries. The M. have at their mission-stations about 70,000 converts from heathenism. One of the most interesting of their stations is at Sarepta, in the government of Saratov, in Russia, by which they are connected with the Tartars and Kalmycks. In all their settlements, the education of the young receives the utmost attention.

The religious services of the M. are conducted with great simplicity. They meet for worship daily, in the evening, the service being much like that of a *prayer-meeting* amongst other Christians. They use a litany on the Lord's Day, but extemporary prayer is frequent. They admit the use of instrumental music. They maintain the practice of washing the feet, both in choirs and in congregations, before the communion. They meet on the last day of the year, to bring in the New Year with prayer and other exercises of religion. On Easter morning, they assemble in the burying-ground to celebrate the resurrection of Christ, and to express their confidence concerning the brethren who have died during the preceding year. The death of a member of the brotherhood is made known in the chief settlements by sound of trumpet, as if for victory; the melody indicating the particular choir to which the deceased belonged. In some of the settlements peculiar dresses are worn by the members of particular choirs.

In 1875, there were in Europe 63 congregations of M., with 9131 communicants; and in America, 75 congregations, with 8315 communicants. Seventeen bishops were living in 1875, of whom 6 were in the United States. There were 92 mission stations, with 333 missionaries, and above 1000 native assistants, having the care of 59,843 communicants.

**MORAY FIRTH**, an indentation of the German Ocean, on the north-east coast of Scotland. Its north-west shore is formed by the counties of Ross and Cromarty, and extends from Kessock Ferry, opposite Inverness, to Tarbet Ness. Its south-east shore extends from Inverness to Burghhead, in Elginshire. The entrance of the firth between Burghhead and Tarbet Ness is 16 miles in width; and from its entrance to Inverness it is 81 miles in extent. The firth is continued westward from Inverness by a branch called Beaulieu Basin.

**MORAYSHIRE.** See **ELGINSHIRE**.

**MORBID APPETITES** may consist of a desire which is, in character, natural and necessary to the animal economy, but becomes unhealthy when excessive and irresistible. Of this, the hunger which attends marasmus, and the thirst which attends diabetes, may be cited as illustrations. They may consist further, in a craving for articles or objects not in reality deleterious or detrimental, but which do not constitute the ordinary gratification of the appetite, such as the desire for chalk and lime experienced by chlorotic and hysterical women. They may, thirdly, consist

in the longings, often complicated with delusions, felt by pregnant women and others, which are injurious, repugnant to nature, and revolting. Georget gives an instance where a wife coveted the shoulder of her husband, killed him in order to obtain the morsel, and salted the body in order to prolong the hideous cannibalism. In such a case, the gross longing may be said to constitute the disease; but there are others in which it is one of many symptoms demonstrating the degradation of the mind under general disease, as when the insane devour garbage, excrement, or swallow grass, hair, stones.—Georget, "Dict. de Médecine;" Feuchtersleben, p. 276.

**MORBIHAN**, a maritime department in the north-west of France, formed out of ancient Bretagne. Area, 2615 sq. miles; pop. (1876) 506,573. The coast is much indented, and has a multitude of bays, roadsteads, harbors, and islands. The largest island is Belle Isle (q. v.). The department has a somewhat hilly appearance, but towards the sea, the land stretches out in rich plains, interrupted, however, by great tracts of heath and marsh. The climate is mild, but moist. The soil is not well cultivated, but yields sufficient grain for home consumption. The heaths afford fine pasturage, and support great herds of horned cattle, sheep, and horses. The rearing of bees is a source of very considerable revenue; as also are the river and coast fisheries. The trade in sardines is particularly extensive. The want of wood is so great, that the peasants are obliged to burn dung extensively. The chief mineral is iron, but there are almost no manufactures. M. is divided into the four arrondissements of Vannes, L'Orient, Ploermel, and Pontivy. The chief town is Vannes (q. v.), but the most populous is L'Orient (q. v.).

**MORDANTS.** See DYING.

**MORDAUNT**, Charles, Earl of Peterborough, military and naval commander, and one of the most brilliant Englishmen of his time, was the son of John Lord Mordaunt, and was born in 1658, some say 1662. He served as a boy in the navy, and then entered the army. He took part against James II., and was made Earl of Monmouth by William III., succeeding afterwards to the earldom of Peterborough, as heir to his uncle. During the war of the Spanish Succession, the English government determined to send an expedition to Spain. It was placed under the command of M.; and in June 1706, he arrived in Lisbon with 5000 Dutch and English soldiers. After taking on board the Archduke Charles of Austria, who claimed the Spanish crown, the armament proceeded to Valencia. Here M., with characteristic daring, conceived the idea of making a dash at Madrid, and finishing the war at one blow. He was overruled by the archduke and the Prince of Hesse, and compelled to besiege Barcelona, which was defended on one side by the sea, and on the other by the strong fortifications of Montjuich. By a *coup de main*, he made himself master of Montjuich. Barcelona fell, and M., with a handful of men, entered one of the strongest cities of Europe. He pushed his successes into the interior. Several towns submitted. He marched to Valencia in the depth of winter, and at the head of 1,200 men defeated a Spanish force of 4000. The Spaniards sent a large army into Catalonia, and a French fleet appeared off Barcelona. M. harassed the enemy's army, and putting himself on board the English squadron, directed a movement which, had it been executed a few hours earlier, would have resulted in the capture of the whole French fleet. The Frenchmen put to sea, and Barcelona was saved. M. again wished to march towards Madrid, but his plan for gaining possession of the capital was once more rejected by Charles. He accordingly left the army in a fit of pique, and went to Italy. In 1707, he returned to Valencia, as a volunteer, and gave excellent advice, which was not followed. He was recalled to England, and from that moment the tide of fortune ran strong against the Austrian cause. Few generals have done so much with means so small, or displayed equal originality or boldness. His fertility and activity of mind were admirably seconded by a most intrepid spirit. His splendid talents, on the other hand, were disfigured by vainglory, and a morbid craving for novelty and excitement. He loved to fly round Europe, and was said to have seen more kings and postillions than any other man of his day. On his return, he made common cause with the Tories, to spite the Duke of Marlborough, and received the Garter and other dignities for his services. On the accession of George I., he was appointed commander-in-chief of the naval forces of Great Britain; but was never again employed in active service. He died at Lisbon 25th October 1785. His witty, yet affectionate letters to Pope, Swift, Prior &c., give a

fine insight into his private character. See Elliot Warburton's "Memoir of Charles Mordaunt, Earl of Peterborough and Monmouth, with Selections from his Correspondence," 2 vols. (1853). His character has been sketched by Horace Walpole, in his "Catalogue of Royal and Noble Authors;" and with still greater force and picturesqueness by Macaulay.

MORE, Sir Thomas, Lord Chancellor, and one of England's worthiest sons, was born in Milk Street, London, in 1478, son of Sir John More, Justice of the Queen's Bench. He was educated at St Anthony's School, Threadneedle Street; and in his fifteenth year was placed in the house of Cardinal Morton, Archbishop of Canterbury, who used to say of him: "This child here waiting at the table, whosoever shall live to see it, will prove a marvellous man." Dean Colet, too, was wont to say: "There was but one wit in England, and that was young Thomas More." In 1497, M. went to Oxford, where he made the friendship of Erasmus. He then applied himself to the law, and studied first at New Inn, and afterwards at Lincoln's Inn. He was appointed reader at Furnival's Inn, where he lectured for three years. At the accession of Henry VIII., his professional practice was considerable, and he also held the office of judge of the Sheriff's Court in the city—his income from these sources being equivalent to £4000 or £5000 of our present money. He went on several missions abroad for the king, and in 1516 was made a privy-councillor. His public life now began. He became so great a favorite with Henry VIII., that, in the words of Erasmus, "the king would scarcely ever suffer the philosopher to quit him." Henry visited him uninvited at Chelsea, and walked with him by the hour in his garden, "holding his arm about his neck." Yet M. had a true insight into Henry's character, for being congratulated on the king's favor by his son-in-law, Roper, he replied: "If my head would win him a castle in France, when there was war between us, it should not fail to go." M. is the first person in British history distinguished by the faculty of public speaking, and remarkable for the successful employment of it in parliament against a lavish grant of money to the crown. Being elected Speaker of the House of Commons in 1523, he vindicated the ancient liberties and privileges of the house against Cardinal Wolsey, who rather feared than liked him. In 1529, when the prosecution was opened against Wolsey, the king delivered the Great Seal to M. at Greenwich, constituting him Lord Chancellor, a dignity that had generally been held by ecclesiastics, and had never yet been filled by a common lawyer. When he was seated in his Court of Chancery, his father, Sir John More, who was nearly ninety, was the oldest judge of the King's Bench. It was a beautiful spectacle to "see the son ask the blessing of the father every day upon his knees, before he sat upon his own seat." Unlike the haughty Wolsey, whom no suitor could approach without offerings, M. sat daily in an open hall, that he might receive in person the petitions of the poor. He despatched the causes so speedily and diligently, that on asking for the next, he was told that none remained. Henry in vain endeavored to obtain M.'s authority for his divorce with Catharine of Aragon, and his marriage with Anne Boleyn, upon which he had set his heart. As soon as the progress of the marriage was so far advanced that the active co-operation of a chancellor was required, M. obtained leave to resign the great seal. When the king "by no gentleness could win him," his favor turned to fury. M. refused to take an oath which pledged him to the lawfulness of the king's marriage with Anne Boleyn. He was committed to the Tower, where he remained thirteen months. On the 6th of May 1535, he was brought to trial at Westminster. It has been truly said that "no such culprit had stood at any European bar for a thousand years." He was convicted by the most flagrant perjury and injustice, and sentenced to the savage punishment for high treason. He suffered death in the Tower, July 6, 1535. In the words of Addison: "The innocent mirth which had been so conspicuous in his life did not forsake him to the last. When he laid his head on the block, he desired the executioner to wait until he had removed his beard, 'for that had never offended his Highness.'" His head was placed on London Bridge, but was taken down and preserved by his favorite daughter, the admirable Margaret Roper, the story of whose tenderness and devotion will live as long as the English language endures. His "Utopia" is the conception of an imaginary commonwealth, in which opinions are expressed of great boldness and originality, and especially favorable to freedom of inquiry, even in religion. He, however, wrote against the Lutherans, and corrected the MS. of Henry's answer to Luther. The terseness and liveliness of his sayings,

his sweet temper and affectionate disposition, his blameless life, his learning and probity, combine to make a union of perfect simplicity with moral and intellectual greatness, which will for ever endear his memory to his countrymen of every sect and party.

MORE, Hannah, the daughter of a village schoolmaster, near Bristol, was born in 1745. She wrote verse at an early age; and in 1778, she published a pastoral drama entitled "The Search after Happiness;" and the year after, her tragedy of "Regulus." Under the idea that she was possessed of dramatic talent, she was introduced to Garrick, and through him became acquainted with Dr Johnson, Burke, and Sir Joshua Reynolds. Deeply impressed with the importance of religion, she gradually resigned her ambition to shine as a writer for the stage, and after the publication of her "Sacred Dramas," she retired to the country, and busied herself with the composition of works of a more serious and practical cast, the best remembered of which are, "Cecilia in Search of a Wife," and "The Shepherd of Salisbury Plain." She died at Clifton, on September 7, 1833. Her "Memoirs and Correspondence" were published in the following year, in four volumes.

MOREA, the name borne by the ancient Peloponnesus (q. v.) since the middle ages, if not from as early a period as the 4th century. It is usually said to be derived from *morua*, a mulberry—the outline of the peninsula bearing a resemblance to the leaf of that tree; others, however, such as Fallmerayer, trace it back to the Slavic word *morr*, the sea, which nearly encircles the Morea. The M. forms the most southern part of the kingdom of Greece, and is divided into the nomarchies of Argolis, Corinth, Laconia, Messenia, Arcadia, Achaia, and Elia.

Overrun by the Goths and Vandals, it became a prey in the second half of the 8th c. to bands of Slavic invaders, who found it wasted by war and pestilence. Gradually, however, these barbarians were subdued and Grecianised by the Byzantine emperors. Nevertheless, the numerous names of places, rivers, &c., in the M. of Slavic origin, prove how firmly they had rooted themselves, and that the Moreotes are anything but pure Greeks. In 1207, the peninsula was conquered by French knights, and Achaia was formed into a principality with all the feudal institutions of the west. After 1261, the Byzantine emperor, Michael VIII. Palæologus, reconquered part of the country; but the principality of Achaia remained in the family of Villehardouin till 1346, when the male line became extinct. Various claimants now arose, and much strife and confusion ensued. At length, in 1460, the greater portion of the M. fell into the hands of the Turks, who retained possession of it down to the period of the Greek revolution, except from 1657 to 1715, when it was held by the Venetians. The long struggle between the Turks and Venetians diminished the population so much that in 1719 it had only 200,000 inhabitants, and the plagues of 1756 and 1782 even reduced it to half this number. After the French Revolution, however, it began to increase; at the outbreak of the War of Independence, in 1827, it had reached 300,000, of whom only one-sixth were Turks; and in 1870, it was 645,889.

MOREAU, Jean Victor, the greatest general of the French Republic, except Bonaparte, was born, 11th August, 1763, at Morlaix, in Bretagne; was the son of an advocate, and was sent to study law at Rennes. He took the side of the Revolution, was chosen to command the battalion of volunteers from Rennes, served under Dumas in 1793, and displayed such military talent, that in 1794 he was made a general of division. His father was put to death by the guillotine under the Reign of Terror, and M. hesitated for a moment, but resolved that he could not withdraw from the service of his country. When Pichegru fell under suspicion, the Directory appointed M. in the spring of 1796, to the chief command on the Rhine and Moselle. He crossed the Rhine at Kehl, defeated Latour at Rastadt, and the Archduke Charles at Ettlingen, and drove the Austrians back to the Danube. But, owing to errors in the plan of the campaign against which he had in vain remonstrated with the Directory, M. found himself in danger of being cut off from the Rhine, and was obliged to make a desperate effort to regain that river, which he accomplished, notwithstanding great difficulties, by a march of forty days. This retreat established his reputation for generalship more than all his previous victories.

A suspicion of participation in the plots of Pichegru led to his being deprived of his command after the *coup d'état* of 18th Fructidor. In the following year he succeeded Schérer in the command of the army in Italy, when it was hard pressed by the

Morecambe  
Morgan

250

Russians and Austrians, 25,000 men being opposed to 80,000. By a retreat conducted with consummate skill, and in course of which he even gained victories, he saved the French army from destruction. The Directory, nevertheless, deprived him of the chief command, and gave it to Joubert. But M. remained with the army, and aided that young general to the utmost; and after his death at Novi, again assumed the command, and conducted the defeated troops to France. The noble disinterestedness of M.'s character, his military talent, and his political moderation, induced the party which overthrew the Directory, to offer him the dictatorship of France, which he declined, and lent his assistance to Bonaparte on the 18th Brumaire. Receiving the command of the army of the Rhine, M. gained victory after victory over the Austrians in the campaign of 1800, and at last won the great and decisive battle of Hohenlinden (q. v.). A strong feeling of mutual distrust now arose between M. and Bonaparte, who sought in vain to win him to himself; and M.'s country-seat, to which he retired, became the gathering place of the discontented. Bonaparte surrounded him with spies, and ere long he was accused of participation in the plot of Cadoudal (q. v.) and Pichegru against the life of the First Consul. He was arrested, brought to trial, and found guilty on 10th June 1804, although the evidence against him was utterly insufficient. But Bonaparte could not venture upon a sentence of death, and a sentence of two years' imprisonment was therefore pronounced, which was commuted into banishment, and M. went to America, where he settled in New Jersey. Regarding with great dissatisfaction the whole of Bonaparte's further career, he thought it his duty to France to give his aid to the allies in the campaign of 1813, and leaving the United States in the company of a Russian agent, he landed at Gothenburg, had an interview with the Crown Prince of Sweden, the former General Bernadotte, and accompanied the emperor of Russia and the king of Prussia in the march against Dresden, where, as he stood with the Emperor Alexander on a height at Racznitz, on 27th August, a French cannon ball broke both his legs. Amputation was performed, but he died at Laun in Bohemia, 2d September 1813.

**MO'RECAMBE BAY**, an inlet of the Irish Sea, on the north-west coast of England, separates the main portion of Lancashire from the detached portion of Furness. It is about 10 miles in average breadth, and is 16 miles in length. It receives the Kent, the Keer, and the Lune. The depth of water in the bay is never great except in the channels of the rivers; and when the tide is out, the water entirely withdraws for the time, and there is a road, although a dangerous one, across the sands from the vicinity of Lancaster into Furness.

**MORE'N.** See **MOIRE**.

**MORE'L** (*Morchella*), a genus of fungi, of the division *Hymenomycetes*, having a statural stalk, and a roundish or conical *pileus*, the upper surface of which is divided into an irregular net-work of cells or pits, and bears the *hymenium*. They grow on the ground, and have a more or less agreeable smell and taste. Some of them are reckoned among excellent fungi, of which the best known is the **COMMON M.** (*M. esculenta*), a fungus rare in Britain, but common in many parts of the middle and south of Europe. Its stalk is only about an inch high, and it has a roundish, oval, oblong, or conical, yellowish or brown pileus. It is nutritious, and not difficult of digestion; but is chiefly used in sauces and gravies, on account of its pleasant flavor. It is used either fresh or dried, and is often brought to market in a dried state. It grows in lawns, and among fallen leaves in the thinner parts of woods where the soil is light, and makes its appearance in spring. It makes excellent ketchup. In Germany, the *M.* is highly prized, and as it very often springs up when part of a forest has been burned, the forests of Germany were often destroyed for its sake, till this practice was restrained by severe penalties. Its cultivation has not been attempted, although probably it would not be difficult.—A very similar species is *M. patula*, which is used in the same way; as is also the **BOHEMIAN M.** (*M. Bohemica*), which has a stem 4—8 inches high, and a thimble-shaped, obtuse, white-margined pileus, with longish narrow pits of many various forms; abundant in Bohemia, and when dried in a baker's oven, a considerable article of export. The name *M. (Morchel)* is extended in Germany to some of the edible species of *Helvella* (q. v.).

**MORE'LIA**, or Valladolid, a town of Mexico, capital of the state of Michoacan, in a fine valley, surrounded by high mountains, 125 miles west-north-west of Mexico.

There is a magnificent aqueduct for the supply of water. It was the birthplace of Iturbide, the short-lived emperor of Mexico. Pop. 25,000.

**MORELLA** (anc. *Castra Elicia*, the winter-quarters of Sertorius), a town and important fortress of Spain, in the province of Castellon, about 80 miles north of Valencia. M. was the chief stronghold of Cabrera, who scaled the castle by ropes furnished by a partisan within, on the night of the 25th January 1838. It was retaken in 1840 by Espartero, after a brave defence. There are some interesting Roman and Moorish antiquities. Pop. 6800.

**MORESCUE.** See **ARABESQUE**, **GROTESQUE**.

**MORETON BAY**, on the east coast of Queensland, Australia, is formed inside the islands of Moreton and Stradbroke, the former 23 miles, and the latter 35 miles in length, and both about 5 miles in greatest breadth. It is 65 miles in length (lat. 27°-37° S.) by 23 miles in greatest breadth. Its shores are rich in soil, and admirably adapted for agriculture. Its appearance is rendered picturesque and beautiful by the numerous islets, some of them capable of profitable cultivation, with which it is dotted over. Into this bay five navigable rivers, the Arrowsmith, Logan, Brisbane, Pine, and Caboolture pour their waters. The entrance at the north end is practicable at all times for vessels of the largest size; the entrance between Moreton and Stradbroke is narrow, and less safe.

**MORETON-BAY CHESTNUT** (*Castanospermum Australe*), a tree of the natural order *Leguminosae*, sub-order *Papilionaceae*, a native of Queensland, Australia. It attains a height of 70-100 feet, has wide-spreading branches, pinnate leaves, and large racemes of beautiful red and yellow flowers. The pods are six or seven inches in length, and the seeds are in size and quality somewhat like chestnuts.

**MORGAN, Lady** (Sydney), was the daughter of a theatrical manager, named Owens, who settled in Dublin. It is usually stated that she was born in 1786, but as she refuses to tell the date of her birth, "because dates are so cold, false, and erroneous," the reader of her autobiography will do well to add about ten years to her age. Her father fell into pecuniary difficulties, and the clever, bold, and lively young woman resolved to support the fortunes of the family, first as governess, and then as author. She wrote "The Wild Irish Girl" in 1806. A lady novelist was then rare, and Irish subjects were less hackneyed than they have since become. Sydney Owens obtained a footing in the household of the Marquis of Abercorn, in whose establishment her future husband, Dr Morgan, held the post of private physician. The Lord Lieutenant was persuaded to make a knight of Dr Morgan, and the newly wedded pair set up for themselves in Dublin. Here she wrote the "O'Donnel." The opening of the continent in 1814 attracted the Morgans to Paris. Lady M. obtained admission into the highest society, corresponded with several celebrities, and wrote a work on "France," which was eagerly received, and vehemently praised and censured by critics of different political opinions. In 1816, the Morgans went to Italy—the wife to sketch manners, scenery, and society, while Sir Charles was to contribute chapters on politics, science, and education. Lady M. was received with great hospitality by the Italian nobility, and the foreign visitors at Rome. Her "Italy" appeared in 1821, and proved one of the most successful and remunerative of her works. In 1824, the Morgans came to London, and in 1825, Lady M. began to keep a diary, which contains some amusing bits of literary, fashionable, and political gossip. Her reputation as an authoress became obscured, but she continued to the end of her career to assume the twofold character of the lady of fashion and the woman of genius. She succeeded in obtaining from the Whig government a pension of £300 a year, in acknowledgment of her literary merits, and partly, also, in recognition of the unjust and virulent attacks to which she had been subjected for having, in her earlier works, exposed the wrongs of her native country. She died in 1869, having continued busy with her pen and her tongue to the last; and leaving behind a great mass of correspondence of little intrinsic value and interest, which, with a memoir, her autobiography, and diary, was published in 1892, in 2 vols. Her descriptions of high life have much raciness and vigor, and her Irish sketches—the famous "Jug-day," in "The O'Briens and the O'Flahertys," deserving special mention—are perhaps the best account of that rascally, humorous, senti-

Morganatic

mental existence which was at once the charm and bane of Ireland, and which has but lately passed away.

**MORGANATIC MARRIAGE** (Goth. *morggan*, to curtail, limit), sometimes called *Left-handed marriage*, a lower sort of matrimonial union, which, as a civil engagement, is completely binding, but fails to confer on the wife the title or fortune of her husband, and on the children the full status of legitimacy or right of succession. The members of the German princely houses have for centuries been in the practice of entering into marriages of this kind with their inferiors in rank. Out of this usage has gradually sprung a code of matrimonial law, by which the union of princes with persons of lower rank, in other than morganatic form, involves serious consequences, especially towards the lady. The penalty of death was actually enforced in the case of the beautiful and unfortunate Agnes Bernauer (q. v.). In the 16th and 17th centuries, a fashion began among German princes of taking a morganatic wife in addition to one who enjoyed the complete matrimonial status—Landgrave Philip of Hesse setting the example, with a very qualified disapprobation on the part of the leading reformers. An energetic attempt was made in the first half of the last century by Anton Ulrich, Duke of Saxe-Meiningen, to upset the established practice, and obtain for his morganatic wife the rank of duchess, and for her children the right of succession. In deference to the united opposition of the whole principedom of Germany, the emperor refused the duke's suit, declaring that there could be no marriage in princely families without "*Ebenbürtigkeit*," or equality of birth. In the present century, morganatic marriages are by no means on the decline among the German reigning houses—one of the best known and most remarkable instances being the union of the late Archduke John, the "*Reichsverweser*" of 1848, with the daughter of the postmaster of Aussee, in Styria, afterwards created Countess of Meran. Morganatic marriages are recognised not only among the princely families, but among the higher aristocracy of the empire; and in Prussia, even the "*Niedere Adel*," or inferior gentry, may contract unions of this kind. A sort of left-handed or "*hand-fasted*" marriage was recognised in early times in the Highlands of Scotland, and Ireland: the hand-fasted bride could be put away, and a fresh union formed, with the full status of matrimony. Unlike the case of German morganatic marriages, the issue were often accounted legitimate, even to the prejudice of the children of the more regular union that followed. The Royal Marriage Act, 12 Geo. III. c. 11, reduces to a position somewhat like that of morganatic unions every marriage in the royal family of Great Britain not previously approved by the sovereign under the Great Seal, provided the prince entering into it is under 25, and every such marriage of a prince above 25 which is disapproved by parliament.

**MORGA'RTEN**, a mountain slope on the east margin of Lake Egeri, in the canton of Zug, Switzerland, has acquired a world-wide celebrity as the scene of a great victory won by the Swiss Forest Cantons over the Austrians, November 15, 1815. The Swiss, who had command both of the narrow pass which wound between Morgarten Hill and the lake, and of the adjoining heights, numbered only 1400 men, while the Austrians amounted to 15,000, and were led by Duke Leopold, brother of the German Emperor. When the Austrian troops had fairly entered the pass, those of the Swiss posted on the rocks above hurled down great masses of stone, which threw the enemy's cavalry into confusion, besides killing immense numbers of them. Their comrades who held the pass, taking advantage of the disorder, now charged the Austrians repeatedly, and utterly routed them. Only a few escaped, among whom was Duke Leopold himself.

**MORGHEN**, Raphael Sanzio Cavallere, a famous engraver, was born at Florence, June 19, 1758. His first instructor in the art of engraving was his father, who, according to some, was a German, or the son of a German. The indications of talent that he gave were such as to induce his father to place him under Volpato at Rome. His progress then became very marked. Raphael's celebrated figures in the Vatican of "*Poetry*" and "*Theology*," were engraved by him in 1781; and he afterwards produced a succession of engravings of a very high class from many of the master-pieces of art: amongst these may be enumerated his prints from Raphael's "*Madonna della Seggiola*;" "*the Madonna del Sacco*," by Andrea del Sarto; the "*Transfiguration*," by Raphael; the "*Duke of Moncada*," by Van Dyck;

and by his *Barin*, Da Vinci's "Last Supper," notwithstanding its decay, has been rendered with such consummate skill, as to lessen the regret felt for the evanescent condition of the original work. He accepted an invitation from the Grand Duke to reside at Florence, with a pension of 400 scudi, and a free residence, under condition of keeping a public school; and received marked attentions from the Emperor Napoleon, to whom he dedicated his engraving from the "Transfiguration." M. died at Florence on 8th April 1833. He had married a daughter of Volpato's in 1781. His *Life*, with a portrait, and a catalogue of his works, was published by his pupil, Niccolò Palmarino. From this work, it appears that he has engraved 78 portraits, 47 religious, and 44 historical and mythological pieces, 24 views and landscapes, and 13 vignettes, crests, &c.—201 in all. The works of M. will always hold a very prominent place in the history of engraving. About the middle of last century, Strange had added a new feature to the art, by introducing, in a remarkable way, what is technically called by engravers "color," or the art of producing by management and variety of line, a texture or quality that compensates to some extent for the want of the actual colors in a picture. This influenced the style of Volpato, Cunego, and other Italian engravers of the period, who imitated, though with no very great success, the brilliancy produced by Strange. M., however, went far beyond these Italian engravers, for in his works he united much that was good in the engravings of Strange with a more correct and purer style of drawing, and thus brought out in a very high degree all the important qualities for which those master-pieces he so skilfully rendered, are distinguished.

**MORGUE**, a French word, denoting the inner wicket of a prison, at which persons accused or condemned are kept for some time, in order that the jailers and turnkeys may examine them at their leisure, so as to be able to recognise them when occasion requires. Hence the application of the word to a certain building (*La Morgue*) in the "City" (*La Cité*) of Paris, situated on the *Quai du Marché neuf*, where the dead bodies of persons unknown, found either in the river (Seine) or in the streets, are exposed to public view for three days. The corpses are put under a glass case, on a sloping slab of black marble. They are wholly naked, except across the middle, which is covered with a piece of leather. The clothes are hung on the wall above. When a corpse is recognised, it is handed over to the relatives or friends of the deceased, on payment of costs and dues—otherwise, it is interred at the expense of the city. The number of bodies yearly exposed in the *Morgue* is about 800, of which five-sixths are those of males.

**MO'RION**, an iron or steel head-piece worn by a man-at-arms in the days when armor was used. It was distinguished from the helmets of the knights and esquires in having neither visor nor beaver. Under the Norman laws, every yeoman between certain ages was bound to keep his morion ready for service.

**MORISON**, Robert, M.D., one of the most eminent botanists of the 17th c., was a native of Aberdeen, and having borne arms as a royalist in the civil wars, retired to France about 1650, and became superintendent of the garden formed at Blois by Gaston, Duke of Orleans. After the Restoration, he was appointed by Charles II. one of his physicians, and "botanist royal," and became Professor of Botany at Oxford. He died in 1693. His great work is "*Plantarum Historia Universalis Oxoniensis*" (2 vols., 1676—1699). He also wrote on umbelliferous plants.

**MORISONIANISM**, a name freely used to designate the distinctive tenets of the Evangelical Union (q. v.), but never accepted by that religious body. The system of doctrine so designated is fully enunciated in an authoritative document entitled "Doctrinal Declaration," which was issued by the Evangelical Union Conference of 1868—not as a fixed creed, but as a testimony to their distinctive faith. Being a recoil from the dominant Calvinism, of Scotland, it is of the Arminian type, but without any latitudinarian savor. The charge of Pelagianism often urged against it is indignantly repudiated by Evangelical Unionists, and, with reference to some modern aspects of Calvinism, is by them spiritedly retorted. It is a form of doctrine, in fact, which very nearly corresponds to that type of Evangelical Arminianism which obtains among the Wesleyans. Like that, it originated in an element of revival; and now, after the lapse of a generation, these same tenets are largely insisted on by revival preachers of the orthodox bodies at the present day. This coincidence is explained by the felt need, in all efforts to bring men to religious

Moriaix  
Mormons

254

decision, to give prominence to the universalities of gospel grace, the duty of immediate faith, and the importance of peace with God as a subjective condition of the Christian life. It was these, and especially the doctrine that Christ died as an atonement in the same plenary sense for all men, which led to the separation, in 1841, of the Rev James Morison of Kilmarnock (now Dr Morison of Glasgow) from the United Secession Church, and of other three ministers at subsequent synods, and to the formation by them of the Evangelical Union in May 1843. A Theological Academy was at the same time instituted, presided over by Dr Morison, at which from twenty to thirty students annually receive training for the ministry. Many of these have gone to England, and some have attained good positions among the Nonconformists there. The Evangelical Union now embraces about fourscore ministers and churches, all Independent in polity, but many having ruling elders. In brief, the most distinctive doctrine of Evangelical Unionists is that which they prominently exhibit as the three great universalities of gospel grace—namely, the Divine Father loves all, the Divine Saviour died for all, the Divine Spirit strives for the salvation of all. Believing in the entire freedom of the human will, they hold predestination to be conditional. On such cardinal doctrines as the Trinity, Atonement, Justification, and the like, they symbolise with other bodies known as Evangelical.

**MORLAIX**, a seaport of France, in the dep. of Finistère, 45 miles north-northeast of Quimper. Vessels of 400 tons can reach the quays of the town. Pop. (1876) 13,519.

**MO'RMONS**,\* or, as they call themselves, **THE CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS**, are a religious sect founded by a native of the United States named Joseph Smith. Smith was the son of a farmer, and was born in the town of Sharon, Windsor County, Vermont, 23d December, 1805. When he had reached the age of ten, his parents removed to Palmyra, in the state of New York, and four years later, to the town of Manchester, about six miles off. The reputation of the family is said to have been of the worst kind; we are told that they avoided honest labor, were intemperate, untruthful, and suspected of sheep-stealing and other offences. These accusations are generally denied by M., but Smith himself partly admitted them, affirming that he "had never done anything so bad as was reported of King David, the man according to God's own heart." Nevertheless, a rude sensual religiosity appears to have been mixed up with his more carnal conduct. There is the most satisfactory evidence—that of his enemies—to shew that from an early period he was regarded as a visionary and a fanatic. This fact is of the utmost importance as affording a clue to his *real* character, and an explanation of that otherwise unaccountable tenacity of purpose and moral heroism displayed in the midst of fierce persecution. A mere impostor—i.e., a person who did not, in some sense or other, partly believe in his own mission, but who, on the contrary, felt that he was simply the liar and cheat that people called him—would have broken down under such a tempest of opposition and hate as Smith's preaching excited.

"When about fourteen years of age," Smith says, "I began to reflect upon the importance of being prepared for a future state." He then describes how he went from one religious denomination to another, but could find nothing satisfactory—nothing but "a great *dash* in religious sentiment." Then he began to withdraw into secret places, to spend hours in prayer and meditation, and to receive angelic visits. The second of these happened on the evening of the 21st September 1823, when it seemed as though the house was filled with "consuming fire." In a moment, a "personage" stood before him "with a countenance like lightning," and "visible to the extremities of the body," who "proclaimed himself to be an angel of God." He informed Smith of various important particulars, as, "that his sins were forgiven, and his prayers heard; that the covenant which God made with ancient Israel was at hand to be fulfilled; that the preparatory work for the Second Coming of the Messiah was speedily to commence; that the time was at hand for the Gospel to be preached in its power and fulness to all the nations; and that Smith was chosen to be an instrument in the hands of God, to bring about some of his purposes in this glorious dispensation." Besides all this, the angel gave him,

\* The origin of this name will appear in the sequel.

by way of appendix, "a brief sketch of the origin, progress, civilisation, laws, and governments" of the aboriginal inhabitants of America—"of their righteousness and iniquity; and the blessings of God being finally withdrawn from them." He was also informed where some plates were deposited, containing an abridgment of the records of the ancient prophets that had existed on the American continent. The angel appeared to Smith thrice that night, and afterwards paid him many visits. He told him where the records were deposited, "on the west side of a hill, not far from the top, about four miles from Palmyra, in the county of Ontario, and near the mail-road, which leads thence to the little town of Manchester." He advised him to go and view them, which Smith did; but the prophet was not yet holy enough to obtain possession of them.

At length, after due disciplinary probation, the angel of the Lord, on the 22d of September 1827, placed in Smith's hands the wonderful records. They were engraved on plates nearly eight inches long by seven wide, a little thinner than ordinary tin, and bound together by three rings running through the whole. The volume was altogether about six inches in thickness, a part of which was sealed. The characters, letters, or hieroglyphics upon the unsealed part were small, and beautifully engraved. They represented an unknown language called the "Reformed Egyptian." Along with the records was found a curious instrument, called by Smith "Urim and Thummim," consisting of two transparent stones, set in the rim on a bow fastened to a breastplate. By means of these stone spectacles, God enabled him to understand and translate the ancient records into such humble English as the "prophet" (who had received almost no school-education, and could read with difficulty) was master of. The records contain the primitive history of America, from its first settlement by a colony that came from the Tower of Babel, at the confusion of languages, to the beginning of the 5th c. of the Christian era. These primitive colonists were called Jaredites; they were a wicked and bloody race, and finally, like the Kilkenny cats, mutually destroyed each other, millions being slaughtered in the final conflicts. Silence again settled down upon America. But a new race came directly from Jerusalem about 600 B.C. These consisted of Lehi and his wife; his four sons, Laman, Lemuel, Sam, and Nephi, together with their four wives; two "sons of Ishmael," and their two wives; Zoram, a servant, and his wife; in all, sixteen men and women. They are supposed to have landed on the coast of Chili. After the death of Lehi, quarrels broke out among the brothers. The Lord had appointed Nephi to be the ruler of the new race of colonists, but his elder brothers would not hear of it; as a punishment for which, they and all their posterity were condemned to have dark skins, and "to become an idle people, full of mischief and subtlety, which did seek in the wilderness for beasts of prey." They are the ancestors of the American Indians, who are thus, according to Smith's records, simply *bad Hebrews*. The descendants both of Nephi and of his rebellious brothers, increased and multiplied, but were almost continually at war with each other. In the time of Nephi the second, an awful earthquake announced the Crucifixion. Three days afterward, Christ himself appeared out of heaven; shewed the Nephites his wounded side and the print of the nails; instructed them for forty days in the truths of Christianity; healed the sick, blessed children, administered the sacrament, and planted churches, with apostles, prophets, pastors, teachers, and evangelists—the same order, the same priesthood, the same ordinances, gifts, powers, and blessing as was enjoyed on the eastern continent. Hostilities, however, between the Nephites and their dark-skinned brethren continued to rage as fiercely as ever; gradually the purity of their faith declined; and finally, in 384 A.D., a decisive conflict took place at the hill Cumorah, in Western New York, where the Christian Nephites were nearly annihilated; miracles now ceased, and unbelief gradually became supreme. Shortly before this, however, a prophet called *Mormon* had been commissioned by God to write an abridgment of all their prophecies, histories, &c., and to hide it in the earth, till God should see fit to bring it forth, and "unite it with the Bible for the accomplishment of his purposes in the last days." This is the famous *BOOK OF MORMON*, believed by the followers of Smith (hence called *MORMONS* and *MORMONITES*), to be of equal authority with the Jewish and Christian Scriptures, and to form an indispensable supplement to them, containing God's revelations to the New, as the others to the Old World.

In 420 A.D., they were finally sealed up where Smith found them, by Moroni, one of the few survivors of the battle of Cumorah.

The way in which Smith translated was as follows: he sat behind a blanket hung across the room to keep the sacred records from profane eyes, and read off by the help of his "Urim and Thummim," to one Oliver Cowdery, who wrote down what the invisible "prophet" gave as a translation—Smith himself being, as he confesses, but a "poor writer." A farmer, of the name of Martin Harris, supplied Smith with the necessary funds to get the work printed. The "Book of Mormon" finally appeared before the world in 1830, with the names of Oliver Cowdery, Martin Harris, and David Whitmer appended to a statement, that an angel of God had come down from heaven and shewn them the original plates. This was immediately followed up by the testimony of eight other witnesses, among whom were Smith's own father and two brothers (suspected, however, it must not be forgotten, of being addicted to sheep-stealing and other nefarious practices), who affirmed that "Joseph Smith, junior," had shewn them the mysterious plates. These, however, are the only persons who have been so privileged. No other human being has ever seen them. Like Macpherson's Ossianic MSS., they have never been forthcoming, however loudly demanded, and of late years, all knowledge of them has become traditional.

Attention was soon drawn to the newly published work, and a controversy sprung up regarding its real authorship. Evidence was brought forward by the opponents of Smith to shew that with the exception of certain illiterate and ungrammatical interpolations, bearing on religious matters, the so-called "Book of Mormon" was really borrowed or stolen nearly *verbatim* from a MS. romance written by a quondam clergyman named Solomon Spalding, who died in 1816. It is unnecessary to go over the arguments *pro* and *con*. Suffice it to say, that *anti*-Mormons generally think them conclusive; while the "Saints" consider the whole story of Spalding's MS. romance a scandalous fabrication. About 1829 Smith became acquainted with one Sidney Rigdon, originally a compositor and preacher, but who by this time had begun to promulgate a species of incipient Mormonism, and had managed to found a little sect of his own. It is conjectured by the opponents of Mormonism that Rigdon (into whose hands Spalding's romance is supposed to have fallen for some time) gave it to his new associate to further his purposes, and that the latter—in whose soul there may have been (according to our theory of his character) some rude and gross religious notions and feelings—devised the ungrammatical interpolations. This theory acquires some probability from the fact, that these religious passages do not refer to old-world faiths and the practices of an ancient ritual, but to quite modern questions, such, we are told, as were rife in the villages of Western New York about 1830. Calvinism, Universalism, Methodism, Millenarianism, Roman Catholicism, are discussed, if not in name, yet in reality. Infant baptism is condemned; so, strange to say, are polygamy and free-masonry.

Undeterred, nevertheless, by exposure, ridicule, and hostility, Smith and his associates persevered in preaching their "doctrine," which was a new Americanised phase of millenarianism. They declared that the millennium was close at hand, that the Indians were soon to be converted, and that the New Jerusalem—the final gathering-place of the Saints—was to be somewhere in the heart of the American continent. The "prophet's" house "was frequently beset by mobs, and evil-designing persons; several times he was shot at, and very narrowly escaped;" but his fearless courage continued to bring him disciples; and on April 6, 1830, the *Church of Jesus Christ of Latter-day Saints* was first organised in the town of Manchester, state of New York. Smith was fiercely attacked by the leaders and preachers of the other religious denominations, but he kept his ground stubbornly, argued pretty well, and when argument failed, had recourse to a style of zealous prophetic asseveration, which is generally irresistible with weak and ignorant people. If the orthodox preachers, however, could not baffle him in speech, they knew how to inflame their hearers with the most ferocious animosity against the new sect; and in January 1831, Smith and his followers considered it prudent to remove to a distant part of the country. They established themselves at Kirtland, in Ohio, which was to be the seat of the New Jerusalem. They now made immense progress. Their missionaries were full of zeal (none more so, however, than Smith himself), converts were made in great numbers, and churches

were established in the states of Ohio, Pennsylvania, New York, Indiana, Illinois, &c. Still the eyes of the new sect turned westward—to the region of the great prairies, where they might be allowed to work out their system in peace and freedom. In the autumn of 1831, a colony was established in Jackson County, Missouri, which a "revelation" given to Smith assured the Saints was "the land of promise and the place for the city of Zion." Land was largely bought; preaching was vigorously carried on, a printing-press was established, a monthly periodical, "The Morning and Evening Star," and a weekly newspaper, "The Upper Missouri Advertiser," were started to propagate the doctrines of the new sect; everywhere was visible a spirit of industry, sobriety, order, and cleanliness. It is only fair to the M. to state these things. Account for it how we may, they were, in many important respects, morally, socially, and industrially, far in advance of their neighbors. When Smith returned to Kirtland, he set up a mill, a store, and a bank, and continued his propagandist labors with great success, but not without savage persecution; thus, for example, on the night of March 22, 1832, a mob of Methodists, Baptists, Campbellites, and other miscellaneous zealots, broke into the prophet's house, tore him from his wife's arms, hurried him into an adjoining meadow, and tarred and feathered him! Sidney Rigdon was similarly handled, and rendered temporarily insane. Smith, however, undaunted by this brutal treatment, preached next day with his "flesh all scarified and defaced," and proved the folly of persecution by baptising three new converts in the afternoon. Meanwhile, the brethren in Missouri continued to prosper, but this very circumstance deepened the animosity towards them of all who were not Mormons. Whispers also began to be spread about their indulging in a community of wives. The rumor was not true, but it probably originated in Rigdon's theory of the "spiritual wife," which Smith at first denounced, but afterwards accepted, and thereafter commenced "sealing wives" to himself in some mysterious way that Gentiles cannot yet fathom. This first step towards polygamy, a doctrine not yet revealed, however (in fact, *contrary* to the "revealed doctrine" on the subject), materially helped to inflame the hostility of the impulsive and unscrupulous backwoodsmen. Secret societies (according to Smith, composed "of the basest of men") were formed to expel the M. from Missouri; their periodicals were stopped, their printing-press confiscated, their bishops tarred and feathered, and numberless other outrages were committed. Finally, the hapless "Saints" were compelled to flee across the Missouri River, and men, women, and children had to encamp in the open wilderness on a winter-night in 1833. They subsequently settled in Clay County, in the same state, where they remained upwards of three years. In July, 1834, they were visited by the "prophet" himself, accompanied by 100 persons, mostly young men, and nearly all priests, deacons, teachers, and officers of the church. During a brief residence of one week among them, he accomplished much in the way of vigorous organisation; next year, 1835, a further step was taken in the development of a hierarchy by the institution of a body of apostles—twelve in number—who were sent out to preach the new doctrines among the Gentiles. One of these twelve was the famous Brigham Young, who had become a convert about the close of 1832, and had soon shewn himself to be a man of wonderful sagacity and force of character. He was ordered down east among the Yankees, and made numerous converts even among this acute people. In 1837, Orson Hyde and Heber C. Kimball were despatched as missionaries to England, where they received large accessions to their numbers, especially from the masses in the great manufacturing and commercial towns, Manchester, Liverpool, Leeds, Birmingham, Glasgow, and, above all, from the mining districts of South Wales, where Mormonism, in some places, almost competed for popularity with Methodism itself. Since then, they have extended their strange evangelisation to the East Indies, Australia, the islands of the Pacific, Egypt, Palestine, Turkey, and almost every country on the continent of Europe.

About the close of 1837, or the beginning of 1838, the bank at Kirtland stopped payment, and proceedings were taken against the prophet and others for swindling. Luckily, just at this moment, he received a "revelation" to depart into Missouri, which he instantly obeyed, with all the more alacrity that internal disorders had painfully manifested themselves in the new colony. These were at last healed;

but the conflict between the Saints and the other Missourians became fiercer, more envenomed, more sanguinary than ever, assuming, in fact, almost the proportions of a civil war. The prophet and Rigdon were thrown into prison, and finally, towards the close of 1838, the whole body of Saints, about 15,000, quitted Missouri, and took refuge in Illinois. Here they obtained a grant of land in the vicinity of the little town of Commerce, a name which the M., in obedience to a "revelation" given to Smith, changed to Nauvoo, or The City of Beauty. The country was a mere wilderness when the M. settled in it: it soon began to rejoice and blossom as the rose. Lieutenant Gunnison (a most intelligent and impartial writer) is forced by facts to be eloquent in praise of Mormon industry, and gives us a perfectly enchanting picture of the new colony. The legislature of Illinois granted a charter to Nauvoo; a body of Mormon militia was formed, under the name of the Nauvoo Legion, of which the prophet was appointed commander; he was also appointed mayor of the city, and was thus supreme in all matters civil and military, as well as religious. But the doctrine of "sealing wives" once more roused the wrath of the neighborhood, and serious disturbances took place, the ultimate result of which was that the prophet and his brother Hyram were thrown into prison at Carthage. After a short time, it began to be rumored that the governor of the state was desirous of letting the two Smiths escape, whereupon a band of "roughs," about 200 in number, broke into the jail, 27th June 1844, and shot them. Disastrous as this termination of his career was to Smith himself, there cannot be the shadow of a doubt that it was a most fortunate thing for the system which he founded. "The blood of the martyrs is the seed of the church." A halo of solemn and tender glory now encircles the memory of one who stood greatly in need of this spiritual transfiguration. It may here be stated that it cannot be shewn that Smith was a polygamist, in our sense of the word. Years after his death, Brigham Young produced a paper which he said was a copy of a "revelation" made to Joseph at Nauvoo, commanding him to take as many wives as God should give him. But it was not till August 29, 1852, at a public meeting held in the Salt Lake City, that the "revelation" was formally received.

Smith's death created great agitation and confusion among his followers. Sidney Rigdon and others aspired to succeed him, but the Council of the Twelve Apostles unanimously elected Brigham Young, and events have shewn the wisdom of their choice. The legislature of Illinois having revoked, in 1845, the charter given to the city of Nauvoo, and the hostility of their neighbors not having in the least abated, the Saints resolved to emigrate far beyond the boundaries of civilization, and to seek a new home amid the solitudes of the Rocky Mountains, where they might pass their lives in unmolested peace. Explorers were sent out to examine the country, and brought back a favorable report of the Great Salt Lake Valley. See **GREAT SALT LAKE, SALT LAKE CITY, and UTAH**. In February 1846, the first emigrants crossed the ice-bound Mississippi, settled for a year in Iowa, and then marched under the strictest discipline across the great wildernesses. Agricultural operations were commenced almost the instant they arrived at the shores of the Salt Lake. The cheerfulness, intelligence, and zeal exhibited on all sides, were truly admirable. The world has never seen swifter, more active, more glad-hearted colonists than these singular "Saints." It would be unfair to shut our eyes to such facts. In judging Mormonism, we must keep them constantly in view, to prevent us from forming mere abstract and theoretical decisions, which will not in the least affect the future of Mormonism. Brigham Young arrived in the Valley, July 24, 1847, and the main body of the M. in the autumn of 1848. The Salt Lake City was soon founded, an emigration fund established, and settlers poured in from all parts of Europe and America; and perhaps a greater amount of physical comfort was enjoyed here than in any other part of the world. In 1850, the government of the United States admitted the region occupied by the M. into the Union as a territory, under the name of **UTAH**, and Brigham Young was appointed governor by President Fillmore. District judges were also appointed by the federal government, but these were looked upon with great suspicion and mistrust by the Saints, who finally drove them out of the country in 1861. Brigham Young was now suspended from his office of governor, and Colonel Steptoe of the United States army was appointed his successor. He arrived in Utah in 1854, but found it prudent after some time to withdraw from the country. During the next two years, the collisions between the United States officers and the Saints became more and more frequent, and in the spring of 1856,

the whole of the former were forced to flee from the territory. A new governor, Alfred Cumming, was appointed by the authorities at Washington in 1857, and also a new superintendent of Indian Affairs; besides, a force of 2500 men was sent to enforce obedience to the laws of the United States. The Saints attacked their supply-trains, and compelled the enemy to winter at some distance from the Salt Lake. In the early part of next year, negotiations were entered into between the contending parties; the M. submitted to the federal authority, and the federal troops were allowed to encamp on the western side of Lake Utah, about forty miles from Salt Lake City, where they remained till 1860, when they withdrew. After the close of the Civil War, the United States seemed determined to insist on its authority. A Federal governor was again appointed, and polygamy was declared in 1871 to be a criminal practice contrary to the laws of the United States; Brigham Young was even arrested. One of the most notable events in the recent history of the M. took place in the year of Brigham Young's death (1877). John D. Lee, a Mormon bishop, was brought to trial and executed for his share in a crime till then uninvestigated. In 1857 a party of M. and Indians, under Lee's command, assaulted a train of 160 non-Mormon emigrants at Mountain Meadows, near Utah, and massacred every soul of them. The complicity of the leaders of the church was not proved, but Lee had been clearly the immediate instigator of the deed.

**Hierarchical Organisation.**—Mormonism is a pure theocracy; its priesthood, who rule in matters temporal and ecclesiastical, are divided into various orders. The highest is the *First Presidency*, composed of three persons, who are the successors of Peter, James, and John in the Gospel Church. Of these, even Brigham Young was nominally only *primus inter pares*. The first presidency is elected by the body of the church, and possesses supreme authority. The second office in point of dignity is that of *Patriarch*, held at present by the nephew of Joseph Smith, whose chief duty is to administer blessings. Then follows the council of "The Twelve," whose functions are of great practical importance. They ordain all other officers, elders, priests, teachers, and deacons; they baptise, administer the sacraments, and take the lead in all meetings. Next come the *Seventies* (of whom there are many). They are under the direction of the "Twelve Apostles"—and are the great propagandists, missionaries, and preachers of the body. The fifth order is that of *High-priests*, composed usually of men advanced in years. Their duty is to officiate in all the offices of the church when there are no higher authorities present. After these come the *Bishops*, who are "overseers" of the church chiefly in secular matters, attending to the registration of births, marriages, and deaths, the support of "literary concerns" (such as newspapers and magazines), home-visiting, the settlement of private grievances, and the care of the poor. Indeed, according to Dixon ("New America," vol. i, p. 260), "a bishop's main function is to see that no man in his ward, in his county, is in want of food and raiment." The duties of the *Elders* are not very precise; they are charged with the conduct of meetings, and exercise a general surveillance over the *Priests*, who correspond to the "fixed ministry" of other sects, i. e., they preach, exhort, and expound the Scriptures. The lowest orders are the *Teachers* and *Deacons*; the former are simply assistants to the priests, elders, and bishops, and act as catechists; the latter are church-collectors, treasurers, &c.—The whole priesthood is divided into two classes, the Melchisedek and the Aaronic. To the first belong the offices of apostle, seventy, patriarch, high-priest, and elder; to the second, those of bishop, priest, teacher, and deacon. The latter can be held only by "literal descendants of Aaron," who are pointed out by special revelation.

**Doctrine.**—The Saints are almost incredibly materialistic in their doctrines. Their Godhead is formed on Buddhist principles. While professing to believe in the Trinity, they explain that God was once a man; who has, however, so advanced in intelligence and power, that he may now be called (comparatively speaking) perfect, infinite, &c., but that he has still the form and figure of a man; he has even "legs," as is evident (says Mr Pratt, "the leading scholar of the Mormon Church") from his appearance to Abraham; though he has this advantage over his creature, that "he can move up or down through the air without using them." Christ is the offspring of the "material" union, on the plains of Palestine, of God and the Virgin Mary—the latter being duly married after betrothal by the angel Gabriel. Yet he is believed to have had a previous existence, to have even made the universe

out of "unformed chaotic matter as old as God," and his worship is enjoined as Lord of all. The Paraclete is vaguely described, but is also material. It would appear, however, that there is an older Trinity, that of "Elohim, Jehovah, and Michael, which is Adam." Adam, again, is declared to be the "god" of Jesus Christ; Jesus Christ, the god of Joseph Smith; and Joseph Smith is now the god of this generation; but the whole affair is a mass of unintelligible rubbish. The human intellect probably never sank into more abysmal nonsense; all that can be definitely set before the mind is, that M. believe that by faith, obedience, holiness, any man may rise into a deity, and acquire the power of making, peopling, and ruling a "world" for ever! The *second* article of the Mormon creed affirms that "men will be punished for their own sins, and not for Adam's transgressions; the *third* article states that "through the atonement of Christ, all mankind may be saved by obedience to the laws and ordinances of the Gospel." The *fourth* article affirms these "ordinances" to be: 1. Faith in the Lord Jesus. 2. Repentance. 3. Baptism. 4. Imposition of hands by the gift of the Holy Spirit. 5. The Lord's Supper, administered kneeling. The Saints, who are much averse to strong drinks, use water instead of wine in the sacrament, which is taken every week. The *fifth* article declares that "men must be called to the work of God by inspiration;" the *sixth*, that the same organisation must now exist that existed in the primitive church; the *seventh*, that miraculous gifts—"discerning of spirits, prophecy, revelations, visions, healing, tongues," &c.—have not ceased. The "discerning of spirits" led Smith, or rather his friends Rigdon, Pratt, &c., who are understood to be the real authors of the metaphysics, into a variety of curious speculations. They believe that the soul of man was not created, but "coexisted equal with God." The *eighth* article is decidedly liberal; it expresses a belief that the word of God is recorded not only in the Bible and the Book of Mormon, but in "all other good books." As for the contradictions that exist in the first, they are admitted, but it is alleged that they are "corruptions," and that they can be removed by any prophet's inspired explanations. On the other hand, the statement that the Saints pretend to have a new and inspired translation of the Bible was denied by Brigham Young in a conversation with Dixon ("New America," vol. i., p. 216-217). The *ninth* article expressed a belief in all that God has revealed, is revealing, or will yet reveal. The *tenth* affirms the literal gathering of Israel, the restoration of the Ten Tribes (the "American Indians," who are, in consequence, treated with considerable humanity by the Saints; the Negro, on the other hand, being excluded from the Mormon Church, as a descendant of Cain), the establishment of the New Zion on the western continent—the millennial reign of Christ on earth, and the transformation of earth into a Paradise. The *eleventh* article maintains "the literal resurrection of the body." The *twelfth* article asserts the absolute liberty of private judgment in matters of religion; the *thirteenth* declares it the duty of the Saints and all others to be "subject to the powers that be," whether monarchical or republican. The *fourteenth* and last is worthy of being universally accepted: "We believe in being honest, true, chaste, temperate, benevolent, virtuous, and upright; and in doing good to all men;" also that "an idle or lazy person cannot be a Christian, neither have salvation."

The great social peculiarity of the sect is their practice of polygamy. It was not so, however, at first. Rigdon, Kimball, Pratt, Hyde, and Young are its true originators; Emma, wife and widow of the prophet, stoutly denied that her husband ever had any wife but herself. Young's "revelation" she declared to be a fraud, and in consequence she withdrew to Nauvoo. Her four sons followed her, and have now founded a monogamic Mormon community, called the *Josephites*. Another branch of the M. (who altogether may number 200,000 souls) has recently settled, at Independence, Missouri, the proposed site of the "New Jerusalem." Meanwhile, at Salt Lake City, the practice of polygamy is encouraged on the ground that the rank and dignity of the Saints is proportioned to the number of their wives and children. A defence of the practice is also set up on moral grounds. M. assert that their community is free of the horrible sin and viciousness that prevail elsewhere; fornication and adultery, with their guilty passions and abandoned conduct, are declared to be unknown; their wives are asserted (Burton and others are very strong on this point) to be happy, virtuous, and healthy, and they challenge comparison in regard to their domestic and social purity and felicity with any monogamic community in the

world. Dixon ("New America," vol. i. p. 243) even sings a sort of prean on their virtues: "Their streets are clean, their houses bright, their gardens fruitful. Peace reigns in their cities. Harlots and drunkards are unknown among them. They keep open more common schools than any other sect in the United States."

See "Book of Mormon" (1830); "Book of Doctrine and Covenants," consisting of select "revelations" given to Smith (1832); "The Pearl of Great Price," also by Smith (first published, Liverp. 1851); "Journal of Discourses," by Brigham Young and others (1854 *et seq.*); "The Exploration and Survey of the Great Salt Lake," by Captain Stansbury (1849); "The Mormons, or Latter-day Saints," by Lieutenant Gunnison of the United States Topographical Engineers (1852); "The Mormons," by Col. T. L. Kane (1860); "The Mormons, or Latter-day Saints, with Memoirs of the Life of Joseph Smith" (Office of the National Illustrated Library, London); "Voyage au Pays des Mormons," par Jules Remy (1860); "The City of the Saints," by R. F. Burton (1861); Dixon's "New America" (1867); and Busch, "Geschichte der Mormonen" (Leips. 1870).

**MORMYRIDÆ**, a family of malacopterous fishes, allied to the *Esocidæ*, or Pike family; having longish compressed bodies, and a slender tail, swelling out at the origin of the caudal fin. The skin of the head is naked, enveloping the gill-covers and gill-rays, leaving only a slit for gill-opening. The mouth is small. All the known species inhabit the rivers of Africa. The **SHARP-NOSED MORMYRUS** (*Mormyrus oxyrinchus*) is regarded as one of the best fishes of the Nile. It is caught by lines baited with worms. The *M.* are nocturnal fishes. They are sometimes represented on Egyptian monuments, and seem to have been held sacred by the ancient Egyptians. The modern Egyptian name is *Mizdeh*. Some of the species have electric organs.

**MORNY**, Charles Auguste Louis Joseph, Comte de, a French statesman, of the second Empire, regarding whose parentage the biographical dictionaries published under imperial censorship are strangely silent. It is, however, universally believed that he was the son of Queen Hortense and of the Comte de Flahaut, and consequently half-brother of Louis Napoleon. He was born in Paris, October 20, 1811. The Comte de Morny, a French nobleman resident in Mauritius, received 800,000 francs to adopt him as his son; but he was educated by his "grandmother," Madame de Flahaut; and Queen Hortense left him at her death, in 1837, an annuity of 40,000 francs. *M.* entered the army in 1832 as a sub-lieutenant, and is said to have shewn at this early period a predilection for metaphysics and theology, which is indeed sufficiently surprising, if true, considering his subsequent thirst for material gratifications. He served with some distinction in Algeria; but he soon abandoned a military life, and in 1838, made his début in the world of industry as a manufacturer of beet-root sugar, and published a pamphlet on the subject. Ever after that time, he was mixed up in all sorts of commercial and financial speculations—railway companies, canal companies, French and foreign mining companies, credit societies, industrial enterprises, &c. Chosen a deputy in 1842, he quickly attained a prominent position on account of his aptitude for dealing with financial questions; but events shewed that he was not free from the reckless spirit of an adventurer, and his daring at times excited a suspicion of enormous swindling somewhere. After the revolution of 1848, he became attached to the cause of his half-brother, and was the leader of the subtle and treasonable policy of the Elysée. He took a prominent part in the *coup d'état*. His rôle was to exhibit *coup-froid*, and to throw the republican leaders off their guard. Nor did he fail of success. He passed the evening of December 1 at the *Opéra Comique*, and yet, by six o'clock the next morning the deed was done, and *M.* was Minister of the Interior. In 1854, he became president of the *Corps Législatif*, and was ambassador to Russia during 1856–1857, where he married the rich and handsome Princess Trubetskoi. The result of his Russian mission was the establishment of intimate political relations between the two governments, and a commercial treaty advantageous to both countries. He died May 1865.

**MOROCCO**, or Morocco, called by the natives *Maghrib-el-Aksa*, "the extreme west," or briefly *Maghrib*, an empire or sultanate in the north-west of Africa, is bounded on the e. by Algeria, on the n. and w. by the Mediterranean Sea and Atlantic Ocean, and on the south by a line which runs from Cape Nun (lat. 28° 45' 48" n.), in an easterly direction through the Sahara to the Algerian frontier in long. 9° e. At

the present day, M. includes the three former kingdoms of Maghrib, Fez, and Tafilélet, and contains about 260,000 English square miles, with a population of which the estimates vary from 2,500,000 to 3,000,000. The country is generally mountainous, the Atlas (q. v.) range traversing it in several parallel chains from south-west to north-east, and sending out numerous spurs to both the coast-country and the desert. There are, however, many level tracts throughout M., especially at its western and eastern extremities, and on the borders of the desert. The central range of the Atlas forms the water-shed separating the streams which flow into the Atlantic and Mediterranean from those which run southward to the desert. The former rivers have the shorter course and less volume, but they are perennial; while the latter become dry in summer, and even when running are lost in the sands of the Sahara. The chief rivers are the Muluya, with its tributary the Sharef, which drains the north-east of the country, and falls into the Mediterranean after a course of 400 miles; the Kos, Oom-a-beg, Bu-Regreb, Tensift, Suse, and As-aker, the last forming for part of its course the southern boundary of M., drain the central and western districts, and fall into the Atlantic; the Draha, Feli, Ziz, and Gir, irrigate the dry plains of Tafilélet, and the first-mentioned then empties itself into the Atlantic Ocean. The subsequent courses of the other three rivers are not yet well ascertained.

The climate between the central range of Atlas and the sea is temperate, the thermometer seldom falling lower than 40° F., or rising above 90° F., owing partly to the regulating influence of the sea-breeze, and the shelter afforded by the mountains from the scorching winds of the desert; but in the south-east districts, extremes of heat and cold are said to prevail, and rain is there unknown.

Among the chief products of the country are wheat, barley, rice, maize, durra, and sugar-cane; and among fruits, the fig, pomegranate, lemon, orange, and date are common; while cotton, tobacco, hemp, &c., are largely produced both for home use and export. M. is supposed to be rich in mineral treasures; plentiful supplies of copper are obtained at Teseleht, near the source of the Asaker, and gold and silver occur in several places. Iron, antimony, lead, tin, and rock-salt, the last three in considerable quantity, are also found. Owing to the character of the country and its thin population (33 to the English square mile), M. is much infested with wild animals. Lions, panthers, hyenas, wild-boars, and various kinds of deer, gazelles, &c., abound in suitable localities, and occasional devastating are committed by locusts. Ostriches are found in Tafilélet. The Moorish horses, formerly so famous, are now much degenerated. The breeding of sheep, oxen, goats, camels, mules, and asses, forms an important item of national industry. Oxen and bulls are chiefly employed in field-harbor.

The inhabitants, like those of Barbary in general, consist of Moors, Berbers, Arabs, Negroes, and Jews, with various intermixtures between these races. More than two-thirds of the population belong to the race commonly called Moors, the remaining third consisting mainly of Berbers or Amaziyehs (including the Berbers of the Rif Coast, and the Shilluhs of the Great Atlas); Jews, estimated at 240,000; and negroes. Very few Europeans reside in Morocco. The state of civilisation is very low, and many of the Amaziyehs are complete savages. Excepting the Jews and the few Europeans, the whole population is Mohammedan. Negroes are brought into the country as slaves from Sudan.

M. is divided into four territories—Fez, Morocco, Suse, and Tafilélet. For convenience of administration, the empire is subdivided into 33 governments or districts ("amnahs"), each under the superintendence of a "caid," whose chief duty it is to collect the imposts; but the semi-independent tribes are ruled by their own chiefs, and scarcely acknowledge the authority of the sultan. The government is purely despotic, and in the absence of written laws, the will of the sultan and his subordinates decides everything. The public officials eke out their allowances by practising extortion on those under their charge, and are in turn plundered by their superiors. The sovereign of M., called by Europeans the Emperor of M., is known among his subjects as sultan, and assumes the titles of *Emir-ul-muminin*, or "Prince of the Believers," and *Khalifah-Allah-shalkih*, or "Vicerent of God upon Earth." The title is hereditary in the male line, but does not necessarily descend to the eldest son.

Education consists in learning to read, write, and recite portions of the Koran,

and this quantum of education is pretty generally diffused among the people, but the art of printing is unknown, and the arts and sciences are at a very low ebb.

The only industrial arts prosecuted to any considerable extent are the manufactures of caps, fine silks, and leather. In the production of this last, the Moors far surpass Europeans, and are able to render any kind of leather extremely soft and white, by the use, it is said, of two species of plants found in the country, and unknown to Europeans. They also excel in the production of brilliant colors in leather. The yellow leather is made in M. Proper, the green in Tafflelet, and the red in Fez. There is an important caravan-trade between M. and Sudan, and also with Mecca and the Levant. The principal exports are wool, hides, grain, cattle and sheep, leather, salt, &c.; and the imports, cotton, linen, and muslin goods, sugar, tea, coffee, hardware, gold-dust, indigo, ivory, &c. Mules, horses, and camels, form the internal means of transport. Much of the Arabian trade is carried on by coasting-vessels between Tangier and Egypt, as the carriage across the desert is very costly. At the present time, two-thirds of the entire trade of M. is in the hands of British merchants.

The army consists of between 20,000 and 30,000 men, of whom one-half are negroes; there is also a sort of militia, amounting to 80,000 or 100,000 men, which is occasionally called out. The navy is now insignificant; but in former times, especially in the 16th and 17th centuries, it was very formidable to the maritime powers of Europe, and was chiefly occupied in piratical expeditions. See *RIF*.

The history of M. is, generally speaking, similar to that of the rest of Barbary (q. v.) down to the end of the 15th century. About that time, it was formed into a monarchy, and notwithstanding internal divisions, enjoyed considerable prosperity, and the confines of the empire were extended as far south as Timbuktu. This empire fell to pieces, and was succeeded in 1647 by that of the Sherifs of Tafflelet, who conquered both M. Proper and Fez, and united the whole country under one government. This is the present ruling dynasty. In the middle of the 17th c., the empire of M. embraced part of the present province of Algeria, and extended south as far as Guinea, where it came into collision with the Portuguese settlements. Since the commencement of the 19th c., the rebellions of the wild mountain tribes, the disturbances in Algeria, and difficulties with foreign states, caused by the aggressions of the Riff pirates, have greatly retarded the well-conceived measures of the various rulers for the development of the resources, and increase in civilisation of Morocco. In 1814, the slavery of Christians was abolished; and in 1817, piracy was prohibited throughout Morocco. In 1844, M. took part in the war of Abd-el-Kader against the French, in the course of which Tangier was bombarded and Mogadore occupied; but peace was concluded in the same year. In 1851 and 1856, complications took place with France concerning some French vessels which had been plundered by the Riff pirates, but in each case compensation was given by the sultan. In 1859, the Spanish government, smarting under a series of similar outrages, demanded compensation, and also an apology for an insult to the Spanish flag at Ceuta; and on the sultan's disclaiming all responsibility for these acts, war was declared by Spain, October 23, 1860, and a large force under Marshal O'Donnell invaded Morocco. Two battles were fought, several ports were bombarded, and Tetuan taken, and on March 25, 1860, the sultan yielded. A treaty was accordingly signed, April 27, 1860, by which the sultan ceded some portions of his territory, paid 20,000,000 piastres towards the expense of the war, and granted several commercial privileges to Spanish merchants.

**MOROCCO** (Arab. *Marakash*), the capital of the empire of the same name, is situated in the south-west of the country, 4 miles south of the river Tensift, and at the north end of an extensive and fertile plain. It is surrounded by a strong lime-and-earth wall 30 feet high. The town is ill built, the streets narrow, irregular, and unpaved; the houses, generally built of the same materials as the wall, are one story high, with flat roofs, and narrow openings instead of windows. A large portion of the space within the walls is occupied with gardens, open areas and market-places. In the bazaar and market-place, a large miscellaneous trade is carried on. M. possesses 20 mosques, of which 6 are remarkable for their size and elegance. There are several tanning and leather-dyeing establishments, some of them of great extent. The population is estimated at about 60,000.

Moron  
Mo. se

264

On the south of the city, outside the walls, stands a palace of the sultan of M., occupying a space of about 190 acres.

M. was founded in 1073, and reached the summit of its prosperity in the 18th c., when it contained more than 700,000 inhabitants, since which time it has been rapidly decaying. It is now half in ruins.

MORO'N, a town of Spain, in the province of Seville, and 87 miles south-east of the city of that name, on the Guadaira. It is built on irregular acclivities, and contains the remains of a once almost impregnable castle, erected by the Moors on Roman foundations. The inhabitants are engaged in the culture and preparation of olive-oil. Pop. 9000.

MO'RPETH, a market-town and parliamentary and municipal borough of England, in Northumberland, is situated on the Wansbeck, 15 miles north of Newcastle. Of the principal buildings, the parish church dates from the 14th c.; the Free Grammar-school of Edward VI., founded in 1552, has an income from endowment of £650 a year; the town-hall was erected by Sir John Vaubrough. Flannel is manufactured; brewing, malting, and tanning are carried on, and iron foundries, and corn-mills are in operation. M. returns 2 members to the House of Commons. The pop. of the parliamentary borough in 1871 was 30,289.

MO'RPHEUS (literally, the "shaper" or "fashioner"), in the Classic Mythology, the son of Somnus (Sleep), and the god of dreams. He is so named, because he shapes or moulds the dreams that visit the sleeper. He is first mentioned by Ovid, and is represented as an old man with wings, pouring somniferous vapor out of a horn.

MO'RPHIA ( $C_{17}H_{15}NO_6 + 2 Aq$ ) derives its name from Morpheus, in allusion to its narcotic properties. It is the most important of the alkaloids existing in opium, of which it constitutes from  $\frac{1}{10}$ th to  $\frac{1}{16}$ th by weight. It occurs in combination with meconic, and sometimes with sulphuric acid. It is obtained in short rectangular prisms, containing two equivalents of water of crystallization, which are expelled at a gentle heat, when the morphia melts into a resinoid substance. Morphia is soluble in about 1000 parts of cold and in 400 of boiling water; boiling alcohol dissolves it freely, but it is insoluble in ether and chloroform. Its solutions have a bitter taste, and change the yellow color of turmeric paper to brown. Morphia is not so easily detected in cases of poisoning by opium as Meconic Acid (q. v.). The following are the ordinary tests for it: concentrated nitric acid, when applied to a crystal either of morphia or of one of its salts, produces an orange color. A mixture of nitric and sulphuric acids colors it green. When it is mixed with iodic acid, iodine is liberated, which may be recognised by its brown color and by the well-known starch-test. A neutral solution of perchloride of iron produces a beautiful blue color.

Morphia is the only opium-alkaloid which is soluble in lime-water, and this property affords one of the best means of extracting it. A watery infusion of opium is boiled with milk of lime, filtered, mixed with powdered sal-ammoniac, and again boiled. By this means, the lime is converted into the hydrochlorate (or, more correctly, into chloride of calcium), the ammonia is volatilised by the heat, while the morphia is precipitated in a crude form, which admits of easy purification.

Morphia combines with acids to form crystallisable salts, which are readily soluble in water and in alcohol. Of these, the *Hydrochlorate* (*Muriate*) and the *Acetate*, especially the former, are much used in medicine.

The therapeutic uses of morphia and its salts are very similar to those of Opium (q. v.); but the preparations of morphia are preferable to opium and laudanum in being less liable to occasion nausea and headache. The ordinary dose of morphia, or its hydrochlorate or acetate, when given to an adult to allay pain or induce sleep, ranges from a quarter of a grain to half a grain. The British Pharmacopœia which was first published in January 1864, and which superseded the London, Edinburgh, and Dublin Pharmacopœias, contains a solution of the hydrochlorate of morphia in which there is half a grain of the salt in one drachm of the solution; hence the ordinary doses of this solution range from 30 minims to a drachm. The pharmacopœia also contains morphia lozenges and morphia and opœacian lozenges, in each of which there is one-thirty-sixth of a grain of hydrochlorate of morphia.

**MORPHOLOGY.** See **METAMORPHOSIS OF ORGANS.**

**MO'RRIS-DANCE**, a peculiar and fantastic species of dance, commonly practised in the middle ages, and existing at the present day among the country people in several parts of England. Its origin is ascribed to the Moors, though the genuine Moorish dance (the *sandango* of the present day) bears little resemblance to it. The chief performer was the *hobby-horse*, so called from the light frame of wicker-work which was fastened round his body, and supplied with a pasteboard head and neck, so as to give him the appearance of a man on horseback. Bells were also attached to his ankles, and the great art consisted in so moving the feet as to produce a rude kind of concord. The other principal actors, after a rude fashion, personified the characters of Maid Marian, the Queen of the May, Robin Hood, Friar Tuck, the Fool, &c.; and the performance was accompanied by rude music, and the clashing of swords and staves, and was the chief amusement at parochial festivals.

**MORRISAN'IA**, a village of New York, United States, in Westchester County, on the New York and New Haven Railway, and about ten miles north of New York. It has been mostly built within the last twenty years, and is chiefly occupied by persons doing business in New York, to which it has been amalgamated.

**MORRISON**, Robert, D.D., the founder of Protestant missions in China, was born of Scottish parentage at Merpeth, in Northumberland, 5th January, 1782. He studied at one of the Independent colleges, and in 1805, he was sent to Macao and Canton by the London Missionary Society, to learn the Chinese language, and to translate the Bible into it. He reached Canton in September 1807, and in the course of a year was appointed translator to the East India Company's factory at Canton. By the year 1814 he had completed the translation and printing of the whole of the New Testament. Four years later, by the help of Mr (afterwards Dr) Milne, he had done the same with the Old Testament; and in 1822, he completed and printed his great "Chinese Dictionary" at an expense to the East India Company of £15,000. In 1816, he acted as interpreter to Lord Amherst. In 1818, he established an Anglo-Chinese College at Malacca for English and Chinese Literature, and for the propagation of Christianity. After a residence of 17 years in China, he returned to England in 1824, and brought with him a collection of 10,000 books in the Chinese tongue. In 1826, he returned to China. In 1834 he accompanied Lord Napier to Canton as interpreter, and died there 1st August. Besides the works already mentioned, he is the author of "Horse Sinice" (Lond. 1812), being translations from the popular literature of the Chinese; a "Chinese Grammar" (Serampore, 1815), and "Chinese Miscellany" (1825). In 1839, his widow published "Memoirs of the Life and Labors of Robert Morrison."

**MO'RRISTOWN**, a village of New Jersey, United States of America, on the Whippany River, and the Morris and Essex Railway, 23 miles west of New York, on an elevated plain, commanding a fine prospect. It has a court-house, 2 banks, 8 churches, and several literary institutions. Pop. (1870) 5674; (1890) 5418.

**MORSE**, Walrus, or Sea-horse (*Trichechus*), a genus of amphibious mammalia of the family *Phocidae*, agreeing with the rest of that family—the seals—in the general form of the body and limbs, but widely differing from them all in the head, which is remarkable for the enormous development of the canine teeth of the upper jaw, and the tumid appearance of the muzzle caused by the magnitude of their sockets, and by the thickness of the upper lip. These great canine teeth form two tusks directed downwards, and the lower jaw becomes narrow in front, so as to pass between them. There are no canine teeth in the lower jaw. The incisive teeth are small, six in the upper jaw, and four in the lower, mostly disappearing from adult animals. The molars—at first, five on each side in each jaw, but fewer in the adult—are simple, and not large; they have the crowns obliquely worn. The nostrils, as if displaced by the sockets of the tusks, open almost upwards, at some distance from the muzzle. The eyes are small; and the ears have no auricle, or, in popular language, there is no ear.—There is only one known species (*T. rosomarus*), sometimes called the **ARCTIC WALRUS**, an inhabitant of the Arctic seas and of the colder parts of the north temperate zone. It sometimes attains a size greater than that of the largest ox, and the tusks are sometimes two feet,

Mortality

or even thirty inches long; but the ordinary length of the tusks is only about one foot. The M. is a gregarious animal, and is often seen in great herds, which sometimes leave the water to rest for a while either on the ice or on the land, where, however, their movements are very awkward and clumsy, and the hunter assails them with much greater prospect of success than in the water. Hundreds have thus been killed at one time, although the adventure is not without danger, as they must be assailed with spears, their hide being thick enough to resist even a rifle bullet. The M. uses its tusks for protecting itself or young from attack, for combating with its enemy the polar-bear, for aiding it in climbing upon ice; but principally, it is supposed, for tearing seaweed from submarine rocks; that being, there is every reason to think, the principal food of the animal, although it is supposed also to prey on molluscs, crustaceans, and other marine animals. The female M. shews great affection for her young, and will defend it to the last extremity; the young also remains beside the mother even after she is killed. When one of these animals is attacked, the rest of the herd—at least if in the water—hasten to its assistance. The M. is very capable of being tamed.—It is much sought after by the inhabitants of the most northern parts of the world for its skin, thongs of which seem to have been generally used in former times for ropes and cables—esteemed so valuable, that the Finlanders paid tribute in this article; whilst its oil—not very abundant—is employed like seal oil; and the tusks are very much valued as ivory, being superior in compactness to those of the elephant. The flesh is coarse, but is eaten by the Esquimaux. The young M. has not large tusks like the adult.

The M. has occasionally been seen on the British coasts, probably transported on icebergs from the north.

The name M. is from the Russian *Morsk* or Lapp *Morsk*. The name *Walrus* is Norwegian (*Heal-ros*, Whale-horse). Another Norwegian name is *Rosmar*, supposed to be from the Teutonic *ros*, horse, and *mar*, the sea.

MORSE, Samuel Finley Breese, LL.D., &c., American artist and inventor, was the eldest son of Rev Jedediah Morse, D.D., geographer, and was born at Charlestown, Massachusetts, April 27, 1791. He graduated at Yale College in 1810, and visited England with the American painter Washington Allston, to study painting with him and Benjamin West. In 1813, he received the gold medal of the Adelphi Society of Arts for his first effort in sculpture, the "Dying Hercules." Returning to New York in 1815, he became the first president of the National Academy of Design, and was appointed Professor of the Arts of Design in the university of the city of New York. He did not give his entire attention to art, but was interested in chemistry, and especially in electrical and galvanic experiments; and on a voyage from Havre to New York, in 1832, he conceived the idea of a magnetic telegraph, which he exhibited to congress in 1837, and vainly attempted to patent in England. His claims to priority of invention over Professor Wheatstone in England have been the subject of considerable controversy. See TELEGRAPH. He struggled on with scanty means until 1843, when, as he had almost yielded to despair, congress, at midnight, and the last moments of the session, appropriated 80,000 dollars for an experimental line between Washington and Baltimore. For his telegraphic inventions, M. was rewarded by testimonials, honors, orders of nobility, and wealth. Several European states joined in presenting him a purse of 400,000 francs, and banquets were given him in London and Paris. The recording instrument in use in America is his invention.

MORSHANSK, a district town in the centre of the government of Tambou in European Russia, 56 miles north of Tambov, is situated on the left bank of the Tena, a feeder of the Oka. Its population in 1867 was 19,819. M. is the port for shipment of the corn of the provinces of Simbirsk and Saratof, the shipments annually amounting in value to 5,000,000 rubles. There is also a large market for the cattle and sheep of the south-east provinces, the average annual supply being 90,000 cattle and 100,000 sheep; also for melted grease, of which 1,500,000 rubles worth is sent yearly to St Petersburg and Moscow. The trade of the town itself is of little importance, the chief establishments being soap-boileries, flour-mills, and sailcloth manufactories.

MORTALITY, Law of. While there are few future events the date of whose arrival is more uncertain than that of death to any one man, on the other hand, the

average duration of a multitude of human lives is found to be in accordance with a law which operates as surely as that of gravitation. If it be asked how many lives must we have, before we can depend on obtaining from them a duration equal to the general average, the only answer that can be given is, that the more we have the more nearly must we approach to this result; the fluctuation ultimately becoming so small as to be practically of no effect. So long ago as early in the 17th c., a certain John Graunt of London published what he called "Natural and Political Observations on the Bills of Mortality." This work has been called "the earliest movement in economical arithmetic, and the closest approximation to the data on which life-assurance is founded." About the same time, Sir William Petty gave to the world many curious calculations and speculations on the same subject. In 1698, Dr Halley published the Breslau tables of mortality, and this was the first work which really raised the subject to the rank of a science. Halley's speculations had, however, been preceded by those of Pascal in France, and of De Wit in Holland; and the latter famous man is probably entitled to be considered as the first who has applied the doctrine of probabilities to the valuation of life in the question of annuities. His treatise will be found in the second volume of the "Assurance Magazine." Halley's tables are printed in the "Philosophical Transactions" for 1693, No. 196. In 1713, J. Bernoulli's important work was published; and in 1742, Dr Price, availing himself of the principles laid down by Halley, and of data previously published by "John Smart of Guildhall, London, Gent.," gave tables of mortality for London. In 1744, M. Deparcieux published at Paris his "Essai sur les Probabilités de la Vie Humaine," in which he gave six valuable tables. In one of these, computed from the registers of different religious houses, it was shewn, for the first time, that female life is superior to male. In 1770, appeared the first edition of Price's "Observations on Reversionary Payments." The speculations of Buffon, Simpson, and De Moivre about the same time were of much importance. Mortality tables are tables shewing the operation of the law of mortality. The correct method of framing them is by analysing and collating accurate and sufficiently extensive statistics of life and death. They enable us to form a fair estimate of the number of human beings who will die at the end of a given period out of a given number alive at the beginning of it; and hence, the chance of life and death to the individual, and the mean duration of life at any age. Tables shewing the mean duration of life have been constructed in two ways: 1st. From statistics of deaths alone; and 2d, From statistics of life and death. By the first plan, they would be deduced as follows: Suppose, on searching a parish register, that we found recorded 100 deaths of children in their first year, we should assume that, on an average,  $\frac{1}{2}$  a year of life would have fallen to each. This gives 60 years of life among 100. If we found that 60 had died in their second year, assigning one year and a half to each, we should have  $60 + 1\frac{1}{2} = 90$  years among the 60; and so on for every age up to the oldest on the register. The sum of all the years enjoyed, divided by the numbers who have enjoyed them, will give the mean duration of life from birth; and the sum of all the years enjoyed after a given age, divided by the numbers who have enjoyed them, will give the mean duration at the given age; in both cases as nearly as the data enable us to give it; but the data are insufficient. Suppose we found by a register for 1873 that 100 children had died in their first year and one man in his 96th, it is plain that, to make this ratio a fair one, there ought to have been as many births in 1778 as in 1873. If there have been only half as many born at the former date as at the latter, then we must put two lives into the calculation to make it correct; and we must proportion our results similarly at all intermediate ages. Again, suppose four deaths at age 23 to be registered, we cannot tell how many of those born in 1850 may have emigrated from one parish, nor do we know how many born elsewhere in that year may have come into it. For the rule and formula for obtaining the mean duration of life under the second method, which is an absolutely certain one, see LIFE, MEAN DURATION OF. The following are the tables now most generally used by assurance and annuity offices in this country: I. The Northampton (Dr Price's). This table was framed by Dr Price from the register of burials in the parish of All Saints, Northampton, 1735-1780. Being constructed on deaths alone, it has, as was to have been expected, proved faulty. It gives the probabilities of life too low at the younger and middle ages; and those offices which still use it—and there are a good many—have some difficulty in keeping themselves right. II. The New Northampton (Nos. 1

and 2). These tables were constructed by Dr Farr. See Eighth Report of the Registrar-general for England, pp. 277—343. No. 2 is based on the deaths alone in Northampton during the seven years 1833—1844. In its results it agrees almost exactly with that of Dr Price. No. 1 was deduced from a comparison of the deaths during 1833—1844 with the census returns of 1841. It differs widely from No. 2 and from Dr Price. By the two latter, the mean duration of life is respectively found as 24.68 years and 25.13 years. By No. 1, it is 37.5 years. III. The Carlisle. This table was constructed from observations made by Dr Heysham at Carlisle, 1780—1787. It is now generally understood that the mortality in towns is understated at ages 15—35, owing to the immigration of healthy men and women from the country. Again, the female population of Carlisle was excessive during the period in question, and the extent of the observations was limited. Owing to these facts, this table gives rather too low a rate of mortality, and is a little irregular in its graduation. In a table prepared by W. T. Thomson, Esq., in a Report on the Ministers' Widows' Fund of the Church of Scotland, 1861, he shews that the lives of the Scotch clergy are about half a year better up to 44 than the Carlisle; at 45, they are equal; and at 45 to 80, they are half a year worse. Thereafter they vary. The widows are half a year better up to 61, equal at 62, and nearly so to the end. Probably the Carlisle gives a fair mortality rate for a healthily circumstanced population. IV. The Government. These were computed by Mr Finlaison on the lives of 22,000 nominees for government annuities. They are chiefly important as giving a view of the value of female life, but this view is one which differs widely from those given either by the "Experience" or by the "English" table. At age 20, for instance, the mean duration of female life is, by the Government table, 5½ years more than the male; by the Experience, it is 4 years less. In some measure this wide divergence may perhaps be accounted for by the fact that the Government results are deduced from annuitants, the Experience from assured lives. The experience of late years has, however, led to some modification in the relative values of male and female life in government tables. V. The English (Nos. 1, 2, and 3). No. 1 is deduced from the living by the census of 1841, and from the deaths at corresponding ages in the same year. See 5th and 6th Reports of the Registrar-general for England, where the tables will be found, and their construction explained. No. 2 is deduced from the living in 1841, and from the deaths in the seven years 1833—1844. No. 3 is deduced from the population in 1841 and in 1861, and on the deaths for the 17 years 1833—1854; male and female life being calculated separately and in combination. These "English" tables probably give the results of the average mortality of England more correctly than any others which we have. They are the result of enormous labor on the part of Dr Farr. The observations were taken on the plan recommended by Professor de Morgan and Mr Griffith Davies. VI. The Experience. These were prepared by a committee of eminent actuaries on the data afforded by the combined experience of 17 life-assurance offices. The objections to which they are liable are, that certain lives having been more than once assured have appeared twice or oftener as elements in the calculations; that the average term over which the observation of the offices extends is only eight and a half years; and it is probable that the mortality which will prevail in assurance societies when they have reached maturity is somewhat understated. See letter by Dr Farr in Appendix to 10th Report of Registrar-general, p. 11. Further, the data for old ages were deficient, and this of course affects the whole. Many curious results are brought out by this table. It shews that "town" assured life is superior to "country;" that female assured life is on the whole inferior to male; and that Irish life is worst of all. At age 20 "town" mean duration is 41 years, 3 months; country, 40 years, 4 months; Irish, 34 years, 11 months. The observations of the Standard Assurance Company do not, however, bear out these results; and they are doubtless so largely affected by the elements of *Care in Selection* as to render it impossible to found on them any conclusion of practical value. A new set of "Experience" tables was published in 1873, based on the mortality experiences of twenty offices, ten English and ten Scotch. They do not shew any widely different results from the former Experience tables. These form a very valuable set of tables. They give the results of English and Scotch experience united, and of Scotch separately.

In all tables deduced from the experience of assurance and annuity societies, the

fact of *selection* must not be lost sight of, either in using them for the sake of comparison, or as the basis of other tables. Actuaries, however, seem to be generally of opinion that the selection exercised by assurance societies does not really lower their rates of mortality below the general average; without selection, their rate would be above the general mean; for, it will be observed, that the public are continually selecting against the offices by offering inferior lives, and good lives often surrender their policies, while lives which have become bad hardly ever do so. Again, the value of medical examination gradually disappears, and in ten years at most it is quite lost. Five to seven years is indeed now held by the assurance offices to exhaust its value. See Minutes of the House of Commons' Committee on Assurance Associations, 1853; and Life-contingency Tables by R. J. Farren, pp. iil.—xiii. Though female life is, as a whole, undoubtedly superior to male, yet as there are more critical periods in it, it is probable that the public may more frequently select it than male life against the societies. A valuable report on the Madras Military Fund (London, 1863) gives tables constructed on the mortality rates prevailing among the officers, wives, and widows interested in the fund. As they have been, prepared by eminent men on very ample data, they will probably be very valuable to societies transacting business in India. We give a view of the mean duration of life, at the beginning and at each decennial period, according to the table mentioned above.

In the present article, we have considered the law of mortality, chiefly as it bears on insurance and other monetary transactions. The wider view of the subject, as varying with occupation and in different ages and countries, will be illustrated under the head of **VITAL STATISTICS**.

**MORTAR.** See **CEMENTS**.

**MORTAR**, a piece of artillery which differs from a cannon in the large diameter of its bore in proportion to its length, and in the circumstance that it is usually fired at a considerable angle, so that the projectile may strike the object aimed at in a direction more or less vertical. The object for which mortars are intended is the discharge of **LIVE SHELLS** (q. v.) or carcasses. As the projectile has a large diameter, and, except in rare instances, a very great range is unnecessary, a comparatively small charge of powder is requisite. To give this its utmost power and concentration, it is confined in a hemispherical chamber at the lower end of the bore, but of less diameter. The shell completely closes this chamber; and when the explosion ensues, receives its full force on its centre. In the British service, the ordinary mortars range in diameter of bore from 5 to 18 inches.

Larger mortars have, however, been tried at times, as at the siege of Antwerp Citadel in 1832, when the French brought one of 24-inches bore to the attack. This monster, owing to its unwieldiness and other causes, was a failure. Larger still than this, though perhaps more manageable, is Mr Mallet's great 36-inch mortar, constructed in 1853, of iron parts welded together, and now at Woolwich, rather as a curiosity than for use. As loaded shells are of immense weight, so heavy, indeed, as in larger calibres to involve the necessity of a strong apparatus to deposit them in their places, and the mortar is fired at high elevations, the recoil is so great and so nearly vertical that no carriage could withstand the shock; it is necessary, therefore, that the mortar should be mounted on a solid iron or timber bed, by the trunnions, which are placed behind the breech, and supported in front by massive blocks of wood. The arrangement renders the apparatus so heavy that mortars of large size are rarely used in field operations, their ordinary positions being in defensive or siege works, and in mortar-vessels.

More widely, however, are the Coehorn mortars, invented by the Dutch engineer of that name, for clearing the covert-way or ditch of a fortress. This mortar is sufficiently small to be managed by one man, and is accounted useful in siege or defence operations. The French use a similar Lilliputian ordnance under the denomination of *pierriers* or stone-throwers. Small mortars are likewise constructed for mountain warfare; a mule carries the mortar, another the bed, and a third is laden with the projectiles. The use of mortars is diminishing at the present time, elongated shells of great weight being now thrown from rifled cannon.

**MORTARA**, Edgar, a Jewish boy, whose case recently attracted great and painful interest throughout Europe. The facts are as follows: On the 23d of June 1858,

Signor Momolo Mortara, a manufacturer and wholesale merchant of cloth in Bologna, and by religious profession a Jew, returning home about ten o'clock at night, found his house in the possession of the police, who informed him that they had orders from Padre Felletti, inquisitor-in-chief at Bologna, to carry off his son, Edgar, who had been surreptitiously baptized into Christianity by a Roman Catholic maid-servant. The inquisitor was waited upon by some friends of the family a little after midnight, who implored delay. He informed them that he was acting under the orders of the Archbishop of Bologna, but consented to sist procedure till "next evening." The archbishop, however, was "absent" from the city, and next evening the papal carbiniers entered the house and "tore the child out of his father's arms." They carried him to Rome, where he was immured in a convent. The bereaved father immediately followed, obtained several interviews with Cardinal Antonelli, and offered to prove that the servant who said she had baptised Edgar had turned out to be a worthless prostitute, living in sin with Austrian officers. The cardinal declined to interfere, on the ground that the case did not come under his jurisdiction, and recommended Signor Mortara to apply to "the proper tribunals." After some weeks had passed, the child was removed to Alatri, whither his father and mother also went, and saw Edgar in a church among a number of priests, but had no opportunity of speaking to him. They returned to Rome, once more sought the presence of Cardinal Antonelli, and prevailed upon him so far that he ordered the child to be brought back to the city, and allowed his parents several times to converse with him. These interviews are described as agonising, and Edgar earnestly entreated his father and mother to take him home, but this of course was a hopeless request. He had been baptised, and baptism, no matter by whom administered, was an inviolable rite, which laid the Catholic Church under the solemn obligation of protecting its son from the snares of parental infidelity. It dared not give him up. Signor Mortara and his wife had to go away without their child. The case soon became known throughout Europe, and excited great indignation, more particularly in England. The Evangelical Alliance drew up a protest, which was signed by the Archbishop of Canterbury and above twenty other bishops, by a large number of peers, members of parliament, heads of colleges, and ministers of the gospel, by upwards of a hundred mayors and provosts, and by many other influential laymen. It was presented to Lord John Russell. The British Jews presented another. Nothing, however, was effected by these efforts. Edgar Mortara remained, of his own choice, the result would seem to prove, in the hands of the Roman Catholic Church authorities. He was educated for the priesthood, became an Augustine monk of the monastery Notre-Dame de Beauchêne, and preached his first sermon in 1874. The narrative, which created such excitement as echoed this boy's name over all the world, was at the time taken by the judicious as an *ex parte* statement; no authorised exposition of the facts, on the part of the Roman authorities, having ever been made public.

**MORTAR-VESSEL**, a class of gun-boat for mounting sea-service mortars, and in some cases provided with steam-power. The mortars are usually of the largest calibre, 13-inch. To enable the mortar to be properly manœuvred, and to resist the recoil from the nearly perpendicular explosion of so great a piece of ordnance, the vessel has considerable breadth in proportion to her length. The mortar is slung astidships in a massive bed. The ancient form of mortar-vessel was the "bomb-ketch," convenient because of the length of deck without a mast. The present vessel originated during the Russian war, and were found serviceable at the bombardment of Sveaborg.

**MORTGAGE**, in English Law, is the temporary pledging of land in security of a debt; and as the land cannot be delivered into the creditor's hand, he acquires a hold over it by a deed called an indenture, or deed of mortgage. The ordinary form of a mortgage-deed, resembles an absolute conveyance, but it contains a proviso that if the money borrowed is repaid within a certain time, then the mortgagee shall reconvey the land to the mortgager or borrower. There is a mode of executing a mortgage without any deed, which is common with bankers and others who lend money. This consists in the borrower taking the title-deeds of his land to the banker, who keeps the deeds and lends money on the faith of them. This is called an equitable mortgage by deposit of title-deeds, but in point of fact is as good as

any other mortgage. Mortgage deeds do not require in England to be registered, except in Middlesex and Yorkshire; and hence a person not unfrequently mortgages his property two or three times over, though the security is insufficient for all the debts. But in general this can only happen by the carelessness of one or other of the mortgagees, for the first mortgagee ought to have the title-deeds in his possession, and ought not to part with them, as they are his chief protection. A mortgagee can assign his mortgage security to another person, who thereupon stands in his shoes. If the money is not paid at the time originally appointed in the deed, then interest becomes due, and the deed is held as a security for both principal and interest. The remedy which the mortgagee has if the money is not paid at all, or not paid after due notice, is threefold. The mortgagee may exercise the power which the deed always contains to sell the estate and pay himself out of the proceeds. Or the mortgagee may enter into possession, and draw the rents and pay himself by instalments. Or he may foreclose the mortgage—i. e., he commences a suit in the Court of Chancery, the effect of which is to allow a short time to the mortgagor to pay the debt, failing which the court will order it to be sold to satisfy the debt. Another remedy is for the mortgagee to sue the mortgagor for the money in an ordinary action. All these remedies may be pursued at one and the same time. Sometimes when a second and third mortgage are given over the same estate, which is often done when the estate is large, compared with the money borrowed, it happens that the third mortgagee gets a prior title to the second mortgagee by buying up the first mortgage. On doing this, he can tack the third mortgage on to the first by the doctrine known as the tacking of mortgages. As a general rule, if nothing is said, the mortgagor or borrower pays all the costs of the mortgage transaction. Until the estate is sold, or the security foreclosed, the mortgagor has what is called the equity of redemption, i. e. he can at any time, on payment of the debt, compel the mortgagee to reconvey the property to him. Mortgages in England are not a first-class security, and hence trustees who are not specially authorised by their deed or will to invest in mortgage security do it at their risk, it being assumed that the only investment which is absolutely safe is government stock. In Scotland, mortgages are generally called bonds and dispositions in security, and form a higher and better security than in England, owing to there being a regular system of registration of deeds affecting land; and hence trustees are entitled to invest their funds there in mortgage security, which is considered as safe as government stock, and less liable to fluctuations of interest. In Scotland, there is no such practice as mortgaging lands with banks by merely depositing the title-deeds. See **BOND, DISPOSITION IN SECURITY.**

**MORTIFICATION**, in Scotch Law, is a term used to denote lands given for charitable or public uses. When lauds are so given, they are in general formally conveyed to the trustees of the charity, to be held *bleuch*, or in *feu*. When mortifications are given in general to the poor, without naming particular trustees, they fall under the administration of the Court of Session. By the statute 1683, c. 6, it was declared unlawful to alter any mortifications, and the managers were rendered liable to be called to account for malversation. Any person entitled to the benefit of the fund can pursue actions of this kind.

**MORTIFICATION**, in Medicine. See **INFLAMMATION.**

**MORTIS CAUSA DEED**, in Scotch Law, is a deed which is made with a view to come into effect on the death of the maker. Since in Scotland land cannot be conveyed by will, as in England, it is necessary to execute an ordinary deed of conveyance, and to reserve the maker's liferent, and to keep it in his own possession until his death—i. e., to suspend its effect during the life of the grantor.

**MORTISE AND TENON** (Fr. *mortaise*, probably from Lat. *mordere*, to bite; *tenon*, from *tenir*, to hold), a form of joint in Carpentry. The tenon is a projection, generally rectangular in form, on the end of a piece of wood, cut so as to fit exactly into a deep groove (called the mortise) cut in another piece, so that the two are united at a required angle. The framing of doors, shutters, and such pieces of joinery, is usually fitted together with mortise and tenon joints.

**MORTMAIN**, the Statutes of (Fr. *mort*, dead, and *main*, hand). The object of the statutes of mortmain is to prevent priests and other persons from importuning a

dying man to convey his land for charitable purposes. Hence, though a person can, up to the last hour of his life, if possessing sufficient knowledge of what he does, devise by will all his land to individuals absolutely, it is otherwise if he intend to give the land to trustees for a charitable purpose, as to build a church, or school, or hospital. The statute of mortmain, 9 Geo. II. c. 36 (1736), reciting that public mischief had greatly increased by many large and improvident dispositions made by tanguishing and dying persons to charitable uses, to take place after their deaths to the disinherison of their lawful heirs, enacted, that in future no lands or sums of money to be laid out in land should be given to any person or body, unless such gift or conveyance should be made or executed in presence of two witnesses twelve months before the death of the donor or grantor, and be enrolled in the Court of Chancery within six months after the execution. Therefore, a person on death-bed cannot in England give land, or money to buy land, for a charitable purpose. It can only be done in the life of the donor, at least twelve months before his death; and the property must be completely alienated, so that he has no further control over it. The deed must have a present operation, and must not reserve any life-interest to the donor; it must be done at once and for ever. The policy of this statute has sometimes been questioned, and several well-known modes evading the statute have been adopted from time to time. The act has been held to apply only to land locally situated in England; and hence, if the land is situated in Scotland, or the colonies, or abroad, a will conveying it for charitable purposes will receive effect. In Scotland, the mortmain act had no application; but it was not needed, as the common law of Scotland also put a similar check on the alienation of land on death-bed, which, however, has been abolished by statute. See **DEATH-BED, ILTESTACY**.

**MORTON**, Samuel George, M.D., an American physician and ethnologist, son of an Irish emigrant, was born in Philadelphia, January 28, 1799. He studied medicine in Philadelphia, Edinburgh, and Paris, and in 1824 settled in Philadelphia, where he contributed papers on physiology and craniology to scientific journals. In 1824, he visited the West Indies, and made observations on the development of races. In 1829, he was appointed Professor of Anatomy in the Pennsylvania Medical College, and published his great work, "*Crania Americana*," based on his collection of 867 classified skulls. In 1844, he published "*Crania Egyptiaca*," based on the collection of George R. Gliddon, Esq.; and in 1849, his last work, "*An Illustrated System of Human Anatomy, Special, General, and Microscopic*." He died at Philadelphia, May 18, 1851. M. may be regarded as the first American who endeavored to place the doctrine of the original diversity of mankind on a scientific basis. See the Memoir of M. prefixed to Nott and Gliddon's "*Types of Mankind*" (Philadelphia, 1854), a work largely illustrated by selections from his unedited papers.

**MORTON**, Fourth Earl of (James Douglas), regent of Scotland, was the second son of Sir George Douglas of Pittendreich, and in 1558 succeeded, in right of his wife, Elizabeth, daughter of the third earl, to the title and estates of the earldom. He early favored the cause of the Reformation, and in 1557 was one of the original Lords of the Congregation. Sworn a privy councillor in 1561, he was appointed Lord High Chancellor of Scotland, January 7, 1563. Having been one of the chief conspirators against Rizzio, the Italian secretary of Queen Mary, on his assassination, 9th March 1566, he fled with his associates to England, but, through the interest of the Earl of Bothwell, soon obtained his pardon from the queen. Though privy to the design for the murder of Darnley, on the marriage of the queen to Bothwell, he joined the confederacy of the nobles against her. He was present at Carberry Hill, when Bothwell parted from the queen, and after Mary's imprisonment in the Castle of Lochleven, he was restored to the office of High Chancellor, of which he had been deprived, and constituted Lord High Admiral of Scotland. On the death of the Earl of Mar, in October 1572, he was elected regent of the kingdom. His rapacity and avarice made him obnoxious to many of the nobles, and as the young king, James VI., desired to assume the reins of government, Morton resigned the regency in March 1578. Subsequently obtaining possession of the castle of Stirling, with the person of the king, he recovered

Mosaic  
Mosaicisms

his authority, but was accused of participating in the murder of Darnley, and being tried and condemned, was beheaded at Edinburgh, June 2, 1561.

**MOSAIC**, the art of producing artistic designs by setting small square pieces of stone or glass of different colors, so as to give the effect of painting. Both the origin of the art, and also of its name, are buried in obscurity; it was, however, much practised by the ancient Romans, especially for ornamental pavements, specimens of which are almost always found whenever the remains of an old Roman villa are discovered. Under the Byzantine empire, it was also much used for the ornamentation of churches, in which it formed a large portion of the wall-decoration. It was re-introduced into Italy for the latter purpose about the middle of the 13th c. by Andrea Tafi, who learned it of some Greek artists employed at Venice in decorating St Mark's. Since then it has been especially an Italian art, and to such wonderful perfection has it been brought, that most minute pictures are produced by it. Within quite recent years, mosaics of surpassing beauty, both in design and material, have been produced by Russian artists in the Imperial Glass Manufactory of Russia; those shewn in the Russian department of the International Exhibition (1882) have probably never been surpassed. The pieces of glass of every shade of color are technically called *smalts*; they are generally opaque, and are set in cement in the same manner as tiles or pavement. Some fine pieces of mosaic pavement have lately been produced in this country by Messrs Minton & Co., of Stoke-upon-Trent, and by Messrs Maw of Brosely, proving that the art only wants sufficient encouragement to obtain a high position. In Italy there are two very distinct varieties of mosaic work—i. e., the Florentine and the Roman; the former is entirely formed of pieces of stone or shell of the natural colors, and is limited in its application chiefly to floral and Arabesque designs. The latter is made of the glass *smalts* mentioned above, and has so wide an application, that most of the finest paintings of the best old masters have been copied in mosaic, and the pictures so taken form the almost imperishable decorations of the finest churches of Italy. The manufacture of the opaque glass or *smalts* for making the little square pieces called *tesserae*, of which the pictures are composed, is a very important one, and is carried on in the Vatican, where 25,000 shades of the various kinds of colored glass are produced.

**MOSAIC GOLD.** See TIN.

**MOSAIC WOOL**, or Wool Mosaic, is a remarkable application of the principle of mosaic-work to the production of woollen or worsted rugs and carpets, having a definite design or pattern, independent of the ordinary processes of printing and weaving. Many attempts in this direction have been made, chiefly on the continent; but the most successful is that of Messrs Crossley, in whose extensive carpet factory at Halifax the mosaic wool is produced as a regular department of manufacture.

In the first place, well-spun worsted threads are dyed to every color and almost every shade or tint, amounting to a hundred varieties in all. An artist prepares a full-sized drawing of the pattern or design, ruled all over with cross-lines; this is copied on lined paper by girls, each of whom takes as much of the pattern as will fill a square foot. A workman (or woman) having a good eye for color, examines each square piece of drawing in detail, and selects the proper color of thread suitable to every portion of it; the threads are a little over 200 inches long each, or about 17 feet, and are numerous enough to pack closely together into a mass of one square foot in width and depth. A strong iron framework, 17 feet long, is so arranged that all these threads can be stretched on it horizontally, tied at one end, and weighted with 4 lbs. to each thread at the other. Girls, under the direction of the work-woman who selects the colors, arrange these threads one by one, tying them at one end, weighting them at the other, and supporting them on a steel bar in the middle. This being done, the mass of 17 feet in length is cut up into blocks of 20 inches long each, for convenience in after-operations. All these processes are for one square foot only of the pattern, and they have to be repeated as many times as there are square feet in it. Supposing a rug 6 feet by 2, with a lion, tiger, or other device occupying the greater part of the surface: there must be twelve masses prepared, and as each mass contains 50,000 threads, there will be 600,000 altogether. Blocks are cut from each mass, and are placed in an iron box or frame, side by side; thus forming a quadrangular solid 6 feet by 2, and 20 inches deep, with the threads arranged *vertically*. Now, to convert this into a great number of separate rugs, the pattern of which is

seen represented on the upper surface, formed by the ends of the colored threads, india-rubber is dissolved in camphine to the consistence of carpenters' glue, and brushed well over the top, so that every individual thread shall receive its portion; this being dried, a second coating is applied, and afterwards a third. A backing of canvas, or of some kind of strong cloth, is cemented down upon the mass of threads by a glue of the same kind, and is scraped and rubbed until it adheres to every individual fibre. When dry, the mass of threads is raised up three-sixteenths of an inch, by a screw acting upon a movable bottom to the box. A very keen circular cutter, 12 feet in diameter, and rotating 170 times per minute, quickly severs a horizontal slice three-sixteenths of an inch thick, the box of threads being caused by an endless screw to travel onwards to meet the cutter. This slice, when turned up, presents the picture complete, in a beautifully soft nap or pile of woollen threads, supported by a canvas or woollen backing. It is a mere question of hand-work to convert this into a rug, carpet, coverlet, or wrapper of any kind. A second repetition of the same processes converts another slice into a second rug; and so on until the mass of 20 inches in depth has been cut up into about a hundred slices, each forming one rug. As the blocks of 20 inches were originally cut from a mass of 200 inches, the whole mass produces about a thousand rugs, all exactly the same pattern. It is this power of repetition which makes the process pay; for the great preparatory labor of selecting and arranging (say) 600,000 distinct threads could not otherwise be compensated for.

MOSAYLIMA (Little Moslem), one of the most important rivals of Mohammed, belonged to the clan Dûl, a division of the tribe of the Bani Hanifah, of Yamâma in Nedjed. The traditions about his life and age are extremely contradictory and legendary. It appears, however, tolerably certain that he had risen to a certain eminence in his tribe, probably as a religious teacher only at first, before Mohammed assumed his prophetic office. The name he was known by among his friends was Rahmân, the Benignant or Merciful; a term which Mohammed adopted as a designation of God himself. This word, which is *Armaic*, was a common divine epithet among the Jews, from whom Mohammed took it, together with a vast bulk of dogmas, and ceremonies, and legends. If, however, M., as is supposed by some, assumed that name in the meaning of Messiah, Saviour, it would prove that he had anticipated Mohammed in the apostleship, which is commonly denied. It was in the ninth year of the Hedjrah that M., at the head of an embassy sent by his tribe, appeared before Mohammed, in order to settle certain points of dispute. The traditions are very contradictory on the circumstance whether or not M. was then already the recognised spiritual leader of his tribe. When they were introduced to Mohammed in the mosque, they greeted him with the orthodox salutation of Moslems—viz., "*Salâm alayk*" (Peace upon thee), and after a brief parley, recited the confession of faith. Shortly after this event, M. openly professed himself to be a prophet, as well as Mohammed. The latter sent a messenger to him, as soon as he heard of this, to request him to reiterate publicly his profession of Islam. M.'s answer was a request that Mohammed should share his power with him. "From Mosaylima, the Apostle of God," he wrote, according to Abufeda, "to Mohammed, the Apostle of God. Now let the earth be half mine, and half thine." Mohammed speedily replied: "From Mohammed, the Apostle of God, to Mosaylima, the liar. The earth is God's: He giveth the same for inheritance unto such of his servants as He pleases, and the happy issue shall attend those who fear Him." Yet notwithstanding these testimonies, of probably late dates, it seems, on the other hand, perfectly certain that Mohammed made very great concessions to his rival—concessions that point to his having secretly nominated M. his successor, and that he by this means bought M.'s open allegiance during his lifetime. It was not a question of dogmas, though they each had special revelations, but a question of supremacy, which was thus settled amicably. "Mohammed," M. said, "is appointed by God to settle the principal points of faith, and I to supplement them." He further had a revelation, in accordance with Mohammed's: "We have sent to every nation its own prophet," to the effect: "We have given unto thee [M.] a number of people; keep them to thyself, and advance. But be cautious, and desire not too much; and do not enter into rival fights."

When Mohammed was at the point of death, he desired to write his will. Whatever he may have wished to ordain, is uncertain; it is well known, at all events, that his friends did not obey his order, and refused to furnish him with writing-

materials, very probably because they did not like to be bound by his last injunctions. Sprenger supposes that he wished formally to appoint M. his successor, and that it was just this which his surrounding relations feared. M. then openly declared against Islam, and many parodies of the Koran sprang up in the Nedjed, ascribed to him. In the 11th year of the Hedjrah, it at last came to an open breach between the two rival powers. Abu Bekr, the calif, sent Khalid, "the Sword of the Faith," with a number of choice troops, to compel M. to submission. M. awaited the enemy at Rowdah, a village in the Wadi Hanifah. So formidable indeed was M.'s force, that Walid is said to have hesitated for a whole day and night before he undertook an assault unanimously disapproved of by his council. On the second morning, however, he advanced, and in a battle which lasted until the evening, contrived, with fearful losses of his own, to gain the victory. M. fell by the hands of a negro slave, and his head was cut off by the conqueror, and placed at the head of a spear, to convince both friends and foes of his death. Khalid then advanced to the slain prophet's birthplace, in order to slay all its inhabitants. They, however, by a clever stratagem contrived to conclude an honorable peace, but had to embrace Islam. The Mosleyman "heresy" was thus stamped out, and only a few scattered remnants of the new faith contrived to escape to Hassa and Basrah, where they may have laid the foundation of the later Karimathian creed.

It is extremely difficult to come to any clear notion of M.'s real doctrines, as all the accounts that have survived of them come from victorious adversaries—adversaries who have not hesitated to invent the most scandalous stories about him. Thus, a love-adventure between M. and the prophetess Sajjah, the wife of a sooth-sayer of Yamama, who is supposed to have stayed three days in his tent, is told with great minuteness, even to the obscene conversation that is supposed to have taken place between them during that time; the fact being that this story, which is still told with much relish by the natives, is without the slightest foundation. From the same source, we learn that M. tried to deceive his followers by conjuring tricks. It seems, on the contrary, that M. was of much higher moral standing than Mohammed himself. Thus, he is said to have enjoined the highest chastity even among married people: unless there was hope of begetting children, there should be restriction of conjugal duty. Even the nickname "Little Moslem," given to him seems to indicate that he, too, preached the unity of God, or Islam, as the fundamental doctrine of faith. How far his religion had a socialist tendency, and offered less show of dignity and outward morality to its followers, or whether it rejected fatalism, contained an idea of incarnation, and invested its preachers and teachers with a semi-mediatorial character, as the latest explorer of the Nedjed, Mr Palgrave tells us, we have no means of judging. But we must receive these conclusions, probably drawn from the information of the natives, with all the greater caution, as that story of the prophetess Sajjah, whom he reports, after his informants, not only to have been properly married to M., but to have, after his death, become a devout partisan of Islam, and to have entered an "orthodox alliance," does not, as we said before, deserve the slightest credence.

MOSCOW, an important government of Central Russia, lies immediately south of the governments of Tver and Vladimir. Area, 12,553 sq. m.; pop. (1870) 1,772,024. The surface is level with the exception of a tract in the south-west, which is elevated. It is watered by the Moskva and the Klazma, while the Oka forms a portion of its southern boundary. The soil, principally clayey, with some sandy and stony tracts, is, on the whole, unfertile, and barely supplies local consumption. Few of the governments of Russia, however, equal that of M. in manufactures and general industry. It contains numerous cloth, silk, brocade, chintz, paper, and other factories. China-ware is manufactured from the clay dug up in the district of Gjelak. Many of its villages carry on special branches of manufacture, of which pins, glass beads, and small looking-glasses for Asia is one. White limestone is quarried, and is much used for building in the capital; yellow marble quarries occur on the banks of the Oka. Peat is extensively used as fuel in the factories. Among the places historically celebrated are the monastery of St Sergius, founded by one of the first Muscovite princes, and famous for its silver shrine, said to be the richest in the world; and the village of Borodino (q. v.).

MOSCOW (Russ. *Москва*), the ancient capital of Russia, and formerly the real-

dence of the Czars, is situated in a highly-cultivated and fertile district on the Moskva, 400 miles south-east of St Petersburg, with which it is in direct communication by railway. Lat.  $55^{\circ} 40'$  n., long.  $37^{\circ} 33'$  e. Pop. (1871) 601,970. Previously to its being burned in 1812, M. was perhaps the most irregularly built city in Europe, and that distinction to a great extent it still retains; for, as the main object in 1813 was to build speedily, the streets rose again on the old model, undulating and crooked, and consisting of alternating houses, the most varied in character and pretensions. Many improvements have, however, been recently accomplished in the city. Gas-pipes have been laid along the streets; letter-boxes are placed at frequent intervals; the Romanzoff Place, formerly so dirty, has been converted into a splendid square, with an ornamental garden, and the old obelisk, the former monument of the Place, standing in the centre, with water fountains on each side. The general view of the town, especially that obtained from an eminence on its southern side called the Sparrow Hills, is eminently original and picturesque. Its hundreds of churches and convents, surmounted by gilt or variously-colored domes; its gardens and boulevards; and, above all, the high walls and crowded yet stately towers of the Kremlin or citadel, produce a most striking effect. The Kremlin, situated on the northern bank of the river, forms the centre of the town, and around it, with a radius of about a mile, is a line of boulevards, extending, however, only on the north side of the river. Outside of this line, and concentric with it, is another line of boulevards, with a radius of a mile and a half; while beyond all, and forming the girdle of the city, is the outer rampart, with a circumference of 26 English miles. The Kremlin comprises the principal buildings, as the Cathedral of the Assumption of the Virgin, founded in 1326, a small but gorgeously-decorated edifice; the Cathedral of the Archangel Michael, containing the tombs of all the Czars down to the time of Peter the Great, who changed the royal burial-place to St Petersburg; the Church of the Annunciation, the floor of which is paved with jaspers, agates, and carnelians of various shapes; the tower of Ivan Veliki, 200 feet in height, and surmounted by a magnificent gilded dome, from which, as from all the domes of M., rises the "honorable cross;" the Czar Kolokol (king of bells), the greatest bell in the world; several palaces, and collections of ancient arms and other antiquities; the arsenal, surrounded by the splendid trophy of 860 cannons, taken from the French; and the senate. The walls of the Kremlin are surmounted by 18 towers, and pierced with 5 gates. In the town, the chief buildings are the cathedral of St Vassili, remarkable for its peculiar architecture; the Gostinui Dvor, or Bazaar; and the Exchanges. The Temple of the Saviour, which was commenced in 1812, to perpetuate the memory of the repulse of the French invasion, is not yet completed; but when finished it will be a magnificent architectural feature of this ancient capital. The university of M., the first in Russia, founded in 1758, is attended by 1800 students, and contains a library of 160,000 volumes, museums of natural history, and a botanical garden. As intermediate educational establishments between the parish schools and the university, there are provided 5 high schools or gymnasia for males, and 3 for females; special establishments are the technological, the agricultural, the oriental, 2 commercial, and 3 military schools. There are several learned societies in M., which is also the seat of a metropolitan, one of the three highest dignitaries of the Russian Church. The public museum and library, which was removed from St Petersburg in 1861, occupies a large and handsome building. formerly a palace, is rich, especially in ancient Slavonic MSS., and has about 500,000 vols.

M. communicates by railway with St Petersburg, Nijni-Novgorod, Koslov, &c. It is the seat of an extensive manufacturing and commercial industry; it imports largely, and carries on a considerable export trade, especially with Asia. Its trade is chiefly in hides, leather, oils, wool, grease, isinglass, wax, honey, feathers and down, potash, soap, iron, and copper; cotton from Asia, silks from Georgia, Persia, and Bokhara; Caucasian madder, home and Turkish tobacco, furs, tea, chemicals, and all the products of Russian manufacture, of which M. is the actual centre. The chief manufactures are woollen and worsted goods, silks, brocades, dyeing, printing, tanning and skin-dressing, iron, copper, and silver works, and chandeliers.

M. is of ancient origin for a Russian town. Its site was bought by Yuri Dolgoruki, in the 13th c., and a fortress built. In the 14th c., not only had it become the capital of the Russian religious world, owing to the residence there of the metro-

Moselle  
Moses

278

politan, but it had also become the actual capital of Muscovy. In 1368, 1370, and 1372, it suffered from the inroads of the Lithuanians; in 1381, it was sacked by the Tartars. From 1413 to 1501, it was, on four separate occasions, partially destroyed by fires; and it was burned to the ground by Devlet-Girey, Khan of the Crimean Tartars, in 1571. It was taken by the Poles in 1610, and remained in their possession till their expulsion by the Russians under Minin and Pojarsky in 1612. In 1652, 1659, and 1698, it was the theatre of the revolts of the Strelitz. In 1812, from the 14th September till the 24th October, it was in the hands of the French.

MOSELLE was formerly a frontier department in the north-east of France, but the greater part of it was taken by Germany after the war of 1870—1871. The small portion left to France was joined to the department of Meurthe. Population of M. in 1866, 452,157. It is watered by the Moselle and its tributaries; is richly wooded, and yields abundance of grain, fruits, and wine, though the last is of an inferior quality. Agriculture is in an advanced condition; roads are numerous, and the river-navigation important. Coal, iron, and building-stone are the most valuable minerals. There are also linen, woollen, leather, glass, papier-mâché, and other manufactures.

MOSELLE (Ger. *Mosel*), an affluent of the Rhine, rises in the Vosges Mountains, France, at an elevation of about 2200 feet above the level of the sea, not far from the sources of the Saône. Its course is north-westerly as far as Pont-à-Mousson, in the department of Meurthe, where it becomes navigable; then north to Thionville, near the French frontier; after which it proceeds, in a north-easterly direction (latterly, with many zigzag picturesque windings), through Luxembourg and Rhenish Prussia, joining the Rhine at Coblenz. On its way, it passes the towns of Remiremont, Epinal, Toul, Pont-à-Mousson, Metz, Thionville, and Treves. From Metz to Treves it flows through a broad valley, enclosed by rounded vine-bearing hills. Its entire length is upwards of 380 miles. Its principal tributaries are the Meurthe, the Seille, and the Sarre on the right; and the Orne, the Sure, and the Kyll on the left. The wines grown in the basin of the Moselle are noted for their lightness and their delicate aromatic flavor. The inferior kinds are liable to acidity.

MO'SES (Heb. *Môshêh*; LXX. and Vulg. *Moyse*; ? Egypt. *Mes* or *Measou*; Copt. *Mo usha*, i. e., drawn out of the water), prophet and legislator of the Israelites, born about 1600 B.C. in Egypt (? Heliopolis), during the period of their hard bondage. His father was Amram, his mother Jochebed, both of the tribe of Levi. The tale of his birth and early education has, by tradition (Manetho, Philo, Josephus, Midrash, &c.), received a much more extraordinary legendary character than is found in Exodus; while the main features are, on the whole, the same in them all. And there is no reason to doubt the truthfulness of an account which shews us M., like many other supreme benefactors and "suns" of mankind, struggling against an apparently adverse fate, nay for very life, from the instant of his birth. The well-known narrative, to which late traditions (contained in Philo, Josephus, the Fathers, &c.) have supplied questionable names and dates, is that M.'s mother, unable to hide the child—which was to have been drowned at its birth—longer than for the space of three months, put it into a basket of papyrus, and hid it among the Nile rushes, Miriam, his sister, watching it from afar. The king's daughter (Thermuthis, or Meris), coming down to the river, observed the weeping child, and was so struck with its beauty, that she allowed Miriam to fetch a Hebrew nurse, Jochebed. Grown up, he was sent to the king's palace (Heliopolis) as the adopted son of the princess, and here seems to have enjoyed not only princely rank, but also a princely education. He is also said to have become a priest, under the name of Osarsiph or 'Iethen, and to have been a mighty adept in all the sciences of "Egypt, Assyria, and Chaldaea;" to have led Egyptian armies against the Ethiopians, defeated them, and pursued them to their stronghold, Saba (Meroe); this place being delivered into his hands by Tharbis, the king's daughter, whom he subsequently married. The Bible contains nothing whatever about the time of his youth. He first reappears there as the avenger of a Hebrew slave, ill-treated by an Egyptian overseer. Threatened by the discovery of this bloody act, he escapes into Midian, where he is hospitably received by Jethro, the priest, and married his daughter, Zipporah. He stayed for many years in Midian, tending the flocks of his father-in-law. This most sudden transition from the brilliant and refined life of an Egyptian court, of which

he had been brought up a prince, to the state of a poor, proscribed, exiled shepherd, together with the influences of the vast desert around him, must, in M.'s mind, have produced a singular revolution. The two names which he gave to his sons, strikingly express part of what filled his soul—a feeling of gratitude for his salvation from the avenging hand of justice, and the deep woe of his exile. The fate of his brethren went now to his heart with greater force than when he was a prince and near them. There rushed upon his memory the ancient traditions of his family, the promises of Jehovah to the mighty sheikhs, his forefathers; that they should become a great and a free nation, and possess the ancient heritage of Canaan; why should not he be the instrument to carry out this promise? The *Ehye asher Ehye* (I am that I am) appeared to him while his mind was occupied with such thoughts, and himself put the office upon his shoulders. A new king had succeeded in Egypt, his old enemies were either dead or had forgotten him, and M. returned to Egypt. Together with Aaron, his brother, the man of small energy but of fine tongue, he consulted about the first steps to be taken with the king as well as with their own people:—both of whom treated them at first with suspicion, nay, with contempt.

After ten distinct plagues (more or less akin to natural phenomena peculiar to Egypt), the last being the death of all the firstborn, Pharaoh consented to let his slaves go free, "that they might serve their God." M. very soon had occasion to prove that he was not only the God-inspired Liberator of his people, who, in the enthusiasm of the moment had braved the great king and his disciplined armies, but that he possessed all those rarer qualities which alone could enable a man to mould half-brutalised hordes of slaves into a great nation. Calmness, disinterestedness, patience, perseverance, meekness, coupled with keen energy, rapidity of action, unflinching courage—"wisdom in council and boldness in war,"—constituted the immense power which he held over the hundreds of thousands who knew no law in their newly-acquired liberty, and who were apt to murmur and to rebel on any or no provocation. Nor were the hostile Bedouin tribes, whose territories the new emigrants approached, easily overcome with untrained warriors, such as formed the ranks of M.'s army. The jealousy of certain elders fostering seditious within, added to his unceasing vexations; and to all the measure to overflowing indeed, his own brother Aaron, whom he had made his representative during his temporary absence on the Mount of Sinai, himself assisted in the fabrication of an idol. His sacred office as legislator, he in reality first assumed in the third month after the Exodus, when, after many hard and trying marches and countermarches—from Goshen to Succoth (? Latopolis, the present old Cairo); thence by a *detour*, to Etham (? Ramleh), Pi-hachiroth (? Bedra), through the Red Sea, to the Desert of Shur (? Al-Djofar), Marah, Elim (Wadi Gharaudel), Desert of Sin (Wadi Mocattib), or (Wadi Al-Sheikh), Dophka, Alus, Raphidim (near the Makkad Sidna Moussa)—made more trying by want of food and of water, by encounters with Pharaoh and the Amalekites, having arrived near the Mount of Sinai, he made the people encamp all round, and ascended the summit of the mountain by himself. On the incidents connected with the "Revelation" made to the whole people, we need not dwell any more than on any other part of this well-known narrative. Suffice it to point out briefly, that the tendency of the whole Law was to make the Hebrews a people "consecrated to the Lord," "a holy people, and a kingdom of priests," i. e., a people of equals both before God and the Law. Three distinct parts compose this Mosaic Constitution. The doctrine with respect to God and His attributes; the "Symbolical" Law, as the outward token of His Doctrine; and the Moral and Social Law. The Decalogue forms a kind of summary of all the three; the existence of Jehovah as the Absolute Being, the liberation of the people and the prohibition of Polytheism, and the Representation of the Divinity by visible images (I—iii.). While the institution of the Sabbath, the symbol of creation and the Creator, forms the basis of all religious observances (iv.), the remaining part of the laws relate to the intercourse among the members of the human commonwealth; the gratitude of children is inculcated; murder, adultery, theft, false witness, coveting of others' goods are prohibited. The groundwork of these regulations had indeed been a special inheritance in the family of the Abrahamites from the earliest times; but the vicissitudes of fortune, the various migrations, and the enormous increase of this family, and its being mixed up for long years with the surrounding idolaters,

Moshe'm  
Mososaurus

280

had obliterated nearly all traces of the primeval purity of creed in the populace. The wisdom displayed even in the minor regulations of the Mosaic dispensation, with respect to their adaptation to the peculiarity of the race, the climate, the political state of the country which they were to inhabit; in the hygienic regulations, and the rules which treat of the social and domestic relations; and, above all, the constantly-reiterated caution from mixing again with other nations, such as they found them in Canaan—and the neglect of which subsequently proved their ruin—is traced to a direct influence of Jehovah, generally indicated by the words, "And God spake to Moses, speak unto the children of Israel." An ample Ritual, in connection with the Tabernacle, or constantly-visible symbol of a Divine Dwelling; the allegory of an ever-new covenant represented by Sacrifices, Prayers, Purifications, kept the supreme task of being priests and a holy people unceasingly before the eyes of the nation. The tribe of Levi (q. v.), to a certain degree acted in this respect as permanent representatives; and not to Moses's sons, but to his brother Aaron and his descendants, was intrusted the office of High-priest.

When on the eve of entering into the promised land, the people broke out in open rebellion, and threatened, by a spontaneous return to the land of slavery, to undo the entire work of M.'s life. Convinced that they were not as yet fit to form a commonwealth of their own, the Liberator and Lawgiver had to postpone, for the long space of 40 years, the crowning act of his work; and, in fact, did not himself live to see them taking possession of the hallowed territory. How these years of nomadic journeying through the Desert (El-Tyh or Al-Tyh Beni-Israel) were spent, save in rearing up a new generation of a more manly and brave, as well as more "civilised" stamp, we can only conjecture. All those who had left Egypt as men were doomed to die in the desert, either by a natural death, or by being suddenly "cut off," in consequence of their openly defying M., and through M., Jehovah. The apparent lack of incidents during this period has indeed furnished grounds for various speculations on this subject, and critics have tried to reduce it to a much shorter space, without, however, being able to prove their point. Even Goethe, with more ingenuity than knowledge of the subject, has endeavored to prove the "forty" to be a mythical round number, the real time being two years. The testimonies of the Hebrew prophets and historians, however, are perfectly unanimous on the subject (cf. Jos. v. 6; xiv. 10; Amos, ii. 10; v. 26; Ps. xcv. 10, &c.), and modern criticism has mostly endorsed the number as in keeping with the circumstances. On the first month of the fortieth year after the Exodus, we find M. at the head of an entirely new generation of Hebrews at Kadesh, in the Desert of Phoran or Zin. Here his sister Miriam died. Here also, for the first time, M., seeing the new generation as stubborn and "hard-necked" as their fathers, is recorded to have despaired of the Divine Providence; and his disobedience to the letter of the command given to him, "to speak to the rock," is alleged as the reason "that his bones too had to fall in the desert." His brother Aaron died at Hor (near Petra, according to Josephus and St Jerome), whither the Israelites had gone next. Not long afterwards, M. once more had occasion to punish with relentless severity the idolatrous tendencies of the people (Baal Peor), thus shewing that age had had no power of making him relax his strong rule over the still half-savage and sensuous multitude. Having finally fixed the limits of the land to be conquered, and given the most explicit orders to Joshua, to Eliezer, and the chiefs of the ten tribes respecting its division, he prepared the people for his own impending death. He recalled to their minds in the most impressive language, their miraculous liberation, and no less miraculous preservation in the desert. Their happiness—their life—was bound up, he told them, in the divine Law, communicated through him by Jehovah. A recapitulation of its principal ordinances, with their several modifications and additions and reiterated exhortations to piety and virtue, form the contents of his last speeches, which close with one of the grandest poetical hymns. The law was then handed over to the priests that they might instruct the people in it henceforth; Joshua was installed as successor (while his own sons sunk into the obscurity of ordinary Levites), and he blessed the whole people. He then ascended the Mount of Nebo, from whence he cast a first and last look upon the land towards which he had plied all his life, and on which his feet were never to tread. He died upon this mountain, 120 years old, in the full vigor of manhood, according to the Scriptures, "and no man knew his

burial-place up to this day"—so that neither his remains nor his tomb were decorated by "Divine honors" being superstitiously paid to them.

This is a summary of M.'s life as derived from biblical as well as non-biblical sources. The latter—except, perhaps the very doubtful traditions of Manetho—be- long, whatever may be the date of the respective documents of the Pentateuch, to a much later age, and bear the air of tradition and legend, grown out of those very documents, so plainly on their face, that they are of about the same importance for historical purposes as the cycle of Midrashasagas that have gathered around M., and which are reproduced variously in Moslem Legendaries. On his office as a "prophet"—what was the special nature of his revelations, how far the doctrines promulgated by him were traditional among the Abrahamites, and how much of his laws is due to Egyptian influences; whether part of them was first inaugurated by later generations and ascribed to him, or whether others were never carried out at all: on these and similar questions which have been abundantly raised, more especially in recent times, we must refer for fuller information to the special works on the subject. Some notices of the more important points will be found under GENESIS, JAWS, PENTATEUCH, DECALOGUE, &c. There seems, however, but one conclusion. The brief span of human history of which we have any knowledge, shews few, if any, men of M.'s towering grandeur—even with all the deductions that the most daring criticism has yet proposed.

MOSHEIM, Johann Lorenz von, a distinguished church historian of Germany, was born at Lübeck on 9th October 1694, and studied at Kiel. In 1723, he became ordinary professor of theology at Helmstedt, from which he was removed in 1747 to a similar office in Göttingen. He died Chancellor of the University of Göttingen, 9th September 1755. His theological works are numerous, amongst which are a work on Bible morality, "Sittenlehre der Heiligen Schrift" (new ed., continued by J. P. Miller, 9 vols. Helmst. 1770—1778); and Discourses, "Heiligen Reden" (3 vols. Hamb. 1732, et seq.). But his most important contributions to theological literature are in the department of ecclesiastical history, in which his "Institutiones Historiæ Ecclesiasticæ" (Helmst. 1755) is familiar to every student as a work of great learning, fulness, and accuracy. It has been translated from the original very elegant Latin into English and other languages. The best English translation is that by Dr James Murdock (3 vols. New York, 1832), of which there are many reprints. Besides this, M. is the author of "Institutiones Historiæ Christianæ Majoræ" (Helmst. 1763); "De Rebus Christianorum ante Constantinum Commentarii" (Helmst. 1753); "Dissertationes ad Hist. Ecclesiasticam pertinentes" (2 vols. new ed. Altona, 1767); and "Versuch einer unparteiischen Ketzergeschichte" (2 vols. Helmst. 1746—1748). His stand-point is that of liberal orthodoxy; yet he is essentially *dogmatic*, and pays more regard to the mere "opinions" of men than to the character and genius shining through them; hence, his "Church History" is far inferior in point of richness, depth, and suggestiveness to that of Neander.

MOSEKWA, a river of European Russia, a branch of the Oka, which is itself a branch of the Volga. It is celebrated in history for the great battle, called the battle of Borodino (q. v.), fought on its banks, 7th September 1812, from which Ney (q. v.) obtained his title Prince of Moskwa. The M. rises in a marsh in the government of Smolensk, passes close by the towns of Moshalsk and Svenigrod, passes through the city of Moscow, and joins the Oka near Kolomna, in the government of Moscow. The whole length of its course is about 220 miles. A considerable commerce is carried on by boats on the M., and it is directly connected with the Volga by the M. Canal.

MOSOSAURUS (MUSE LIZARD), a genus of huge marine lizards, whose remains occur in rocks of cretaceous age. Three species are known, one from the upper chalk of Sussex, a second from the cretaceous beds of North America, and the third from the Maestricht beds. This last (*M. Hofmanii*) was first known from a nearly perfect head dug out of St Peter's Mount in 1790, and popularly called the great animal of Maestricht. Originally the property of Hofman, it was taken from him, in virtue of some clause in their charter, by the ecclesiastical authorities of Maestricht, who, in their turn, were compelled to give it up to the victorious French army, and by them it was removed to Paris. It is said that the French cannoniers, when preparing for the siege, had instructions not to point the artillery towards that

part of the town in which the precious specimen was deposited. This head is four feet in length, and the animal to which it belonged is estimated to have been 25 feet long. The total number of the vertebrae was 133; they were concave in front and convex behind, and were fitted to each other by a ball-and-socket joint, admitting of easy and universal flexion; the sacrum seems to have been wanting. The limbs were developed into four large paddles, and these with the comparatively short and strong tail, the bones of which were constructed to give great muscular power, enabled the animal to move quickly through the water in pursuit of its prey. The jaws were furnished with a single row of strong conical teeth. Cuvier first shewed the affinities of the animal. It is most nearly related to the modern monitor, but differs from all modern lizards in its peculiar adaptations for an ocean life, and in its great size. The largest living lacertian is only five feet in length, and of this a large proportion is made up by the tail; the *M.*, with its short tail, is estimated to have been at least 25 feet long.

**MOSQUE**, a Mohammedan house of prayer. The word is derived, through the Italian *moschea*, from the Arabic *masjid*, a place of prayer. The form of the oldest mosques (at Jerusalem and Cairo) is evidently derived from that of the Christian Basilica, the narthex being the origin of the court, with its arcade, and the eastern apses representing the principal buildings of the mosque facing Mecca. The original forms became, however, entirely obliterated in the progress of Mohammedan architecture, and the mosques, with their arcaded courts, gateways, domes, and minarets, became the most characteristic edifices of Saracenic art. Wherever the Mohammedan faith prevailed, from Spain to India, beautiful examples of these buildings exist. They vary considerably in style in different countries, the Saracens generally borrowing much from the architecture of the various nations who adopted their faith. In India, the mosques have many features in common with the temples of the Jains, while in Turkey they resemble the Byzantine architecture of Constantinople. Everywhere the dome is one of the leading and most beautiful features of the mosques, which commonly consist of porticoes surrounding an open square, in the centre of which is a tank or fountain for ablution. Arabesques and sentences of the Koran inscribed upon the walls, which are generally white-washed, and never bear any device representing a living thing, are the only ornaments of the interior. The floor is generally covered with mats or carpets; there are no seats. In the south-east is a kind of pulpit (*Mimbar*) for the Imam; and in the direction in which Mecca lies (the Kibleh), there is a niche (*Mehrab*) towards which the faithful are required to look when they pray. Opposite the pulpit, there is generally a platform (*Dikka*), surrounded by a parapet, with a desk bearing the Koran, from which portions are read to the congregation. The five daily prayers (see **MOHAMMEDANISM**), which are generally said at home—especially by the better classes—on week-days, are said in the mosque by the whole congregation on Fridays, the days of *Al-Ghumah*, or the Assembly, the Moslem Sundays, together with some additional prayers, and at times a sermon is superadded to the service. It is not customary for women to visit the mosques, and if they do, they are separated from the male worshippers. The utmost solemnity and decorum are preserved during the service, although in the hours of the afternoon (when there is no worship) people are seen lounging, chatting, even engaged in their trade, in the interior of the sacred building. On entering the mosque the Moslem takes off his shoes, carries them in his left hand, sole to sole, and putting his right foot first over the threshold, he then performs the necessary ablutions, and finishes by putting his shoes and any arms he may have with him upon the matting before him. The congregation generally arrange themselves in rows parallel to that side of the mosque in which is the niche, and facing that side. The chief officer of a mosque is the *Nazir*, under whom are two *Imams*, a kind of religious official, in no way to be compared with what we understand by a clergyman of a creed, but who performs a certain number of religious rites as long as the *Nazir* allows him to do so, and who, being very badly remunerated, generally has to find some other occupation besides. There are further many persons attached to a mosque in a lower capacity, as *Mueddins* (q. v.), *Bowwabs* (door-keepers), &c., all of whom are paid, not by contributions levied upon the people, but from the funds of the mosque itself. The revenues of mosques are derived from lands. With many of the larger mosques there are schools, academies

(Medressehs), and hospitals connected, and public kitchens, in which food is prepared for the poor.

**MOSQUITO** (Span. *gnat*), a name very generally given to the most troublesome species of *Culex*, and allied genera. See **GNAT**. The name *M.* is given, according to Humboldt, in some parts of tropical South America to species of *Simulia*, which are active during the day, whilst species of *Culex*, active chiefly during the night, are called *Zancudo*s; but these latter are the mosquitoes of other countries generally. The name was probably first used in the West Indies, where it particularly designates a species (*C. Mosquito*) very similar to the common *gnat*, but not quite so large, with black proboscis, and marked with silvery white on the head, thorax, and abdomen. It abounds in the warm parts of America, especially in marshy districts and in the vicinity of stagnant waters. It and similar species extend even to very northern regions, appearing during the heat of summer in prodigious swarms. Similar species are found also in similar situations in almost all parts of the world, and are almost as great a pest in Lapland as within the tropics. The bite which they inflict is painful, and their incessant sharp buzzing prevents sleep. In India and other countries, beds are provided with *mosquito curtains* of gauze, which are closely drawn, to protect the occupant, while the natives who cannot avail themselves of such protection, smear their bodies with oil. So numerous are mosquitoes in some localities in South America, that the wretched inhabitants sleep with their bodies covered over with sand three or four inches deep, the head only being left out, which they cover with a handkerchief; and travellers have been obliged to have recourse to the same expedient. Even thick clothes afford at best a very partial protection from mosquitoes, being readily penetrated by the proboscis. Mosquitoes are readily attracted to a lamp, and perish in its flame; but where they are numerous, a lamp only causes additional swarms to congregate to its neighborhood until it is extinguished, as is often very soon the case, by their dead bodies.

**MOSQUITO COAST**, Mosquito Territory, or Mosquitia, formerly a native kingdom, under the protectorate of Britain, lies on the east coast of Central America, having Honduras on the north, Nicaragua on the west, and Costa Rica on the south. The area is estimated at 15,000 English square miles, but as 20,000 miles of contested territory lie between it, and Honduras and Nicaragua, its extent would be more correctly given at 25,000 square miles. The coast is low, with many bays and lagoons, and possesses a number of good harbors. The two principal rivers are the Rio de Segovia (which rises within 35 miles of the Pacific Ocean), and the Rio Escondido, both of which flow into the Caribbean Sea. The climate is rainy, and the temperature, considering the latitude, is cool and equal, the thermometer seldom rising above 82° or falling below 71°. On the whole, this territory is one of the most healthy parts of Central America. Ague is not unusually common, epidemics are exceedingly rare, and white people who do not recklessly expose themselves enjoy the best health. The swampy grounds are generally covered with dense forests, in which dye-woods and timber-trees of great value abound. Rice, maize, manioc, and other tropical plants, are cultivated. The country abounds in deer of various kinds, half-wild horses and oxen roam in the savannahs, which are covered with tall grass, and alligators and serpents are common. The chief exports are mahogany, cocoa, ginger, sarsaparilla, and tortoise-shell, but the whole trade is inconsiderable. The inhabitants are of various races, the greater portion being aboriginal, but many are a cross between the native Indians and runaway negroes; they do not number more than from 10,000 to 15,000 in all. Their chief occupations are hunting and fishing, but a little agriculture and cattle breeding are also practiced.

The *M. C.* was discovered in 1502 by Columbus, and though never conquered, was claimed by Spain till about 1660, when the king, with consent of his people, placed himself under the protection of Britain. British colonists at different times attempted to found settlements in various parts of the country, but from various causes were soon after compelled to withdraw. Of late years they have met with more success. The foothold Britain thus obtained in Central America was viewed with great jealousy by the United States, who left no means untried to effect her expulsion. During the British protectorate a sort of constitutional government was established, consisting of a legislative body, and regular jury courts. In July 1850,

the United States and Great Britain bound themselves by the Clayton-Bulwer treaty "not to occupy, fortify, colonise, or exercise dominion over the M. C., or any part of Central America;" and in November 1859, Britain ceded the protectorate of M. C. along with the Bay Islands to Honduras, a proceeding which gave rise to much discontent among the natives of the coast, and a complete rebellion of the islanders. However, by a subsequent treaty, concluded 26th January 1860, the whole territory was finally handed over to Nicaragua.

**MOSESSES** (*Huac*), an order of acotyledonous plants, consisting of mere cellular tissue without vessels, and distinguished from *Hepaticæ* (q. v.), the order with which they are most nearly allied, by having always a leafy stem, and an operculated capsule or urn (*sporangium* or *theca*), which opens at the top, and is filled with spores arranged around a central column (*columella*). The capsule is covered by a hood (*calyptra*); and when it is ripe, and has thrown off the calyptra and operculum, exhibits around its mouth a single or double row of rigid processes, few or numerous, but always either four or a multiple of four, collectively called the *peristome*. These reproductive organs are viewed by many botanists as female flowers or *pistillidia*; whilst reproductive organs of another kind, sometimes found on the same plant, but more generally on distinct plants, are regarded as male flowers or *antheridia*. These are minute cylindrical sacs, occurring in the axils of the leaves, or collected into a head enclosed by variously modified leaves at the summit of the stem, and finally bursting and discharging a great number of spherical or oval vesicles, through the transparent walls of which, when moistened with water, filaments (*spermatozoids*) coiled up within them may be seen wheeling rapidly round and round. As the sacs merely discharge these vesicles and perish, it is supposed that the spermatozoids contained in them may effect the fertilisation of the spore-producing capsules; but this wants confirmation, and their particular office as reproductive organs is not yet fully ascertained.—None of the M. are large plants, many are very small. Many have elongated stems, often branching; others have the stems scarcely developed, so that they seem to consist of a mere tuft of leaves. They are generally social in their manner of growth. They are among the first plants which begin to clothe the surface of rocks, sands, trunks of trees, &c., adapting inorganic matter for the support of higher kinds of vegetation. They love moisture, and are generally more abundant in cold and temperate than in hot climates. They struggle for existence on the utmost limits of vegetation in the polar regions and on mountain-tops. They dry up and appear as dead in a very dry state of the atmosphere, but revive when moisture returns. Some of them grow in bogs, which they gradually fill up and consolidate. They are of great use in protecting the roots of many plants from cold and from drought, and afford harbor to multitudes of insects. Some of them supply food for cattle, particularly for the reindeer, when nothing better is to be obtained, and a wretched kind of bread is even made by some of the dwellers in the Arctic regions, of species of *Sphagnum*. Some are astringent and diuretic, but their medicinal virtues are unimportant. Among the other principal uses to which they are applied by man are the packing of things liable to be broken, the littering of cattle, the covering of garden plants in winter, and the stuffing of the open space in roofs to moderate the heat of attic rooms in summer and their cold in winter—perhaps the most important use to which they are ever put, at least in Britain, and to which, as the benefit is great and easily attained, it is wonderful that they are not much more frequently applied. The abundance of M. in meadows and pastures is disagreeable to farmers. The best remedies are proper drainage, the application of lime, and the liberal use of other manures, by which the soil may be enriched, so that better plants may grow with sufficient luxuriance, upon which the M. are choked and disappear.

Several thousand species of M. are known. Many of the M. are very beautiful, and their capsules and other organs are interesting objects of study, even with an ordinary magnifying-glass.

**MOSTA'R**, a town of European Turkey, capital of Herzegovina (q. v.), on the Narenta, 45 miles south-west of Bosna-Seraï. It is surrounded by embattled walls, contains ten mosques, a Greek church, and a famous Roman bridge of one arch, 26 feet in span. Silk, grapes, and wine are produced, and kulf-blades and weapons are manufactured. M. is also a place of considerable trade. Pop. 18,600.

**MÔ'SUL**, a town of Asiatic Turkey, in the province of Al-Jezireh (ancient Mesopotamia), is situated on the right bank of the Tigris, opposite the ruins of ancient Nineveh (q. v.), and 180 miles up the river from Bagdad. It is surrounded by walls, and is still in a more flourishing condition than most Turkish towns, on account of its caravan-trade with Diarbekir, Bagdad, and Aleppo, though its prosperity is nothing to what it formerly was. During the Middle Ages it supplied all Europe with its rich manufactures—*muslins*, according to Marco Polo, got their name from this town; now, on the contrary, the bazaars of M. are filled with the manufactures of the West. The principal causes of its diminished importance are the rise of Abushehr (q. v.) as an emporium of trade, and the opening up of the new sea-route to India by the Isthmus of Suez. M. is the seat of a Jacobite patriarch, and was formerly the great metropolis of all the Mesopotamian Christians (the Nestorians, the United Chaldeans, the Jacobites, &c.), but war, pestilence, famine, Mohammedan proselytism, oppression, and incessant anarchy, have greatly reduced their numbers. Pop. estimated at from 13,000 to 40,000, of whom about a fourth are Christians; 1500 Jews; the rest Mohammedans (Arabs, Kurds, and Turks).

**MOTAC'LLIDÆ.** See **WAGTAIL**.

**MOTAZILITES**, or *Mutazalites*, a "heretical" Mohammedan sect, dating a few generations after Mohammed, of which brief mention has been made under the heading **MOHAMMEDAN SECTS**. Their name is derived from an Arabic word, denoting "to separate one's self," and originally applied to any special sect or union of men; but the M. becoming the most important and dangerous in Islam, they received this denomination by way of eminence. They were also called *Moattalites*—i. e., those who divest God of His attributes—and *Kadarija*, i. e., "those who hold that man has a free will, and deny the strict doctrine of predestination." The first beginnings of this sect are traced to Mabud, who, in the time of Mohammed himself, already began to question predestination, by pointing out how kings carry on unjust wars, kill men, and steal their goods, and all the while pretend to be merely executing God's decrees. The real founder of the sect, as such, however, is Wasil b. Ata. He denied God's "qualities," such as knowledge, power, will, life, as lending to, if not directly implying, polytheism. As to predestination itself, this he only allowed to exist with regard to the outward good or evil that befalls man, such as illness or recovery, death or life, but man's actions he held to be entirely in his own hands. God, he said, had given commandments to mankind, and it was not to be supposed that He had, at the same time, preordained that some should disobey these commandments, and that, further, they should be punished for it. Man alone was the agent in his good or evil actions, in his belief or unbelief, obedience or disobedience, and he is rewarded according to his deeds. These doctrines were further developed by his disciple, Abu-l-Hudail, who did not deny so absolutely God's "qualities," but modified their meaning in the manner of the Greek philosophers, viz., that every quality was also God's essence. The attributes are thus not without but within Him, and so far from being a multiplicity, they merely designate the various ways of the manifestations of the Godhead. God's will he declared to be a peculiar kind of knowledge, through which God did what He foresaw to be salutary in the end. Man's freedom of action is only possible in this world. In the next, all will be according to necessary laws immutably preordained. The righteous will enjoy everlasting bliss; and for the wicked, everlasting punishment will be decreed. Another very dangerous doctrine of his system was the assumption that, before the Koran had been revealed, man had already come to the conclusion of right and wrong. By his inner intellect, he held, everybody must and does know—even without the aid of the divinely given commandments—whether the thing he is doing be right or wrong, just or unjust, true or false. He is further supposed to have held, that unless a man be killed by violent means, his life would neither be prolonged nor shortened by "supernatural" agencies. His belief in the traditions was also by no means an absolute one. There was no special security, he said, in a long, unbroken chain of witnesses, considering that one fallible man among them could corrupt the whole truth.

Many were the branches of these Motazilites. There were, apart from the disciples of Abu-l-Hudail, of whom we have just spoken, the Jobbaisans, who adopted

Motett  
Motherwell

286

Abu Ali Al-Wahhab's (Al-Jobbâi's) opinion, to the effect, that the knowledge ascribed to God was not an "attribute;" nor was his knowing "necessary;" nor did sin prove anything as to the belief or unbelief of him who committed it, who would anyhow be subjected to eternal punishment if he died in it, &c.—Besides these, there were the disciples of Abu Hashem—the Hashemites, who held that an infidel was not the creation of God, who could not produce evil.—Another branch of the M. were the disciples of Ahmed Ibu Hayet, who held that Christ was the eternal word *incarnate*, and assumed a real body; that there were two gods, or creators, one eternal, viz., the Most High God, and the other not eternal, viz., Christ—not unlike the Socinian and Arian theories on this subject; that there is a successive transmigration of the soul from one body into another, and that the last body will enjoy the reward or suffer the punishments due to each soul; and that God will be seen at the resurrection with the eyes of understanding, not of the body.

Four more divisions of this sect are mentioned, viz., the Jâhedhians, whose master's notion about the Koran was, that it was "a body that might grow into a man, and sometimes into a beast, or to have, as others put it, two faces—one human, the other that of an animal, according to the different interpretations." He further taught them, that the damned would become fire, and thus be attracted by hell; also, that the mere belief in God and the Prophet constituted a "faithful."—Of rather different tendencies was Al-Mozdar, the founder of the branch of the Mozdarians. He not only held the Koran to be uncreated and eternal, but so far from denying God the power of doing evil, he declared it to be possible for God to be a liar and unjust.—Another branch was formed by the Pasharians, who, while they carried man's free agency rather to excess, yet held that God might doom even an infant to eternal punishment—all the while granting that He would be unjust in so doing.—The last of these Motazilite sectarians we shall mention are the Thama-mians, who held, after their master, Thamâm, that sinners would undergo eternal damnation and punishment; that free actions have no producing author; and that, at the resurrection, all infidels, atheists, Jews, Christians, Magians, and heretics, should be returned to dust. We cannot, in this place, enlarge upon the different schools founded by the M., nor upon their subsequent fate. The vast scientific development, however, which their doctrines begot, and which resulted in the encyclopædic labors called "The Treatises of the Sincere Brethren and True Friends," are touched upon under *SINCERE BROTHERN* (q. v.).—See Weil, "Geschichte der Khalifen;" Sale's "Koran;" Steiner, "Mutaziliten;" Dieterici, "Transactions of the German Oriental Society," &c.

**MOTETT**, a name applied to two different forms of musical composition—1. A sacred cantata, consisting of several unconnected movements, as a solo, trio, chorus, fugue, &c.; 2. A choral composition, generally also of a sacred character, beginning with an introduction in the form of a song, perhaps with figurative accompaniment; after which follow several fugue subjects, with their expositions, the whole ending either with the exposition of the last subject, a repetition of the introduction, or a special final subject. A motett differs in this respect from a double or triple fugue, that the subjects never appear simultaneously, but are introduced one after the other. In one form of the motett, the successive phrases of an entire chorale are treated as so many fugal subjects.

**MOTH**, the popular name of all the insects included in the section *Nocturna* of the order *Lepidoptera* (q. v.). They formed the genus *Phalena* of Linnaeus, but are now distributed into many genera and families, the species being extremely numerous. Among them are the very largest *Lepidoptera*, and also the smallest. They are distinguished from Hawk-moths, and from most of the butterflies, by their bristle-shaped antennæ tapering from base to apex. The antennæ are frequently feathered or pectinated, especially in the males. The proboscis is generally similar to that of butterflies; but there are some groups of moths in which it is merely rudimentary, and these are supposed to take no food after they pass from the larva state. The thorax is generally shorter and more robust than in butterflies; the tibiae of the legs often bear a kind of spur; the wings are held either in a horizontal or in an inclined position when at rest; or, as in many of the smaller moths, are wrapped round the body. The two wings of the same side are generally hooked together in repose by means of bristles on the margin. The females of a few species are wingless.—*Moths*

are generally nocturnal, although to this rule there are a few exceptions. They often exhibit great richness and beauty of colors, although in brightness of color they are not generally equal to butterflies. Their food is similar to that of butterflies.—They lay great numbers of eggs, which exhibit varieties of form and color as great as those of the insects themselves. Their caterpillars are more widely various in form and characters than those of butterflies; differing from each other in the number of their legs, and in horns, protuberances, caudal appendages, hairy covering, &c. Some are social both in the larva and chrysalis state; forming, on their entering the latter state, very curious nests. The chrysalis of a moth is never angular nor furnished with protuberances, and is generally enveloped in a silken cocoon, pretty close and compact; although some moth chrysalids are found in a mere space filled with threads which cross each other in various directions. Silkworm (q. v.) moths are among the insects most useful to man; but moths in general are regarded by him as injurious, the larvæ of many feeding on leaves of various kinds, and often destroying valuable crops; and the larvæ of some small species proving very destructive to clothes, books, &c. The largest and most splendid moths inhabit tropical countries. Some of the most interesting and important kinds of moth are noticed in separate articles. Notwithstanding a popular dislike of moths, observation of their habits and of the richness of the color of many of them, is a favorite pursuit of naturalists.

**MOTHER CAREY'S CHICKEN**, a name familiarly given by sailors to the Storm Petrel and other small oceanic species of Petrel (q. v.).—The name **MOTHER CAREY'S GOOSE** is, in like manner, given to the Great Black Petrel or Gigantic Fulmar (*Procellariagigantea*) of the Pacific Ocean; a bird of about three feet in entire length, with very long wings, and blackish gray plumage, a ravenous feeder on dead whales and all other animal garbage, and which also kills and preys upon other sea-birds.

**MOTHER OF PEARL**, the shells of the large bivalve mollusc *Meleagrina margaritifera*, which also produces the precious pearls. See PEARL. These shells are collected in vast numbers in the tropical seas, chiefly on the coasts of Ceylon, Manilla, Cuba, Panama, and the South Sea Islands. Those from Panama are small and thick, and are known in commerce as "bullock" shells; those from Manilla are finest in quality, often as much as a foot in diameter, round, and flat. There are two varieties—the white or silver-lipped, and the black-lipped. So enormous is the trade in these shells, that the imports of this country alone amount to 3000 tons per annum, the value of which is nearly £100,000. Although large quantities of these shells are consumed in inlaying fancy wood-work, papier mâché, and in making knife-handles and other small ornamental objects, by far the greater portion is required for making buttons, chiefly in Birmingham.

**MOTHER WATER, MOTHER LYE.** See LYE.

**MOTHERWELL**, William, a Scottish poet and antiquary, was born in Glasgow, 13th October, 1797, and educated chiefly at the grammar-school of Paisley, where, in his fifteenth year, he entered the office of the sheriff-clerk. At the age of twenty-one, he was appointed sheriff-clerk depute of the county of Renfrew. In the following year he published his first work, the "Harp of Renfrewshire," containing biographical notices of the poets of that district, from the 16th to the 19th century. This work was but the prelude to one of far greater importance—his "Minstrelsy, Ancient and Modern," which appeared at Glasgow in 1827. In 1823, he commenced the "Paisley Magazine," in which some of his finest original pieces first saw the light, and in the same year accepted the editorship of the "Paisley Advertiser," a Conservative journal. In 1830, he became editor of the "Glasgow Courier." He died in that city, November 1, 1836, at the early age of 38. M. displays in his best moods (but only then) a rich, beautiful, and strong imagination, great warmth and tenderness of feeling, and a thorough knowledge of the language of a poet. His "Jeannie Morison" is unsurpassed for the mingled pathos and picturesque beauty of its reminiscences of boyish love; "The Sword-Chant of Thorstein Randi" is perhaps the most heroic rime in the English tongue; and the little piece beginning, "My hield is like to rend, Willie," has seldom been read without tears. An enlarged edition of his poetical remains, with a memoir, was published in London in 1849.

**MOTHERWELL**, a town of Scotland, in Lanarkshire, 11 miles from Glasgow.

Motherwort  
Motion

288

its progress, which in late years has been very rapid, is chiefly due to the coal mines in its neighborhood. Pop. (1861) 2925; (1871) 6943.

**MOTHERWORT** (*Leonurus Cardiacæ*), a plant of the natural order *Labiata*, found about hedges and in waste places in Europe, and now abundantly naturalised in some parts of North America. It is not very common in Britain, and probably has been introduced. It is perennial, has a branched stem about three feet high, stalked leaves, the lower ones 3-lobed, and crowded whorls of reddish-white flowers. The calyx has five pungent spreading teeth. The upper lip of the corolla is shaggy on the upper side, the lower lip trifid. The anthers are sprinkled with shining dots. The plant was formerly in much use as a domestic pectoral medicine, but is now comparatively little employed. It has a strong but not agreeable smell.—Other species of the same genus are found in Europe and the north of Asia.

**MOTION**, Laws of, are the fundamental principles connecting force and motion in the physical universe; and are obviously to be derived from *experiment* alone, since intuitive reasoning cannot possibly give us any information as to what may or may not be a law of nature. Though these laws are derived from experiment, it cannot be said that we have any very *direct* experimental proofs of their truth—our most satisfactory verifications of them are derived from the exact accordance of the results of calculation with those of observation in the case of such gigantic combinations of mutually influencing bodies as that of the solar system; and it is by such proofs that they must be considered to have been finally established.

They seem first to have been given systematically and completely by Newton, at the opening of the *Principia*; but the first two were known to Galileo, and some of the many forms of a part of the third were known to Hooke, Huyghens, Wren, and others. We shall give them here in order, with a few brief comments, showing their necessity and their use.

First, then, we naturally inquire, what matter would do if left to itself; and, by considering cases in which less and less external force is applied to a body, we are led to the statement called the *first law of motion*:

1. *Every body continues in its state of rest or of uniform motion in a straight line, except in so far as it may be compelled by impressed forces to change that state.*

This expresses simply the *inertia* of matter—i. e., a body cannot alter its *state* of rest or motion; for any such alteration external force is required. Hence the definition of Force (q. v.), as that which changes or tends to change a body's state of rest or motion.

Now, how does the change of state depend on the force which produces it? This is obviously a new question, to be resolved by experiment; and the answer is the *second law of motion*:

2. *Change of motion is proportional to the impressed force, and takes place in the direction of the straight line in which the force acts.*

Newton's silence is as expressive as his speech. Nothing is here said about the previous motion of the body, or about the number of forces which may be at work simultaneously. Hence, a force produces its full effect in the form of change of motion, whether it act singly or be associated with others; and whatever, moreover, be the original motion of the body to which it is applied. Hence, there is no such thing as *equilibrium of forces*; every force produces motion—and what we call equilibrium is *not* the balancing of forces, but the balancing of their *effects*. Hence, the absurdity of attempting to found the science of Statics on any other basis than is to be derived from the second law of motion; which, in fact, leads us at once (by the *Parallelogram of Velocities*, which is a purely geometrical conception) to the *Parallelogram of Forces*, and thence, with the help of the third law, to the whole subject of Statics. The second law also supplies the means of measuring *force* and *mass*; and of solving any problem whatever concerning the motion of one particle.

But more is required before we can study the motion of a *system* of particles—as a rigid body, or a liquid, for instance; or a system of connected bodies. Here there are mutual actions and reactions of the nature of pressure or of transference of energy (see **FORCE**) between the parts—and these are regulated by the *third law of motion*:

3. *To every action there is always an equal and contrary reaction: or, the mutual actions of any two bodies are always equal and oppositely directed in the same straight line.*

Thus, the mutual pressure between two bodies has equal, but *opposite*, values for the two. The tension of a rope is the same throughout, and tends as much to pull *back* the horse at one end as to pull *forward* the canal-boat at the other. The earth exerts as much attractive force on the sun as the sun exerts on the earth—and the same law applies to the other attractive and repulsive forces, as those of electricity and magnetism.

But Newton goes much further than this; he shews, in fact, that action and reaction (subject to the third law) may consist in *work done by a force*, instead of the mere force or pressure itself. From this form of the third law we derive at once the principle of Virtual Velocities (q. v.), which in its application to machines is familiar as "*What is gained in power is lost in speed.*" But we also derive the grand principle of the indestructibility of work or energy; at all events in the case of the ordinary mechanical forces—and this must be regarded as one of the grandest discoveries which science owes to Newton. It is true that he merely *mentions* it, and then abruptly passes to another subject; yet we can hardly exaggerate the value of this single remark. Experimenters, mainly Davy and Joule, have since shewn that all the physical energies, as heat, light, electricity, &c., are subject in their transformations to the third law of motion, and thus the system constructed by Newton for ordinary dynamical purposes, is now found to rule the most mysterious of the affections of matter. For a development of this, see our article on **FORCE**.

**MOTION, Animal.** Motion or progression is that function by which an animal is able to transport itself from place to place. It is enjoyed exclusively by animals, there being nothing strictly analogous to it in the vegetable kingdom. The organs employed in locomotion are of two kinds, the *passive* and the *active*; the former including all those textures which form the skeleton, and by which its segments are united, as fibrous and areolar tissue, synovial membrane, cartilage, fibro-cartilage, and bone, while the latter includes the muscles with the nerves, which convey to them the mandates of the will.

Before proceeding to notice the different modes of progression of men and animals, it may be expedient to say a few words on *standing*, or the natural attitude of an animal. This attitude depends upon the form and functions of the limbs. Most of the terrestrial mammals and the reptiles (excepting the serpents), both of which use four feet in walking, have the backbone (the vertebral column) nearly horizontal (being only slightly concave downwards), and resting, at the same time, both on the fore and hind legs. Birds, whose anterior extremities are intended for flight, stand upon the posterior limbs only, although in their case, too, the backbone is generally nearly horizontal when the animal is at rest. Man alone stands erect with his head supported on the summit of the nearly vertical vertebral column. Some other animals (monkeys, hares, kangaroos, &c.) can rise more or less erect, but in their case the attitude is obviously not the natural one.

In standing, it is requisite that the limbs should be so arranged that the centre of gravity may fall within the space included by the feet. If the centre of gravity does not fall within this space, the animal cannot stand, but must fall to that side to which the centre of gravity inclines. On this account certain aquatic birds (the albatross, for example), which have their feet placed very far back, cannot use them for walking. If an animal has four legs, it is not necessary that they should have the broad base, which is essential in bipeds. We see that most quadrupeds have comparatively small feet, while birds are furnished with long toes, which, when spread out, form large bases of support. Moreover, the flexor muscles of the toes are so arranged that the weight of the body causes them to contract firmly, and hence birds are enabled to sleep standing without any effort.

**Walking** is the most common form of progression. When it is accomplished by two legs only, as in man, the body is inclined forwards, carrying the centre of gravity in that direction; and while one leg supports the body, the other is thrown forward to prevent it from falling, and to sustain it in turn. Hence, walking has been defined to be a continual falling forwards, interrupted by the projection of the leg. Those writers who have especially studied the theory of walking (Borelli, the brothers Weber, and Bishop) have divided the time of a step into two portions—i. e., that in which one leg only rests on the ground, and that in which both legs rest on the ground. The period in which both feet are on the ground is shorter than that in which the body is supported by one leg only. During the time the body is supported by one leg, the other leg swings from behind forwards, without the active interven-

tion of its muscles, but by the mere force of gravity—in short, like the pendulum of a clock. When this leg is again placed on the ground, the first interval ends, and the other—i. e., that in which the body is supported by both legs—begins, and of course terminates with the raising of the other leg. The time that the body is supported by both legs diminishes as the velocity increases, and vanishes as the walk merges into a run; while, on the other hand, it attains its maximum in extremely slow walking, when it is found by experiment to amount to half the time in which only one leg supports the body. The greatest velocity of walking is attained when the time of a step is equal to half the duration of the motion of the swinging leg, and the velocity in walking of any given person depends on the time taken in making each step, and on the length of the steps; and both of these are, again, dependent on the height at which the centre of gravity of the body or the heads of the thigh-bones are carried above the ground; for as the height of the latter diminishes, the length of the step is increased, while its time is diminished, and *vice versa*. The best walkers are incapable of acquiring a speed of more than seven miles an hour; and even this speed cannot be kept up for any length of time. The walking of quadrupeds is a similar process to that of bipeds, except that the body always rests on at least two legs. The limbs are raised in a determinate order, and usually in such a manner that the hind-leg of one side succeeds the fore-leg of the opposite side.

*Running* consists of the same succession of motions as walking; but these motions are so accelerated, that there is a period between two steps when the body is not supported on either leg; and this constitutes the essential difference between the two paces. It requires a far greater expenditure of muscular force than walking, and cannot be long maintained without considerable exhaustion. First-rate runners can accomplish a mile in a few seconds under four minutes and a half, and ten miles in an hour. (Levett in a match with Frost, which came off on the 23d of March 1852, at Copenhagen Fields, ran 10 miles 250 yards, in 59' 53", and Deerfoot ran 11 miles 740 yards, at Brompton, in an hour). In quadrupeds there are various paces besides walking, which are known as trotting, cantering, and galloping; and as every one is familiar with the ordinary paces of the horse, we shall take that animal as our illustration. In *trotting*, the horse moves its legs in pairs diagonally. Thus, if the left fore and right hind leg be raised, and advanced first, the right fore and left hind leg will be raised the instant the others reach the ground. In fact, in trotting, the first pair are actually raised before the other legs reach the ground, so that there is a minute interval when all four legs are raised above the ground at the same time. The velocity acquired by moving the legs in pairs (as in running), instead of consecutively (as in walking), depends upon the circumstance, that in trotting each leg rests on the ground during a short time and swings during a long time, while in walking the swing occupies a short period, and the rest a comparatively long one. In *cantering*, the animal, after advancing the two fore-legs one after the other, brings forward the two hind-legs simultaneously; and when this movement is greatly urged, the fore-legs are raised together, as well as the hind-legs, and the pace then becomes the *gallop*.

In *leaping*, the horse raises the fore-legs from the ground, and propels the body upwards and forwards by the hind-legs alone. This act in the horse is, however, mainly the result of education, and those animals that leap or spring upon their prey (as the members of the cat tribe) crouch before leaping, in order to throw the body forward with the greatest possible force, by first bending all the limbs, and then suddenly extending them. As the hind-legs are, however, the essential agents in leaping, we observe that in those animals whose natural mode of progression is leaping—as frogs, hares, kangaroos, &c.—the hind-legs are much longer, and more muscular than the fore-legs. Leaping is a common mode of progression in many short-legged birds (blackbirds, thrushes, flukes, sparrows, &c.), in which the step would be extremely short if performed by moving the legs alternately. There is also a large number of insects, such as grasshoppers, fleas, &c., whose ordinary mode of progression is by leaps; and it is in this class of animals that the leaping power is developed to its greatest extent. The common flea, for example, can leap 200 times its own length. While fleas, locusts, and grasshoppers leap by means of their long and strong hind-legs; other insects, as the *Poduridæ*, or spring-tails, possess a forked tail, which they bend beneath the body, and which, when suddenly extended, propels them to a considerable distance.

*Climbing* is merely walking on an inclined or vertical surface. It is usually accomplished by means of sharp nails or claws, as in the cat-tribe, the lizards, &c. In many birds, as the woodpeckers, parrots, &c., the toes are arranged in two divisions, so as to grasp branches in the manner of a hand. Bears and sloths use their arms for climbing, while monkeys use their hands, and in some cases their tails. It is only in a very few cases, as in the sloth, that this is the ordinary method of progression.

The act of *flying* in the bird is accomplished by the simultaneous action of the two anterior limbs, the wings, much as leaping is by that of the two posterior limbs. See **FLYING; BIRDS**. Many attempts have been made to estimate the velocity at which different birds can fly. Whether, as has been stated, the eider-duck can fly 90, and the hawk 150 miles in an hour, is very questionable; but it has been ascertained that carrier-pigeons can accomplish from 38 to 42 miles in that time.

The bats are the only mammals which possess a true power of flight. For a description of their organs and mode of flight, we must refer to the article **BAT**, where will also be found a notice of the false claims of some other mammals, as the so-called flying-squirrel, to the possession of true flight. Similarly, the actions of the flying lizard and of the flying-fish are not true flight. In no class of animals is the mechanism of flight so perfect as in insects. The dragon-fly, for example, can outstrip the swallow; and can do more in the air than any bird, as it can fly backwards and sidelong, to right or left, as well as forwards without turning. The wings of insects, of which there may be either one or two pair, are analogous (as instruments of motion) to the feathered wings of birds, but are regarded as homologous to (or in their essential nature) branchiæ or respiratory organs. For details regarding the mechanism employed in their aerial progression by insects, see **INSECTS**.

*Swimming* is the mode of progression employed by most aquatic animals. It mainly differs from flying in this respect, that water being much more dense than air, and the body of the animal being nearly of the same weight as the water it displaces, very little effort is required to keep the animal from sinking, and hence almost the whole of the muscular force can be employed in progression. In fishes, the locomotive organs consist of the fins and tail, the latter being the great propelling organ. The swimming of a fish has been correctly compared to the motion of a boat propelled by a single oar or scull at the stern. In the same manner as a succession of strokes alternately right and left propels the boat straight forwards, so the fish advances by striking alternately right and left with its tail. The caudal fin, in which the tail ends, is vertical in fishes, and is usually considerably forked, when there is great speed. The ventral fins are for the purpose of keeping the fish in its proper position, with the back upwards, as is shown by a well-known experiment of Borelli, who, after cutting off these fins, restored the living fish to the water, when it rolled from side to side like a drunken man. The air-bladder with which many fishes are provided, and which they can distend and contract at pleasure, facilitates their swimming by enabling them to modify their specific gravity. Most terrestrial mammals, excepting man, swim at once the first time they find themselves in deep water. The reason of this is, that their limbs move in water precisely as they do on land, and no new action either as regards direction or order is required, as is the case with man, to enable them to swim. Those which frequent the water, as seals, otters, and beavers, have webbed feet like ducks and other palmed birds, the toes being united by membranes, which, when expanded, act as paddles. A large number of invertebrate animals move chiefly by swimming. Thus lobsters move by means of a vertical motion of the tail, and many of the crabs by means of their posterior legs, which are fashioned like oars. Many insects swim with their legs, which are fringed with hairs to give additional surface. The cuttle-fish uses its long arms as oars, and darts through the water with extreme rapidity; while other molluscs erect sail-like organs, by which they are propelled along the surface of the water. **SWIMMING**, as a gymnastic exercise, is described in a separate article.

Notices of the more special modes of progression will be found under a variety of heads. See **CRUSTACEA**, **SERPENTS**, **WORMS**.

**MOTION**, in Plants. See **IRRITABILITY** and **SPORE**.

**MOTIVE**, or *Motivo*, in a musical composition, means the principal subject on

which the movement is constructed, and which, during the movement, is constantly appearing in one or other of the parts, either complete or modified. In elaborate and long compositions there are also secondary motives.

**MOTLEY**, John Lothrop, LL.D., D.C.L., &c., American historian, was born at Dorchester, Massachusetts, April 15, 1814. After graduating at Harvard University, he spent a year at Göttingen, another at Berlin, and travelled in Italy and other parts of Southern Europe. Returning to America, he studied law and was admitted to the bar in 1837; but preferring literature, he wrote a historical romance, entitled "Morton's Hope" (1839), which had little success. In 1840, he received the appointment of secretary of legation to the American Embassy to Russia, but soon resigned, and in 1849, published another unsuccessful novel, entitled "Merry Mount, a Romance of the Massachusetts Colony." He attracted attention, however, by some valuable historical essays for American reviews, among which may be mentioned one on De Tocqueville's "Democracy in America," and another on "Peter the Great;" and having planned a history of Holland, he proceeded to Europe for materials, and after five years' labor, published in 1856 "The Rise of the Dutch Republic." In 1860 appeared a continuation of it: "The History of the United Netherlands from the Death of William the Silent to the Synod of Dort." M. was appointed in 1861 United States minister at the court of Vienna, a post from which he was recalled in 1867. In 1869 he was sent as minister to the court of St James, but was recalled the following year. In 1874, he published "The Life and Death of John of Barneveldt, Advocate of Holland; with a View of the Primary Causes and Movements of the Thirty Years' War" (2 vols.). He died 29th May 1877.

**MOTRI'L**, a town of Spain, in the province of Granada, and 35 miles south of the city of that name, in a productive district 3 miles from the sea. Agriculture and fishing are the principal employments of the inhabitants. Pop. 14,000.

**MOTTO**, in Heraldry, a word or short sentence which forms an accompaniment to a coat-of-arms, crest, or household badge. Mottoes were originally attached to the badge when the family had one, or to the crest where there was no badge. In later heraldry, the practice is to place the motto in an escrol either over the crest or below the shield. A motto is sometimes a religious or moral sentiment, as "Gardez la foi," "Humanitate;" it is not unfrequently a heroic exclamation or war-cry, "Courage sans peur," "Forward." In a great many cases it bears reference to the crest, badge, or some bearing of the escutcheon; thus, Stuart, Earl of Moray, has for crest a pelican wounding herself, and for motto, "Salus per Christum Redemptorem;" and not a few mottoes are punning allusions to the family name—as Scudamore, "Scuto amoris Divini;" Vernon, "Ver non semper viret;" "Fare, fac," for Fairfax; and "Time Deum, cole regem," for Coleridge. Two mottoes are sometimes used by the same family—one above the crest, the other below the shield. The motto, "Dieu et mon Droit," which accompanies the royal arms of Great Britain, is supposed to have been a war-cry, and was used in England at least as early as the time of Henry VI. Its origin has been assigned to a saying of Richard I., "Not we, but God and our right have vanquished France."

**MOUFFLON**, or *Musimon* (*Ovis* or *Caprovus Musimon*), the wild-sheep of Corsica, Sardinia, Cyprus, Greece, &c. It is about the size of a small fallow-deer, covered with hair and not with wool, except that hair of a somewhat woolly character appears in winter. The upper parts are brownish, the under parts whitish; the hair of the neck is long; the tail is very short. The horns of the male are very large, approaching to those of the Argali. The M. lives chiefly in the higher parts of mountainous regions, and is not easily approached by the hunter.

**MOULD**, or *Mouldiness*, the common name of many minute fungi which make their appearance, often in crowded multitudes, on animal and vegetable substances, either in a decaying or in a living but morbid state. To the naked eye, they often seem like patches or masses of fine cobweb, and are discovered by the microscope to consist of threads more or less distinctly jointed, sometimes branched. Some species of M. occur on many different substances; others seem to be peculiar to substances of particular kinds, as decaying pears, decaying gourds, &c. Some of the moulds belong to the suborder of fungi called *Phycomyces*. See *FUNGUS*. One of these is the *Common M.* (*Mucor mucedo*), so plentifully found on fruit, paste, pre-

erves, &c., in a state of incipient decay, the progress of which it hastens. It consists of cobweb-like masses of threads, from which rise many short stems, each bearing at the top a roundish membranous blackish spore-case.—A nearly allied, and also very common species, is *Ascothoria mucedo*, which forms a bluish *M.* on bread. From a spreading cobweb-like bed rise long slender branches, terminated by spore-cases, of which the vesicle collapses into the form of a little *picus*.—An interesting species of *M.*, remarkable for its luxuriance and beauty of colors—at first white, then yellow, with orange spore-cases, then shining green or olive, and with threads often several inches long—grows on fatty substances.—Other species of *M.* are ranked among *Hyphomycetes*, a suborder of Fungi, having a floccose thallus and naked spores. One of these is the BLUE *M.* (*Aspergillus glaucus*), which imparts to cheese a flavor so agreeable to epicures, and perhaps marks it as in a condition most suitable for promoting the digestion of other aliments, of which epicures eat too much. Advantage is often taken of the fact, that a small portion of cheese affected with *M.* will speedily infect sound cheese into which it may be introduced. It is one of the few cases in which the propagation of these fungi is ever desired and sought after by man.—SNOW *M.* (*Lanosa nivatis*) is found on grasses, and especially on barley and rye beneath snow, often destroying whole crops. It appears in white patches of a foot or more in diameter, which finally become red as if dusted with red powder.

Even living animals are liable to be injured by fungi of this kind. Silk-worms are killed in great numbers by one called MUSCARDINE (q. v.), or SILK-WORM ROT. Such fungi are sometimes developed on the mucous membrane and in internal cavities of vertebrated animals; and on the bodies of invertebrated animals, as the common house-fly, which, in the end of autumn, when it becomes languid, often dies from this cause. Even strongly-scented substances, if moist, are liable to be attacked by *M.* of one kind or other; nor are strong poisons, either animal or vegetable, a sufficient safeguard. *Ascothoria mucedo* springs up readily in paste full of corrosive sublimate; and the mycelium of moulds is found in strong arsenical solutions. The only sure preventive of *M.* is dryness. Many of the moulds vegetate in liquids, but do not attain their perfect development, only appearing as filamentous and flocculent mycelia. The Vinegar Plant (q. v.) is an instance of this kind.

Mildews and Moulds are very nearly allied.

The rapidity with which these fungi are produced is marvellous. "In favorable circumstances, a plant will pass through every stage of growth to perfect maturation of its seeds in less than two days, the threads which sustain the ripe sporangia being so long, and yet so delicate, as to make it a marvel that they can remain erect."—(Berkeley).

MOULD, the model or pattern from which workmen execute mouldings, ornaments, &c. Also the shape or bed in which metal and other castings are made.

MOULDINGS, the curved and plane surfaces used as ornaments in cornices, panels, arches, &c., and in all enriched apertures in buildings. In classic architecture the mouldings are few in number, and definitely fixed in their forms. There are eight kinds of these regular mouldings, viz., the Cyma, the Ovolo (or Echinus), the Talon, the Cavetto, the Torsus, the Astragal, the Scotia, and the Fillet (q. v.); and each of these mouldings has its proper place assigned to it in each order. See COLUMN. In Gothic architecture, and all other styles, the mouldings are not reduced to a system as in the Greek and Roman styles, but may be used in every variety of form at the pleasure of the artist. Certain forms generally prevail at one period in any style. Thus, in Gothic architecture, the date of a building may in many instances be determined by the form of the mouldings. The Norman mouldings were very simple in outline, and frequently enriched with the zigzag and billet ornaments.

In the early English style, the mouldings are also simple in outline, and are usually arranged in rectangular divisions, and consist of alternate rounds and hollows. In late examples of this style, the fillet was introduced, and led to the more elaborate form of mouldings during the Decorated period.

The mouldings of the perpendicular style are generally flatter and thinner than the preceding, and have large hollows separated by narrow fillets, which produce a meagre effect.

Each of these styles has its peculiar ornaments and style of foliage; and when these are used along with the mouldings, there is no difficulty in determining the approximate date of a building.

**MOULINS**, a town of France, capital of the department of Allier, on the right bank of the river Allier, here crossed by a handsome stone bridge of 13 arches, lies 213 miles, by railway, south-east of Paris, and 95 miles north-west of Lyon. M. was formerly the capital of Bourbonnais. It is a clean, well-built town, with pretty promenades. The principal buildings are the cathedral of Notre Dame (for the enlargement of which the sum of one and a half million francs was granted in 1852), the museum, the theatre, the public library containing 20,000 vols., the new town-house, the Palace of Justice, and the college. Of the old castle, built by the Duc de Bourbon in 1530, only a square tower remains, which is used as a prison. M. carries on trade in coal, wood, iron, grain, wine, oil, and cattle. Pop. (1872) 17,836.

**MOULMEIN**, a town in the province of Tenasserim, British Burmah, situated on the Gulf of Martaban, in the east of the Bay of Bengal, at the junction of the rivers Salween, Gyne, and Attaran, in 16° 29' n. lat., and 97° 38' e. long. M., one of the healthiest stations in India, is a pretty specimen of an eastern town. It is divided into five districts, each of which is under a young or native head of police. The streets are, for the most part, shaded with trees, principally of the acacia tribe, and the glossy jack is often seen half covering a native house, its great fruit, as large as a child's head, ripening in the sun. The principal street, about 3 miles in length, runs due north and south, and parallel with the river Salween. The native houses are constructed in the usual Burman style of bamboo, and a thatch made of the leaf of the water-palm. All are raised on piles, according to the universal custom of the country. Men walk about with the green paper chattrah, or Chinese umbrella, used throughout the provinces; the *gharie*, or India cab, dashes along, the attendant imp revelling in heat and dust.

M. is backed by a fine range of hills, on whose heights flash the gilded spires of innumerable pagodas; and here, too, are built many pretty residences, commanding a fine view of the town, river, and adjacent country, which for picturesque beauty and varied scenery has few equals. M. boasts various churches, chapels, and missionary establishments, several charitable and educational institutions, substantial barracks, a general hospital, public library, &c. Vessels drawing 10 feet of water can come up to M., under charge of pilots from Amherst, and at spring-tide ships of any tonnage may reach the town. The rise and fall of the water is at that time from 20 to 23 feet. The population of M. is steadily, if slowly, on the increase. In 1856, it was 43,633; in 1872, it had reached 46,242. Of these, divided according to their religion, about 27,000 were Buddhists, 11,000 Hindus, 6000 Mussulmans, and 2000 Christians. The mean temperature of M. for the year 1872 was 78°—the highest being 96° in April, and the lowest 61° in January. As to nationality, besides the Burmans proper, the inhabitants of M. include Eurasians or half-castes, Talens, Chinese, Shans, Karens, Armenians, Jews, Malays, and natives of Hindustan.

M. possesses great facilities for ship-building, and many fine vessels have lately been constructed in the building-yards of Tavoyzoo and Mopoon. The principal exports from M. are teak-timber and rice; the imports consist of general merchandise, chiefly piece-goods, hardware, provisions, and sundries.

See "The Tenasserim and Martaban Directory;" Winter's "Six Months in British Burmah" (Lond. 1858); Marshall's "Four Years in Burmah" (Lond. 1860); "Blue-Books."

**MOULTING** is the term applied by naturalists to the periodical exuviation, or throwing off of certain structures, which are for the most part of an epithelial or epidermic character. Thus, in a considerable number of the *Articulata*, the external covering is thrown off, and replaced many times during life. In some of the minute Entomostracous Crustacea of our pools, a process of moulting, similar to that which occurs in crabs and lobsters, occurs every two or three days, even when the animals seem to have attained their full growth. In the crabs, in which the process has been carefully observed, the *exuvium*, or cast-off shell, consists not only of the entire external covering, including even the faceted membrane which forms the anterior coat of the compound eyes, but also carries with it the lining membrane of

the stomach, and the plates to which the muscles are attached. During growth, this moulting takes place as often as the body becomes too large for the shell; and after the animal has attained its full size, it is found to occur at least once a year, at the reproductive season. During the early growth of insects, spiders, centipedes, &c., a similar moult is frequently repeated at short intervals, but after they have attained their full size, no further moulting takes place. In the *Vertebrata* we have examples of as complete a moulting, and replacement of new skin, among frogs and serpents as occur in the *Articulata*, the whole epidermis being thrown off at least once, and, in some instances, several times yearly. In birds, the feathers are periodically cast off and renewed; in mammals generally, the hair is regularly shed at certain periods of the year; and in the deer tribe the casting off and renewal of the antlers must be regarded as a special example of moulting. In man, the continual exuviation of the outer layers of the epidermis is a process analogous to that which takes place on a more general scale in the lower animals.

**MOULTRIE**, Fort, a fortress on Sullivan's Island, at the mouth of Charleston Harbor, South Carolina, celebrated for the repulse of a British squadron commanded by Sir Peter Parker, January 23, 1776. The fort, at that time, was hastily built of Palmetto logs and sand, with 31 guns and 485 men. The spongy wood of the palmetto was found to resist the cannon balls perfectly. The fort was afterwards rebuilt, and in April 1861, took part in the reduction of Fort Sumter, and the commencement of active hostilities in the civil war of secession.

**MOUND** (Lat. *mundus*), in Heraldry, a representation of a globe, surmounted with a cross (generally) pattée. As a device, it is said to have been used by the Emperor Justinian, and to have been intended to represent the ascendancy of Christianity over the world. The royal crown of England is surmounted by a mound, which first appears on the seal of William the Conqueror, though the globe without the cross was used earlier.

**MOUNT**, in Heraldry. When the lower part of the shield is occupied with a representation of ground slightly raised, and covered with grass, this is called a mount in base; e. g., Argent, on a mount in base, a grove of trees ppr.—Walkinshaw of that ilk, Scotland.

**MOUNT VERNON**, the seat and tomb of George Washington, first President of the United States of America, on the right bank of the river Potomac, in Virginia, 15 miles below Washington. The residence of Washington, finely situated on the rising bank of the river, and his tomb, with an estate of 200 acres, have been purchased by a patriotic society of ladies, to be kept as a place of public resort, and a memorial of the "Father of his country."

**MOUNTAIN ASH**. See **ROWAN**.

**MOUNTAIN LIMESTONE**, the basement rock of the carboniferous series in the south of England and in Wales. It consists of a calcareous rock loaded with marine remains, the greater part of the rock being made up bodily of corals, crinoids, and shells. It has a variable thickness, sometimes reaching as much as 900 feet. In the north of England and in Scotland, the marine limestones are not separated from, but alternate with the coal-bearing strata. See **CARBONIFEROUS SYSTEM**.

**MOUNTAINS**. The number and altitude of the mountains of the globe are so great that they form almost everywhere prominent objects, and operate to a large extent in modifying the climatic conditions of every country in the world. Yet the amount of solid material so raised above the ordinary level of the land is not so much as might be expected. Remembering that elevated plateaus of great extent occur in several regions, and that the general surface of the earth is considerably higher than the sea-level, it has been estimated that were the whole dry land reduced to a uniform level, it would form a plain having an elevation of 1800 feet above the sea. And were these solid materials scattered over the whole surface of the globe, so as to fill up the bed of the ocean, the resulting level would be considerably below the present surface of the sea, inasmuch as the mean height of the dry land most probably does not exceed one-fiftieth of the mean depth of the bed of the ocean.

Mountains, and especially mountain-chains, subserve important uses in the econ-

omy of nature, especially in connection with the water system of the world. They are at once the great collectors and distributors of water. In the passage of moisture-charged winds across them, the moisture is precipitated as rain or snow. When mountain-ranges intersect the course of constant winds by thus abstracting the moisture, they produce a moist country on the windward-side, and a comparatively dry and arid one on the leeward. This is exemplified in the Andes, the precipitous western surface of which has a different aspect from the sloping eastern plains; and so also the greater supply of moisture on the southern sides of the Himalayas brings the snow-line 5000 feet lower than on the northern side. Above a certain height the moisture falls as snow, and a range of snow-clad summits would form a more effectual separation between the plains on either side than would the widest ocean, were it not that transverse valleys are of frequent occurrence, which open up a pass, or way of transit, at a level below the snow-line. But even these would not prevent the range being an impassable barrier, if the temperate regions contained as lofty mountains as the tropics. Mountain-ranges, however, decrease in height from the equator to the poles in relation to the snow-line.

The numerous attempts that have been made to generalise on the distribution of mountains on the globe have hitherto been almost unsuccessful. In America, the mountains take a general direction more or less parallel to the meridian, and for a distance of 8280 miles, from Patagonia to the Arctic Ocean, form a vast and precipitous range of lofty mountains, which follow the coast-line in South America, and spread somewhat out in North America, presenting everywhere throughout their course a tendency to separate into two or more parallel ridges, and giving to the whole continent the character of a precipitous and lofty western border, gradually lowering into an immense expanse of eastern lowland. In the Old World, on the other hand, there is no single well-defined continuous chain connected with the coast-line. The principal ranges are grouped together in a Y-shaped form, the general direction of which is at right angles to the New World chain. The centre of the system in the Himalayas is the highest land in the hemisphere. From this, one arm radiates in a northeast direction, and terminates in the high land at Behring Straits; the other two take a westerly course; the one a little to the north, through the Caucasus, Carpathians, and Alps, to the Pyrenees; the other more to the south, through the immense chain of Central African mountains, and terminating at Sierra Leone. Most of the principal secondary ranges have generally a direction more or less at right angles to this great mountain tract.

The inquiry into the origin of mountains is one that has received not a little attention. Geologists have shewn that the principal agents in altering the surface of the globe are denudation, which is always abrading and carrying to a lower level the exposed surfaces, and an internal force which is raising or depressing the existing strata, or bringing unstratified rocks to the surface. Whether the changes are the small and almost imperceptible alterations now taking place, or those recorded in the mighty mountains and deep valleys everywhere existing, denudation and internal force are the great producing causes. These give us two great classes of mountains.

1. *Mountains produced by denudation.*—The extent to which denudation has altered the surface of the globe can scarcely be imagined. All the stratified rocks are produced by its action; but these do not measure its full amount, for many of these beds have been deposited and denuded, not once or twice, but repeatedly, before they reached their present state. Masses of rock more indurated, or better defended from the wasting currents than those around, serve as indices of the extent of denudation. The most remarkable case of this kind, with which we are acquainted, is that of the three insulated mountains in Ross-shire—Sail Vein, Coal Beg, and Conl More—which are about 8000 feet high. The strata of the mountains are horizontal, like the courses of masonry in a pyramid, and their deep red color is in striking contrast with the cold bluish hue of the gneiss which forms the plain, and on whose upturned edges the mountain-beds rest. It seems very probable, as Hugh Miller suggests, that when the formation of which these are relics (at one time considered as old Red Sandstone, but now determined by Sir Roderick Murchison as being older than Silurian), was first raised above the waves, it covered, with an amazing thickness, the whole surface of the Highlands of Scotland, from Ben Lomond to the Maiden Paps of Calthness, but that subsequent denudation swept it all

away, except in circumscribed districts, and in detached localities like these pyramidal hills.

2. *Mountains produced by internal force.*—These are of several kinds. (a.) Mountains of ejection, in which the internal force is confined to a point, so to speak, having the means of exhausting itself through an opening in the surface. The lava, scoriae, and stones ejected at this opening form a conical projection which, at least on the surface, is composed of strata sloping away from the crater. Volcanoes are mostly isolated conical hills, yet they chiefly occur in a somewhat tortuous linear series, on the mainland and islands which enclose the great Pacific Ocean. Vesuvius and the other European volcanoes are unconnected with this immense volcanic tract. (b.) But the internal force may be diffused under a large tract or zone, which, if it obtain no relief from an opening, will be elevated in the mass. When the upheaval occurs to any extent, the strata are subjected to great tension. If they can bear it, a soft rounded mountain-chain is the result; but generally one or more series of cracks are formed, and into them igneous rocks are pushed, which, rising up into mountain-chains, elevate the stratified rocks on their flanks, and perhaps as parallel ridges. Thus, the Andes consist of the stratified rocks of various ages, lying in order on the granite and porphyry of which the mass of the range is composed. The position of the strata on such mountains supplies the means of determining, within definite limits, the period of upheaval. The newest strata that have been elevated on the sides of the mountain when it was formed, give a date antecedent to that at which the elevation took place, while the horizontal strata at the base of the mountain supply one subsequent to that event. Thus, the principal chain of the Alps was raised during the period between the deposition of the Tertiary and that of the older recent deposits. (c.) But there is yet another way in which the upheaving internal force operates, viz., where it does not act at right angles to the surface, but rather obliquely, and, as it were, pushes the solid strata forwards, causing them to rise in huge folds, which, becoming permanent, form parallel ranges of mountains. The crust of the earth, in its present solid and brittle condition, is thus curved, in a greater or less degree, by the shock of every earthquake; it is well known that the trembling of the earth is produced by the progress of a wave of the solid crust; that the destruction of buildings is caused by the undulation; and that the wave has been so evident, that it has been described as producing a sickening feeling on the observer, as if the land were but thin ice heaving over water. This mode of mountain formation has been explained, when treating of the Appalachians (q. v.), which were thus formed. Many other ranges have had a similar origin, as some in Belgium and in the Southern Highlands of Scotland, as has been suggested by Mr Carruthers.

It is evident that in the last two classes the parallel ridges were produced at the same time. Elie de Beaumont generalised this, maintaining that all parallel ridges or fissures are synchronous; and on this he based a system of mountain-structure, which is too universal and too geometrical to be true. The synchronism of parallel fissures had been noticed by Werner, and it is now received as a first principle in mining. The converse is also held to be generally true, that fissures differing in direction differ also in age; yet divergence from a centre, and consequent want of parallelism, as in the case of volcanoes, may be an essential characteristic of contemporaneity. Nevertheless, Elie de Beaumont classified the mountains of the world according to this parallelism, holding that the various groups are synchronous. The parallelism does not consist in having the same relations to the points of the compass—for these, as regards north and south, would be far from parallel—but is estimated in its relation to some imaginary great circle, which being drawn round the globe would divide it into equal hemispheres. Such circles he called Great Circles of Reference. But beyond this, he went a step further, and proposed a more refined classification, depending on a principle of geometrical symmetry, which he believed he had discovered among his great circles of reference. It is to be feared, however, that his geometrical speculations have little foundation in nature.

**MOUNTMELICK**, a market-town and seat of poor-law union, in Queen's County, province of Leinster, Ireland. It is situated on the river Owenass, a branch of the Barrow, 47 miles directly west-south-west from Dublin. The pop. in 1871 was 3315. The town has long been a chief seat of the Society of Friends, who established a manufactory of coarse woollen friezes and tweeds, by which many poor

children are employed. *M.* was also the seat of other manufactures, especially a foundry, a machine-factory, and a beet-root sugar factory, the results of which, however, were disappointing.

**MOURNE MOUNTAINS.** See **DOWN, COUNTY OF.**

**MOURNING**, a particular habit worn to express grief, especially for the decease of friends. The usages regarding mourning have varied much at different times and in different countries. Among the Jews, the duration of mourning for the dead was generally 7, but sometimes protracted to 30 days; and the external indications of sorrow consisted in weeping, tearing the clothes, smiting the breast, cutting off the hair and beard, lying on the ground, walking barefoot, and abstaining from washing and anointing themselves. Among the Greeks, the period was 30 days, except in Sparta, where it was limited to 10. The relatives of the deceased secluded themselves from the public eye, wore a coarse black dress, and in ancient times cut off their hair as a sign of grief. Among the Romans, the color of mourning for both sexes was black or dark blue under the republic. Under the empire, the women wore white, black continuing to be the color for men, who did not cut off the hair or beard as in Greece. Men wore their mourning only a few days; women a year, when for a husband or parent. The time of mourning was often shortened by a victory or other happy public event, the birth of a child, or the occurrence of a family festival. A public calamity, such as a defeat, or the death of an emperor or person of note, occasioned a public mourning, which involved a total cessation of business, called *Justitium*. In modern Europe, the ordinary color for mourning is black; in Turkey, violet; in China, white; in Egypt, yellow; in Ethiopia, brown. It was white in Spain until 1493. Mourning is worn of different depth, and for different periods of time, according to the nearness of relationship of the deceased. On the death of a sovereign or member of the reigning house, a court mourning is ordered; and in this country, it is usual at the same time to recommend the adoption of a general mourning.

In Scotch Law, if a husband die, whether solvent or insolvent, the widow will be entitled to a preferable payment out of the assets for mournings suitable to his rank. And the same privilege applies to mournings for such of the children as are to assist at the funeral. In England, there is no such privilege or distinction.

**MOU'SA**, an island of Shetland, remarkable for an object of antiquity styled *Burgh-Mousa*, which consists of a round tower of the class known in the north of Scotland as Pictish towers. *Burgh-Mousa* occupies a knoll close upon the rocky sea-beach, from which materials for its construction had been taken. The whole fabric is composed of flat slabs of clay-slate, which have been easily piled together in a compact mass without the aid of mortar. In exterior figure, the tower is round, inclining inwards about half-way up, and then bulging out near the top. Near the foundation, its circumference is 153 feet, and it measures about 40 feet in height. On the side next the sea, there is a doorway, and that is the only exterior aperture. If there were ever any door-posts, they have disappeared; it is feebly conjectured, however, that instead of employing a door, the inmates had, on emergencies, built up the opening, for which there is an abundance of loose materials at hand. Entering the doorway, we find the wall sixteen feet thick, and looking upwards, feel as if we were at the bottom of a well, for the circular interior has no flooring, and the top is open to the sky. Opposite the doorway, there is an entrance to a passage and stair, which wind upwards, within the thickness of the wall, to the summit of the building. At different places, there are recesses, or galleries, leading off from the stair, lighted by apertures to the interior; such dismal holes being all that we find in the way of apartments. It is customary to speak of an outer and inner wall; but the two walls, if we so distinguish them, are so firmly bound together by the stair and otherwise, as to afford a united resistance to assault. Obviously, the structure was used as a retreat in case of attack from foreign enemies, against whom missiles could be showered down from the species of battlement formed by the top of the well-knit walls. According to tradition, the tower of *Mousa* was occupied by Erlend, a Norwegian Jarl, about 1154, when it successfully endured a siege that was undertaken to recover a runaway lady; but how any lady could have found accommodation in such miserable quarters, it is difficult to conjecture. The Society of

Scottish Antiquaries deserves thanks for having repaired this fine memorial of a former state of society in Shetland. From its comparatively complete state, Burgh-Moussa is considered a good specimen of the Pictish towers, so called.

**MOUSE** (*Mus*), a genus of rodent mammalia of the family *Muridae* (q. v.), having three simple molar teeth in each jaw, with tuberculated summits, the upper incisors wedge-shaped, the lower compressed and pointed, the fore-feet with four toes and a rudimentary thumb, the hind-feet five-toed; the tail long, nearly destitute of hair, and scaly. This genus includes Rats (q. v.) and mice; the smaller species bearing the latter name.—The Common M. (*M. musculus*) is perhaps not originally British, although now so abundant everywhere. It accompanies man wherever he goes, and readily colonises every region, arctic, temperate, or tropical; its great fecundity, common also to most of its congeners, causing means to be employed everywhere for the prevention of its excessive multiplication. Aristotle made the experiment of placing a pregnant female M. in a closed vessel filled with grain, and found in a short time no fewer than 120 mice in the vessel. Of cats and mouse-traps it seems unnecessary here to speak, and equally unnecessary to give a description of the common mouse. There are several varieties of this species. That generally found in houses is smaller, and not so dark in color, as that common in barns and farmyards. A white variety sometimes occurs, and has been perpetuated in a half-domesticated state. The common brown kind is, however, at least as easily tamed, and readily becomes familiar enough. A pied variety is not uncommon in India.—Much has been written about the singing powers of the M.; it being asserted, on the one hand, that mice not unfrequently shew a strong love for music, and a power of imitating the song of birds; whilst, on the other hand, it is alleged that the singing of mice is merely the consequence of throat disease.—The M. makes a nest like that of a bird in the wainscot of a wall, among the chaff or feathers of a bed, or in any similar situation. The litter is generally from six to ten in number.—The Wood M., or LONG-TAILED FIELD M. (*M. sylvaticus*), is a little larger than the Common Mouse. Its tail is longer; its ears are also longer; its muzzle rather longer; its under-parts lighter in color, than in the common mouse. It is abundant throughout Britain and the temperate parts of Europe, and is a grievous pest in gardens and fields. It lays up stores of grain and other food, either in thick tufts of grass, or just under the surface of the earth. The quantity of food laid up in such stores is often wonderfully large. The Field M. is timid, gentle, and easily tamed.—The smallest British M., and the smallest British quadruped, is the HARVEST M. (*M. messorius*), of which the head and body are only  $2\frac{1}{2}$  inches in length, the tail being almost equally long, and to some degree prehensile; the general form elongated and slender, the head narrow, the ears not large. This species is not uncommon in some parts of the south of England; it is also found in the south of Scotland, although less frequently. It makes its nest among the stalks of wheat, reeds, or other grasses, weaving together the leaves and panicles of grasses, the leaves being for this purpose cut into shreds by its teeth. The nest is a very curious structure formed by mere intertwining, without cement of any kind. It is generally suspended among the stalks. It is globular, or nearly so, and entrance to it is through an opening, which almost completely closes up again.—A still smaller species of M. (*M. pumilus*) is found in the south of Europe.—An American species, the WHITE-FOOTED M. (*M. leucopus*), common in most parts of North America, and intermediate in its habits between the Common M. and the Field M., is said to depart from houses whenever either the cat or the brown rat appears in them.—The Barbary M. (*M. barbarus*) approaches in size to the rats, and is distinguished by its longitudinally striped fur.

The name M. is often popularly given to animals considerably different from the true mice, as the *Voles* (q. v.).

**MOUSE-EAR CHICKWEED** (*Cerastium*), a genus of plants of the natural order *Caryophyllaceae*, having five sepals, five bifid petals, ten stamens, five styles, and a capsule bursting at the top with ten teeth. The species are numerous, natives of temperate and cold countries in all parts of the world. Some of them are among the most common weeds in Britain; others, having larger flowers, are occasionally

Mouth  
Mozambique

300

planted in flower-borders and on rock-works. The form and hairiness of the leaves of some of the British species have given rise to the popular name.

**MOUTH**, Diseases of the, occur in different forms, but usually begin with inflammation of the mucous membrane. The inflammation may be equally diffused, or may be chiefly or entirely confined to the mucous follicles. When diffused, it may either present no peculiar secreted product, or the surface may be covered with a curd-like secretion, or with patches of false membrane. It may further be attended with eruption, ulceration, or gangrene, any one of which may impress a special character on the disease, or it may present peculiarities from the nature of its exciting cause, as when it accompanies scurvy, or is the result of mercurial action.

The following are the principal forms of inflammation of the mouth, or *stomatitis* (Gr. *stoma*, the mouth), as it is termed by nosologists. 1. *Common Diffused Inflammation*, which appears in reddened, somewhat elevated patches, and sometimes occupies large portions of the surface of the mouth. It is more commonly a complication of other diseases than an original affection. When of the latter character, it is generally caused by the direct action of irritants, as by scalding drinks, corrosive substances introduced into the mouth, accumulated tartar on the necks of the teeth, &c. In ordinary cases, cooling and demulcent liquids (such as cream or almond oil) applied locally, an occasional saline cathartic, with a soft and chiefly farinaceous diet, constitute the whole of the necessary treatment.

2. *Diffused Inflammation, with curd-like exudation*, is almost entirely confined to infants, and is described under its popular name of **THRUSH**.

3. *Inflammation of the Follicles, and Eruption or Vesicular Inflammation*, are described in the article **APTHÆ** (q. v.).

4. In *Ulcerative Inflammation, Cancrum Oris, or Canker*, an ulceration, often of considerable size, with a grayish surface and an inflamed edge, appears on the gums, or inside of the cheeks or lips. The swelling of the adjacent parts is often so considerable, as to be apparent externally. There is a copious flow of saliva, and the breath is very offensive. The disease generally occurs in children from two to six years of age. The ulcer may continue for weeks, or even months, but always yields to treatment. The febrile symptoms and the constipation which are usually present, must be combated in the ordinary way. Perhaps the best general method of treating the disease is by the administration of chlorate of potash (four or five grains in sweetened water every four hours), and by frequently washing the mouth with a weak tepid solution of chlorinated soda.

5. The preceding affection is sometimes the first stage of a much more serious affection—viz., *Gangrene of the Mouth*, which usually occurs in children between the first and second dentition. A sloughing ulcer forms upon the gums or some other part of the mouth. This slough spreads, the breath becomes extremely fetid, the disease extends to the alveolar processes, and the teeth are loosened and fall out. Inability to take food is followed by exhausting diarrhoea, and death is the usual termination. Unless taken in the early stage, when tonics and the local application of caustics may be serviceable, the disease is generally fatal.

Other affections of the mouth are noticed in the articles **SALIVATION** and **SCURVY**.

**MOVABLES**, in Scotch law, is the technical term to denote personal as contradistinguished from heritable property, one of the main distinctions of property being between these two classes. Heritage goes to the heir-at-law in case of intestacy, or what is equivalent to it, and movables go to the next of kin. See **KIN**. The term movables is thus not confined to corporeal things, as furniture, cattle, goods, &c., but includes debts, bills of exchange, rights of action, &c.

**MOVILLE**, a small market-town of Ireland, in the county of Donegal, on Lough Foyle, 18 miles n. n. e. of Londonderry. It is a calling-station of the Transatlantic steam-packets of the Anchor and Allan lines. Pop. (1871) 1308.

**MOVING PLANT** (*Desmodium gyrans*), a plant of the natural order *Leguminosæ*, suborder *Papilionaceæ*, a native of India, remarkable, as are also some other species of the same genus, for the spontaneous motion of the leaves. The leaves are ternate, the lateral leaflets much smaller than the terminal one. These lateral leaflets are in constant motion, being elevated by a succession of little jerks till they meet above the terminal leaflet, and then moving downwards by similar rapid jerks to

the leaf-stalk. Sometimes one leaflet is in motion and the other at rest. Sometimes a few may be seen moving, whilst there is a partial cessation in the other leaves of the plant. A high wind causes this cessation more than anything else; the movements are more languid in a very hot dry day, and are to be seen in their perfection in warm moist weather. The terminal leaflet does not remain absolutely at rest, although its movements are not like those of the lateral ones, but oscillates slowly from one side to the other. Concerning these remarkable movements, nothing more than the fact that they take place can yet be said to be known.

MOXA is a peculiar form of counter-irritation which was early practised in the East, particularly by the Chinese and Japanese, from whom it was learned by the Portuguese. One or more small cones, formed of the downy covering of the leaves of *Azadirachta indica* (as used by the Chinese), or of the pith of various plants (as of the common sun-flower), or of linen steeped in nitre, are placed on the skin over the affected part, and the ends remote from the skin are ignited. The combustion gradually proceeds through the cone and forms a superficial eschar on the skin. The surrounding parts must be protected by a pad of wet rag, with a hole in it for the moxa.

It may be employed with advantage in certain forms of neuralgia (especially obstinate sciatica) and paralysis, and in chronic diseases of the joints. It is not much used in consequence of its apparent severity, but the pain is not so great as might be expected, and, according to some of its advocates, is less than often attends blisters.

MOZAMBIQUE, a territory on the east coast of South Africa, nominally belonging to Portugal, and placed under a governor-general, although the actual possessions of Portugal consist only of a few stations, and her authority in the country is inconsiderable. It extends from Cape Delgado, in lat.  $10^{\circ} 41'$  s., to Delagoa Bay,  $26^{\circ}$  s. The chief river, the Zambezi, divides it into two portions—M. proper on the north, and Sofala on the south. Area estimated at 233,500 square miles; pop. 300,000. These figures, however, are only to be considered approximative, as the country has no definite boundary to the west. The coasts, which comprise large tracts of cultivated soil, yielding rich harvests in rice, are fringed with reefs, islands, and shoals, and between Delagoa Bay and Cape Corrientes, and from M., the principal station, to Cape Delgado, the shores are high and steep. The forests yield valuable ornamental woods; ivory is obtained from the hippopotami that haunt the marshes; and gold and copper are found and worked. The elephant, deer, and lion inhabit the jungle; crocodiles are found in the rivers, and numerous flamingoes on the coasts. The rainy season lasts from November to March. The summer heat is very great, and the climate, which is fine in the elevated tracts, is unhealthy on the low shores and the swampy districts. Besides numerous fruits and vegetables, the grains are rice, millet, maize, and wheat. The government is in a most inefficient state, being, in most places, more in the hands of native chiefs than of the Portuguese. In former times the slave-trade was carried on here extensively; and from 1846 to 1857, four governors-general were removed by their government for countenancing, if not actively engaging in it. The colony is divided into six districts, and is ruled by the governor-general and his secretary, assisted by a *junta*. Religion and education are supervised by about twelve Roman Catholic priests, but seem to be at the lowest ebb. Fish and turtle are caught in great quantities on the islands and reefs; pearl-fishing is a source of considerable profit; cattle, sheep, and goats are numerous, and the principal exports are grain, gold-dust, honey, tortoise-shell, cowries, gums, and amber. The Portuguese arrived here in 1497, attracted by rumors of the wealth of the country and the excellence of its ports. The principal settlements are Mozambique, Quillimane, Sena, and Tete.

MOZAMBIQUE, the capital of the Portuguese territory of the same name, is situated on a small coral island, on the eastern coast of Africa, close to the shore, in lat.  $15^{\circ} 3'$  s. It is defended by three forts, is well built, and contains a large square in which the palace of the governor and the custom-house are the chief buildings. Pop. 8500, of whom 7000 are slaves, 270 Christians, 102 Banyans from Hindustan, and 1150 Arabs. In former times all the markets of the world were supplied with slaves from Mozambique. Its commerce, now inconsiderable, is chiefly with India, and is carried on by Arabs.

Mozambique  
Mucilage

302

**MOZAMBIQUE CHANNEL**, between the island of Madagascar and the south-eastern coast of Africa, is about 1000 miles in length, and about 450 in average breadth. At its northern extremity are the Comoro Islands. Over the northern portion the monsoons blow. Black whales, yielding spermaceti, abound.

**MOZARABIAN LITURGY**, a liturgy—traced back by some to the apostles, but by the majority of writers to St Isidore of Sevilla, who redacted it, in co-operation with the Fathers of the 4th Council of Toledo, 633—originally in use among those Christian inhabitants of Spain (Muzarabians, Mostarabians, Mustarabians) who remained faithful to their religion after the Arabic conquest. It is also called the Gothic Liturgy, and differs in some respects from the Roman. Gregory VII. first compelled most of the Spanish churches and convents to adopt the common uniform liturgy of the Romish Church. Six Mozarabic congregations alone, chiefly in Leon and Toledo, were allowed to retain their ancient ritual, but it soon fell into disuse even among these. Archbishop Ximenes of Toledo expressly founded a chapel at Toledo, in 1500, in which mass was to be said according to the Mozarabian manner, lest it might entirely fall into oblivion. He further caused a number of learned priests, Alfonso Ortiz among them, to collate all the different Mozarabian liturgical MSS. to be found in the different churches, chapels, and convents, and finally, there was edited, under his auspices, the "*Missale Mistum secundum Regulam Beati Isidori Dictum Mozarabicum*" (1500—1502), which has, however, by some unfortunate accident, remained incomplete. A whole third of the church-year is left out entirely. The peculiar affinity of this liturgy with the Gallican on the one, and the Greek on the other hand, makes its study extremely important for the history of the ancient Church.

**MOZART**, Johann Chrysostom Wolfgang Gottlieb, one of the greatest of musical composers, was born, 27th January 1756, at Salzburg, where his father was sub-director of the archiepiscopal chapel. His extraordinary musical talents were cultivated to the utmost by his father. At the age of four he played the clavicord, and composed a number of minuets and other pieces still extant. When only six years of age, his performances were so remarkable, that his father took him and his sister, who possessed similar gifts, to Munich and Vienna, where they obtained every kind of encouragement from the elector of Bavaria and the Emperor Francis I. In 1763 and 1764, the Mozart family visited Paris and London. At the age of seven, young Mozart surprised a party of musicians, including his father, by taking part, at sight, in a trio for stringed instruments. Symphonies of his own composition were produced in a public concert in London; and whilst there, he composed and published six sonatas, and made acquaintance with the works of Handel, recently deceased. Two years later, when but twelve years of age, he composed the music for the religious service and for a trumpet concert at the dedication of the Orphan House Church in Vienna, and conducted it in presence of the imperial court. In 1769, at the age of thirteen, he was appointed director of the Prince Archbishop of Salzburg's concerts; and in the same year travelled with his father to Italy, where he created an unheeded enthusiasm by his performances and compositions. He composed the opera of *Mithridates* at Milan, in October 1770, and it was publicly performed there in December of that year. At the age of sixteen, he was the first claricinet in the world; he had produced two requiems and a stabat mater, numerous offertories, hymns, and motets, 4 operas, 2 cantatas, 13 symphonies, 24 pianoforte sonatas, not to speak of a vast number of concertos for different instruments, trios, quartetts, marches, and other minor pieces. In 1779, he was appointed composer to the imperial court at Vienna, where he then fixed his residence, and there the musical works were composed upon which his great fame chiefly depends. His office in Vienna, however, was rather honorary than lucrative, and he lived by concerts, musical tours, teaching of music, and the small profits derived from the sale of his published works, till an offer of a large salary made to him by the king of Prussia led the emperor to give him 800 florins a year. His great opera of "*Idomeneo*" was composed in 1780, with a view to induce the family of Mademoiselle Constance Weber, afterwards his wife, to consent to the marriage, which they had declined on the ground of his reputation not being sufficiently established. This opera forms an epoch not in the composer's life only, but in the history of music. In construction, detail, instrumentation, and every imaginable respect, it was an enormous advance

on all previous works of the kind, and established his repute as the greatest musician whom the world had seen. "Die Entführung aus dem Serail" followed. His six quartetts, dedicated to Haydn, appeared in 1785, and in 1786 "Le nozze di Figaro." In 1791, he produced his "chef-d'œuvre," "Don Giovanni," which, though received with enthusiasm at Prague, was at first beyond the comprehension of the Viennese. "Così fan tutti" appeared in 1790. To 1791, the last year of his short life, we owe "Zauberflöte," "La Clemenza di Tito, and the sublime requiem composed in anticipation of death, and finished only a few days before his decease. He died on 5th December 1791, aged 35.

In the intervals of his greater works, M. composed the majority of the orchestral symphonies, quartetts and quintetts, which are an almost indispensable part of the programme of every concert in the present day, besides masses as familiar in England as in Catholic Europe, innumerable pianoforte concertos and sonatas, and detached vocal compositions, all of the most perfectly finished description. To Haydn M. always acknowledged his obligations; but Haydn's obligations to M. are at least as great. Haydn, though born twenty-four years earlier, survived M. eighteen years, and all his greatest works, written after M.'s death, bear manifold traces of M.'s influence. M. is the first composer in whose works all traces of the old totality disappear; he is the father of the modern school. "No composer has ever combined genius and learning in such perfect proportions; none has ever been able to dignify the lightest and trifest forms by such profound scholarship, or at the moment when he was drawing most largely on the resources of musical science, to appear so natural, so spontaneous, and so thoroughly at his ease."—"Hullah." See Holmes' "Life of Mozart" (Lond. 1945); Otto Jahn's "Life of Mozart" (Leip. 1856).

MOZDO'K, a town and fortress of South Russia, in the government of Caucasus, about 142 m. north of Tiflis. Pop. (1867) 8543, chiefly Armenians.

MOZY'R, a town in the south-east of the government of Minsk, in European Russia, 150 miles south-south-east of Minsk, is situated on the left bank of the Pripet, a tributary of the Dnieper. It is a town of considerable antiquity, and played a rather important part in the wars between the various Russian princes, previous to the Tartar invasion. It was unsuccessfully besieged by the Tartars in 1240. Under the Polish rule it was the chief town of a district, and remained so after its annexation to Russia in 1795. 150 barges and 900 rafts are annually freighted here with goods to the amount of 500,000 rubles. Pop. (1867) 5250.

MSKET, also written Mitsche'tha and otherwise, one of the most ancient Georgian towns, in the present government of Tiflis, and about 10 miles north-north-west of the town of that name. It is said to have been the seat of the Georgian kings down to the 5th c., and contained the first Christian church of Georgia, built during the first half of the 4th century. In this church the Georgian kings were crowned and buried. The site of M. is now marked by a few huts.

MTZENS'K, a town of Russia,, in the government of Orel, 646 miles south-south-east of St Petersburg. It is situated on the Zusha, which communicates through the Oka with the Volga. The old cathedral, built on a steep rock, gives picturesque-ness to the town. M. receives historical mention as far back as 1147. Its trade, chiefly with St Petersburg and Moscow, amounts in value to upwards of 1,000,000 rubles. Pop. (1867) 13,373.

MUCH WOO'LTON (i. e., *Great Woolton*), a town of Lancashire, England, six miles from Liverpool. The town is rapidly increasing in size on account of the proximity of a branch of the North-Western Railway, which runs within two miles. M. W. has long been noted for a stone obtained from a neighboring quarry, which gives employment to a considerable number of men. Pop. (1871) 4643. Near M. W. is the village of Little Woolton, with a pop. of about 1000.

MU'CILAGE, or Bassorin ( $C_{12}H_{10}O_{10}$ ), is a modification of gum which is insoluble in water, but when moistened with it, swells up into a gelatinous mass. It is contained abundantly in gum tragacanth; and many seeds, such as linseed, quince seed, &c., and certain roots, such as those of the marsh mallow, furnish it in large quantity. Alkalies render it soluble in water, and convert it into true gum; and prolonged boiling in water produces the same effect. Nitric acid converts it into mucic and oxalic acids.

**MUCKERS**, the popular name of an extraordinary sect, which sprung up at Königsberg, in Germany, in 1835. The movement seems to have originated in the dualistic and Gnostic views of John Henry Schöuberr (who was born at Memel in 1771, and died at Königsberg in 1826) concerning the origination of the universe by the combination of two spiritual and sensual principles. His followers carried out his system much more completely than himself. The most notable of them were two clergymen, Ebel and Diestel, the former an archdeacon. By their sexual connection would seem to have been elevated into an act of worship, and the chief means of the sanctification of the flesh, by which the paradisiac state was to be restored. Ebel and Diestel founded a society, to which women—some of noble birth—attached themselves. Three ladies lived in Ebel's house, who were popularly regarded as his three wives; and Mr Hepworth Dixon, in his work entitled "*Spiritual Wives*" (1868), tells us that one of them, a young widowed countess, whose beloved husband had fallen on the field of Lützen, and whom he enticed from the seclusion and deep melancholy in which she lived, was described by him as representing to him the principal of Light (*Licht-natur*); another of the ladies represented the principle of Darkness (*Finatniss-natur*); and the third represented the principle of Union (*Umfassung*). The last was his legal wife, but held the most subordinate place in his extraordinary household. Ere long, public feeling was excited against the M., who were said to be guilty, under forms of piety, of the most odious licentiousness in their meetings. The scandal became great in Königsberg, and a garden there acquired the name of the Seraphs' Grove. The subject was brought before the courts (1839—1842), and the result was that Ebel and Diestel were degraded from their offices, and the latter was further punished by imprisonment. It is alleged, however, by some who have examined the whole evidence produced, that the decisions did not proceed upon a calm judicial inquiry, but were dictated by strong prejudice against the accused, on account of their religious views and peculiar eccentricities; and, in particular, that the evidence gives no support whatever to the charge of licentiousness. Mr Hepworth Dixon has directed attention to the similarity of the Mucker movement with that of the Princeites (See **AGAPEMONE**) in England, and that of the Bible Communists or Perfectionists (q. v.) in America, all of which took place about the same time, and in connection with revival excitement, although it may almost be regarded as certain that the originators of these movements had not even heard of each other.

**MUCOUS MEMBRANES AND MUCUS.** Under the term **MUCOUS SYSTEM**, anatomists include the skin, mucous membranes, and true glands, all of which are continuous with one another, and are essentially composed of similar parts. As the skin and the glands are described in special articles, it only remains to speak of the great internal mucous tracts. These are the alimentary mucous membrane, the respiratory mucous membrane, and the genito-urinary mucous membrane.

The *alimentary mucous membrane* commences at the lips, and not only forms the inner coat of the intestinal canal from the mouth to the anus, but gives off prolongations which after lining the ducts of the various glands (the salivary glands, the liver, and the pancreas) whose products are discharged into this canal, penetrate into the innermost recesses of these glands, and constitute their true secreting element. Besides these larger offsets, we find in the stomach and small intestine an infinite series of minute tubular prolongations, the anatomical arrangement and function of which are described in the article **DIGESTION**.

The *respiratory mucous membrane* begins at the nostrils, and under the name of *schneiderian* or *pituitary membrane*, lines the nasal cavities, from whence it sends on either side an upward prolongation through the lacrymal duct to form the *conjunctiva* of the eye; backwards, through the posterior nares (the communication between the nose and the throat), it sends a prolongation through the Eustachian tube to the middle ear (the cavity of the tympanum), and is continuous with the pharyngeal mucous membrane (which is a portion of the alimentary tract); it then, instead of passing down the œsophagus, enters and forms a lining to the larynx, tracheæ, and bronchial tubes to their terminations. From the continuity of these two tracts, some writers describe them as a single one, under the name of the *gastro-pulmonary tract*.

The *genito-urinary mucous membrane* commences at the genito-urinary orifices,

lines the excretory passages from the generative and urinary organs, and is the essential constituent of the glands of both. See KIDNEY, for example.

We thus see that mucous membranes line all those passages by which internal parts communicate with the surface, and by which matters are either admitted into or eliminated from the body. As a general rule, they are soft and velvety, and of a more or less red color, from their great vascularity, but they present certain structural peculiarities according to the functions which they are required to discharge. In all the principal parts of the mucous tracts we find the mucous membrane to present an external layer of Epithelium (q. v.) resting on a thin, transparent, homogeneous membrane, which from its position is termed the *basement membrane*, and beneath this a stratum of vascular tissue of variable thickness, which usually presents either outgrowths in the form of papillæ and villi, or depressions or inversions in the form of follicles, or glands, or both. The follicles are almost invariably present, but the papillæ and villi are limited to the alimentary or gastro-intestinal mucous membrane. "The mucous membranes," says Dr Carpenter, "constitute the medium through which nearly all the material changes are effected that take place between the living organism and the external world. Thus, in the gastro-intestinal mucous membrane we find a provision for reducing the food by means of a solvent fluid poured out from its follicles; whilst the villi, or root-like filaments, which are closely set upon its surface towards its upper part, are specially adapted to absorb the nutrient materials thus reduced to the liquid state. This same membrane, at its lower part, constitutes an outlet through which are cast out not merely the indigestible residuum of the food, but also the excretions from numerous minute glandulæ in the intestinal wall, which result from the decomposition of the tissues, and which must be separated from them to prevent further decay. Again, the bronchio-pulmonary, or respiratory mucous membrane, serves for the introduction of oxygen from the air, and for the exhalation of water and carbonic acid. And, lastly, the mucous membranes are continuous with the cell-lined vesicles or tubes of the various glands, which are the instruments whereby their respective products are eliminated from the blood." Although the various kinds of epithelial cells discharge a special office in relation to the peculiar function of the mucous membrane upon which each kind occurs, yet they all serve one general purpose—namely, that of protecting the surfaces on which they are placed. This protecting power is increased by the presence of the secretion known as *mucus*, which ordinarily forms an extremely thin layer on these membranes, but when they are irritated or inflamed, is secreted in very considerable quantity. The exact mode of its formation is still a disputed question, but it is generally believed to be the product of the gradual solution of the uppermost epithelial cells. Besides acting both mechanically and chemically as a shield to highly sensitive membranes, it has other uses, amongst which two may be especially mentioned—1. It communicates to the salivary, and probably to other glands, properties which are not possessed either by itself or by the pure glandular secretions; and 2. It serves to eliminate a considerable quantity of nitrogen from the system. This nitrogen is contained in the *mucin*, which forms from 2·4 to 9 per cent. of nasal and bronchial mucus. This mucin contains 12·64 per cent. of nitrogen, and is the substance which gives to mucus its viscid and tenacious character. Normal mucus is devoid of smell and taste, and almost, if not quite, neutral; and hence its constant presence in the mouth gives rise to no disagreeable sensation.

MU'DAR (*Calotropis*), a genus of shrubs of the natural order *Asclepiadaceæ*, distinguished by a coronet of fine blunt processes adhering to the base of the filaments. They are natives of the East Indies, and the bark of the root, and the inspissated milky juice of some of them, are much used there as an alterative, purgative, emetic, and sudorific medicine. The medicinal properties of *M.* have been well known in India for many centuries, and have begun to attract the attention of European physicians. It is found of great value in elephantiasis, and in leprosy and other obstinate cutaneous diseases, as well as in some spasmodic affections, and in syphilis.—The species most common in the south of India is *C. gigantea*; in the north, *C. Hamiltonii*; whilst *C. procera*, said to have an extremely acrid juice, extends into Persia, and even into Syria. *M.* is very common in India, springing up in uncultivated ground, and often troublesome in that which is cultivated. It is a large shrub, with stems often thicker than a man's leg; and broad fleshy leaves.

**Mudfish**  
**Muhibansen**

306

It grows where almost nothing else will, on very dry sands, and rapidly attains a large size. The silky down of the pods is used for making a soft, cotton-like thread; but is short, and not easily spun. The inner bark also yields a strong and useful fibre, which makes excellent cordage and fishing-lines; but the mode of preparation hitherto used makes it costly.—The inspissated milky juice of *M.*, collected by making incisions in the bark, is used as a substitute for caoutchouc and gutta-percha. It becomes flexible when heated.—The *M.* of medicine contains a principle called *Mudarine*, on which its medicinal virtues are supposed to depend, and which possesses the rare property of gelatinising when heated, and becoming fluid when again cooled.

**MUD-FISH** (*Amia*), a very curious genus of fishes, forming the family *Amiidae* of the order *Ganoidet* of Müller, although its position among the *Ganoidet* is determined only by anatomical characters, in which it agrees with sturgeons and the rest of that order, for the scales are not ganoid, and are not osseous plates, but are flexible and rounded, and destitute of enamel. Similar scales, however, are found in fossil genera regarded by Agassiz as ganoid. In habit, the *M.* resembles osseous fishes rather than ganoids. Except in the absence of teeth on the tongue, the mouth resembles that of a trout. The body is long and flexible, with a bony vertebral column; there are two nasal cirri; the head is flat, covered with a very thin mucous skin, immediately under which the bones appear as sculptured plates. More than ten species are known, natives of the fresh waters of America. The **WESTERN M.** (*A. calva*) is from a foot and a half to three feet long, bluish-black above, white below. It inhabits the great northern lakes of North America, and is found as far south as Carolina. It feeds chiefly on crawfish and other crustaceans. It is not esteemed as an article of food, although sometimes used by the Indians.

**MU'DKI**, usually spelled **MOODKEE**, a small town of north-west Hindustan, 23 miles south-east of the Sutlej, and 70 miles south-east of the city of Lahore, on the Ravi. It has a pop. of about 6000. Here the first battle in the Sikh war of 1845—1846 was fought (18th December 1845), when the British under Sir Hugh Gough repulsed the Sikhs, and Sir Robert Henry Sale, "Fighting Bob," was killed.

**MUE'DDIN** (*Mu'izzin*), the Arabic name of the Mohammedan official attached to a mosque, whose duty it is to announce the different times of prayer. His chant (*Adan*) consists of these words, repeated at intervals: "Allah is most great. I testify that there is no God but Allah. I testify that Mohammed is the Apostle of Allah. Come to prayer. Come to security." ["Prayer is better than sleep" is added in the morning, at the Subh or Fegh. See **MOHAMMEDANISM**.] "Allah is most great. There is no deity but Allah!" Besides these regular calls, two more are chanted during the night for those pious persons who wish to perform special nightly devotions. The first (*Ula*) continues after the usual *Adan*, in this manner: "There is no deity but Allah! He hath no companion—to Him belongeth the dominion—to Him belongeth praise. He giveth life and causeth death. And He is living and shall never die. In His hand is blessing, and He is almighty," &c. The second of these night calls (*Ebed*) takes place an hour before daybreak, and begins as follows: "I extol the perfection of Allah, the Existing for ever and ever: the perfection of Allah, the Desired, the Existing, the Single, the Supreme," &c. The office of a *M.* is generally intrusted to blind men only, lest they might, from their elevation, have too free a view over the surrounding terraces and harems. The harmonious and sonorous voices of the singers, together with the simplicity and solemnity of the melody, make a strikingly poetical impression upon the mind of the hearer in daytime; much more, however, is this the case whenever the sacred chant resounds from the height of the mosque through the moonlit stillness of an eastern night.

**MU'FTI** (Arabic, *Expounder of the Law*). The Turkish grand Mufti is the supreme head of the Ulemas (servants of religion and laws), and has, together with the Grand Vizir (Vizer Azim), the supreme guidance of the state, nominally ruled by the sultan. His is the chief spiritual authority, and in this capacity he is also denominated Sheikh-ul-Islam (Lord of the Faith). The Imams (priests), however, chosen from the body of the Ulemas, are, from the moment of their official appointment, under the authority of the Kislar-Aga, or Chief of the Black Eunuchs. The better class of the Ulemas are the teachers and expounders of the law, from among whom

the Mollahs and Cadis are elected. The Turkish laws have their basis in the Koran; the Mufti thus, as head of the judges, acquires a spiritual authority. His also is generally the office of girding the sultan with the sword at his ascension to the throne, a ceremony which takes place at the Mosque of Eyub, and which is equal to our ceremony of coronation. The Mufti is elected and may be deposed by the sultan, and his position has in modern days lost much of its former dignity and importance. His Fetwa, or decision, although attached to the imperial decrees, imparts to it but little additional weight. Nor is his own dictum in things spiritual always considered as finally binding. The only prerogative of Muftis and Ulemas which has hitherto remained untouched, is their being exempt from bodily or otherwise degrading punishments; nor can their property ever be confiscated, but descends to their successors.

**MUGGLETONIANS**, a sect that arose in England about the year 1651, and of which the founders were John Reeve, and Ludovic Muggleton (born 1607, died 1697), obscure men, but who claimed to have the spirit of prophecy. Muggleton was a journeyman tailor. He professed to be the "mouth" of Reeve, as Aaron was of Moses. They affirmed themselves to be the *two witnesses* of Rev. xi. They asserted a right to curse all who opposed them, and did not hesitate to declare eternal damnation against their adversaries. They favored the world with a number of publications, one of which—particularly directed to the Parliament and Commonwealth of England, and to His Excellency the Lord General Cromwell—was entitled a "Remonstrance from the Eternal God." The prophets were at that time imprisoned as nuisances "in Old Bridewell." Another publication was a "General Epistle from the Holy Spirit," dated from "Great Trinity Lane, at a Chandler's Shop, overagainst one Mr Millis, a Brown Baker, near Bow Lane End, London." [The first complete edition of M.'s works was published in 1756; another edition appeared in 1832.] The M. denied the doctrine of the Trinity; they held anthropomorphist opinions; and to all this they added many strange doctrines of their own, as that the devil became incarnate in Eve, &c. The M. existed in England as a sect till more than one-fourth of the 19th c. had passed away; but the census of 1851 shewed no trace of them, and they are supposed to be now completely extinct.

**MUHALITCH**, or Mualich, a town of Asia Minor, in Anatolia, 18 miles south of the Sea of Marmora, and 37 miles west of Brusa, picturesquely situated on low hills. It is large and straggling, contains about 1500 houses and three or four khans, and is the seat of a considerable trade, chiefly in exporting silks, wool, and fruits to Constantinople. Pop. 11,000.

• **MUHESUR**, a town of India, in the territory of Indore (q. v.), on the right bank of the Nerbudda, 290 miles north-east of Bombay. The fort contains many houses within its enclosure, but is in bad repair. There is a new palace, built of gray basalt, and overcharged with sculptures of human beings, and of elephants, tigers, and other animals. There are also numerous and costly Hindu temples, erected by Abaya Bai, relict of Kunda Rao, son of Maharajah Mulhar Rao. The river, which is here about 2000 feet wide, has a rapid stream of blue water, rushing over a rocky bottom; the banks are 60 or 80 feet high in the dry season. Access to the water is gained by a ghât, or vast flight of stone stairs, which extends below the water at its lowest level. Pop. about 17,000.

**MÜHLBERG**, a town of Prussian Saxony, situated on the Elbe, 36 miles south-east of Wittenberg. Pop. (1871) 3244. Here, on 24th April 1547, a battle was fought between Johann-Friedrich, Elector of Saxony, and the Emperor Charles V.—a battle fraught with the most important results to the cause of Protestantism in Germany. The battle was soon decided in favor of the emperor, Johann-Friedrich was taken prisoner, and his territories were handed over to Maurice, the representative of the ducal family of Saxony. From this time till 1552, the Catholics were triumphant in Germany.

**MÜHLHAUSEN**, an ancient city of Prussia, in the principality of Eichsfeld, on the Unstrut, 20 miles north-west of Erfurt. It ranked in the middle ages as an important imperial free city, and is still an active centre of commerce. It has manu-

Muhlheim  
Mulder

308

factories for linen and woollen goods, starch, anise, and saffron works, and carpet and leather factories. Pop. (1871) 19,516. M. was deprived of its municipal independence in 1803, and made over to Prussia, with which it has since remained incorporated, excepting for a short period during the predominance of French influence in Germany, when, at the suggestion of Napoleon, it was included in the kingdom of Westphalia, but it was restored to Prussia in 1813.

MÜHLHEIM, the name of two manufacturing towns of Rhenish Prussia, distinguished from each other as *M. an der Rhur*, and *M. am Rhein*. The former, situated on the river Rhur, 16 miles north of Düsseldorf, is a flourishing town, chiefly important on account of its trade in Rhur coal. Excellent river-steamers are built here. Sandstone is extensively quarried, and ironworks and machine-factories are in operation. Cotton-spinning, weaving, printing, tanning, and paper-making are carried on. Pop. (1871) 14,267. *M. am Rhein*, nearly opposite Cologne, carries on extensive manufactures of silk goods (employing 500 looms); there are dye-works and paper and oil mills in operation, and considerable trade and commerce. Pop. (1871) 13,511.

MUIRBURN, in Scotch Law, is the crime of setting fire to heather. Neither owners nor tenants, except in high and wet lands, are entitled to set fire to heather between 11th April and 1st November, though at other times they may. And persons who wilfully fire heather are liable to be fined and imprisoned. In England, maliciously setting fire to heaths is one of the heads of the generic offence of Arson (q. v.).

MUKDEN, or Moukden, in lat. 41° 50' 30" n., long. 123° 37' e., the capital of Shêng-king, the chief province of Manchuria. Its Chinese name is Taungien-foo, signifying *affluent capital*, a translation of the Manchu Moukden, meaning *fourishing*. It lies on a branch of the river Liao, about 500 miles north-east of Peking. The town is surrounded by a wall about 10 miles in circumference, including an inner wall 3 miles in circuit, enclosing the emperor's summer residence. Great pains have been taken by the emperors to enlarge and beautify this the metropolis of the Manchu race, but with only partial success. The family residence and place of sepulture of the founders of the reigning dynasty is Hingking, about 60 miles east of Mukden. It is pleasantly situated in a mountain valley near the palisade which separates the provinces from Kirin. The emperor Kienlung rendered himself celebrated among his subjects, and the city of M. better known abroad, by a poetical eulogy upon the city and province, which was printed in 64 different forms of Chinese writing. In 1681, M. became the seat of government of the Manchu emperors, and is now the seat of several superior tribunals of a Chinese viceroy of the first rank. Nineteen leagues from M. is its port, Niuchwang, or Newchwang (more correctly known as Ying-tz, i. e., "camp" or "military station"), which has been opened recently to foreign commerce. It is shallow, difficult of access, and during many months of the year closed by ice. Pulse, cattle, and drugs are its chief exports. The trade with Great Britain is steadily developing, and forms already about one-third of the whole. According to the consular reports for 1876, the total value of the exports for that year amounted to £395,900 (only £18,300 for foreign ports): the total value of imports was £941,500 (£590,000 from foreign countries). Coal and iron are worked in the province, and are beginning to find a market in Newchwang.

MULATTO. See MIXED RACES.

MULBERRY (*Morus*), a genus of trees of the natural order *Moraceæ*, natives of temperate and warm climates, with deciduous leaves, unisexual flowers in short, thick spikes, a 4-parted perianth, containing either four stamens or one pistil with two styles, the perianth of the female flowers becoming succulent and closing over the small pericarp, the whole spike coalescing into an aggregate fruit.—The COMMON M., or BLACK M. (*M. nigra*), is a native of the middle parts of Asia, but was introduced into the south of Europe more than a thousand years ago, and is now almost naturalised there. It is a low tree, much branched, with thick rough bark, and broad heart-shaped leaves, which are unequally serrated, and very rough. It is cultivated in the middle parts of Europe, and succeeds well in the south of England, but in the northern parts of Britain it requires a wall. The perianth and stigmas are roughly ciliated, and the fruit is of a purplish-black color, with dark red juice,

fine aromatic flavor, and subacid sweet taste. The fruit is much esteemed for dessert; an excellent preserve and a pleasant light wine are made of it. The tree often produces its fruit in prodigious quantity. The wood is employed in cabinet-work, but is not of much value. The leaves are sometimes used for feeding silk-worms. The Black *M.* lives long; trees still existing in England are known to be more than 300 years old. It is propagated by seed, by suckers, by layers, or by cuttings. It succeeds best in a rich light soil.—The WHITE *M.* (*M. alba*) is a native of China, and has been there planted from time immemorial for the sake of its leaves, which are the best food for silk-worms; on which account also it has been cultivated in the south of Europe since about 1540. In North America it does not succeed further north than lat. 43°, being somewhat more impatient of frost than the Black Mulberry. The perianth and stigmas are smooth; the fruit is almost white, and is much less palatable than that of the Black *M.*, although in this respect there is great difference among the many varieties. A rob made of it is useful in sore throat. The best variety for feeding silk-worms, on account of its rapid growth and abundant leaves, is that called the PHILIPPINE MULBERRY. In India, the White *M.* is treated as a bush, and cut down twice a year; the shoots, stripped of their leaves, being thrown away, although the bark has long been used in China and Japan for making paper. It grows readily from cuttings. The root has a considerable reputation as a vermifuge.—The RED *M.* (*M. rubra*), a native of North America, abounding particularly on the lower parts of the Missouri, endures severe frosts much better than either of the preceding, and is therefore preferred for cultivation in some parts of Europe. Its fruit is deep red, and almost as pleasant as the Black Mulberry. The wood is much more valuable; being fine-grained, strong, and adapted even for ship-building. The tree attains a height of 60 feet or more.—The INDIAN *M.* (*M. Indica*) has black fruit of a delicate flavor, and the leaves are extensively used for feeding silk-worms in China, Cochinchina, and Bengal.—*M. atropurpurea* has been introduced into India from China for feeding silk-worms. *M. Mauritiana*, a native of Madagascar and Mauritius; *M. celtidifolia* and *M. corytifolia*, Peruvian species; *M. Tata-rica*, a native of Central Asia; *M. laevigata*, the species most common in the north of India; and *M. Cashmeriana*, a native of Cashmere, produce pleasant fruit. *M. dulcis*, a native of the North of India, is said to be superior in flavor to all others.

The PAPER *M.* (*Broussonetia papyrifera*) differs from the true mulberries in having the female flowers collected in a globular mass. The tree is of moderate size, or, in cultivation, a bush of 6—12 feet high; with leaves either simple or lobed, a native of India, Japan, and the islands of the Pacific Ocean, but now not uncommon in pleasure-grounds in Europe and North America. The islanders of the Pacific cultivate the Paper *M.* with great care. They make a kind of clothing from the bark, using for this purpose the bark of small branches about an inch in diameter, which they macerate in water, and then scraping off the epidermis, press and beat the moist slips together. The paper also, which is used in Japan and many parts of the East, is in great part made from the bark of the young shoots of this plant, which for this purpose is boiled to a pulp, and treated somewhat in the same way as the pulp of rags in Europe. When the shoots are cut, new ones spring up very rapidly.—Silk-worms eat the leaves of the paper mulberry.—The fruit is oblong, of a dark-scarlet color, sweetish, but insipid.

MULDER, Gerard Johanne, a distinguished living chemist, was born in 1802 at Utrecht, where his father was practising as a physician. After obtaining the degree of Doctor of Medicine at the university of his native town in 1826, he commenced the practice of his profession at Amsterdam, where he was appointed to teach botany, and subsequently chemistry, in the newly-established medical school of that city. In 1841, he was elected professor of chemistry at the university of Utrecht, in consequence of the ability he had displayed in various memoirs published in the Dutch scientific journals. He is best known to the general reader as the discoverer of Proteine (q. v.), which he maintains to be the main ingredient of albumen, fibrin, casein, &c.; but the existence of which as an independent chemical compound is at the present day not generally admitted. He is the author of numerous excellent works on physiological and agricultural chemistry, on the chemistry of wine and beer, on diet and nutrition, &c., which, in consequence of their being

**Mule**  
**Muller**

310

written in Dutch, are far less known in this country than they deserve. His "Chemistry of Vegetable and Animal Physiology" has been translated into English by Dr Fromberg, and his "Chemistry of Wine" by Dr Bence Jones.

**MULE** (Lat. *mulus*, supposed to be connected with Gr. *moles*, labor, and with Eng. *moil*), a hybrid animal, the offspring of the male ass and the mare, much used and valued in many parts of the world as a beast of burden. The ears are long; the head, croup, and tail resemble those of the ass rather than those of the horse; but in bulk and stature the M. approaches more nearly to the horse. The M. seems to excel both the ass and the horse in intelligence; it is remarkable for its powers of muscular endurance; and its sure-footedness particularly adapts it to mountainous countries. It has been common from very ancient times in many parts of the east; and is much used also in most of the countries around the Mediterranean Sea, and in the mountainous parts of South America. Great care is bestowed on the breeding of mules in Spain and Italy, and those of particular districts are highly esteemed. In ancient times the sons of kings rode on mules, and they were yoked in chariots. They are still used to draw the carriages of Italian cardinals and other ecclesiastical dignitaries. Both in Spain and in South America, mules employed to carry burdens are driven in troops, each preceded by an animal—in South America, usually an old mare—called the *madrina*, or god-mother, to the neck of which a little bell is attached, and the mules follow with the greatest docility. When troops mingle in their halting-places or elsewhere, they are readily separated, as they recognise at once the sound of their own bell. Mules are comparatively little used in Britain, although it is alleged that work is done at less expense by the employment of mules than by the employment of horses.

As in other hybrid animals generally, males are more numerous among mules than females; in the proportion, it is said, of two or three to one. There is no instance on record of offspring produced by two mules; but instances occur, although rarely, of their producing offspring with the horse and with the ass. The M. is very superior in size, strength, and beauty, to the hinny, the offspring of the male horse and the female ass.

**MULE. See SPINNING.**

**MÜLHAUSEN** (Fr. *Mulhouse*), a town of Germany, in the Imperial territory of Alsace-Lorraine. Pop. (1875) 53,513. M. is built on a small island between the Ill and the Rhone and Rhine Canal, and is an important station on the Strasburg and Basel line of railway. It lies in a fertile, well-watered district, and ranks as one of the most active centres of trade in Alsace; while it is also the seat of a tribunal of commerce, and of various mercantile and trade unions, which have exercised a beneficial influence on the industrial activity of the country. Its numerous manufactures produce superior woollen and fine cambric goods, excellent leather, morocco, and carpets; in addition to which, its printing and dye works for cotton, muslin, wool, and silk fabrics are almost unrivalled in regard to the delicacy of the colors and elegance of the patterns employed. M. has extensive bleaching works, and is noted for its cotton and woollen stocking manufactories, its breweries and distilleries, starch and straw works, and for its ironworks, in which locomotives and various forms of steam-engines are extensively manufactured. These manufactures, together with corn, wine, and brandy, form the staple articles of its very extensive trade.

M. early acquired commercial importance, having been erected into a free imperial city by Rudolph of Hapsburg in 1273. By siding with some of the Swiss cantons in the 14th c., it was enabled to maintain a certain degree of neutrality in the feuds between the empire and France. In 1523, M. adopted the Reformed faith. It remained a part of the circle of the Upper Rhine till 1798, when it was incorporated with France. It became a town of the German Empire after the war of 1870—1871.

**MULL**, after the Isle of Skye, the largest of the Inner Hebrides, belongs to the county of Argyle, and is washed on the w. and s. by the Atlantic, and bounded on the n. e. by the Sound of Mull. It is triangular in shape, hollowed on the west side by an inlet of the Atlantic, and is deeply indented by sea-lochs, of which the principal are Loch-na-Kel and Loch Sreidhan. Area about 237,000 statute acres, of which 12,470 are arable; pop. (1871), exclusive of the neighboring islets, 5947. Its

surface is for the most part occupied by mountains, generally rounded in outline, and rising in Ben More 3155 feet high. Of its fresh-water lakes, Loch Erisa and Loch Ba are the chief. Wood abounds in the north; but owing to the generally tame character of the mountains, the great stretches of moorland, and the absence of well-defined valleys, the scenery, with the exception of that on the coast, is uninteresting. The land under cultivation occurs chiefly on the shores and at the heads of the several lochs. The soil is unusually fertile; but the great humidity of the climate, and the frequency and violence of the gales, render it almost wholly unfit for agriculture. The land is principally laid out in stock-farms, and great numbers of cattle, sheep, and horses are reared and exported. Chief town, Tobermory (pop. 1344), in the north. The harbor of Tobermory is one of the best and safest in the Hebrides. A low-water pier was completed here in March 1854. It enables steamers to land in any state of the tide. The Sound of Mull, 20 miles long, by 2 miles in average breadth, separates the island from the mainland of Argyshire on the north-east.

MÜLLER, Friederich Max (Maximilian), one of the most eminent living orientalisists, was born at Dessau, in the duchy of Anhalt-Dessau, 6th December, 1823. His father, Wilhelm Müller, distinguished not only for his worth as a man, and his extensive and thorough scholarship, but as one of the first German lyric poets, was librarian of the ducal library, but died prematurely, October 1827. M. received the elements of his education at Dessau, and then went to Leipzig, where, under Professor Hermann Brockhaus, he began the study of Sanscrit. This he soon chose as his special pursuit; and the first fruits of his labors appeared in a translation of the "Hitopadesa" (Leip. 1844). In 1844, he went to Berlin to study under Bopp and Schelling, and consult the Sanscrit MSS. to be found there. In Paris, whither he repaired in 1845, he began, at the instigation of Burnouf, to prepare for an edition of the "Rig-Veda," with the commentary of Śāyanācārya. With this view, he came to England, June 1846, to examine the MSS. in the East India House, London, and the Bodleian Library at Oxford; and, on the recommendation of the late Professor H. H. Wilson, the East India Company commissioned him (1847) to edit the "Rig-Veda" at their expense. The first volume of this great undertaking, printed at the Oxford university press, appeared in 1849; and the sixth and concluding volume was published in 1874. In 1850, M. was appointed Deputy Taylorian Professor of Modern Languages at Oxford; in 1854, he succeeded to the professorship; and in 1858, was elected a Fellow of All Souls. While pursuing his labors connected with the "Rig-Veda," M. has published treatises on a variety of philological topics, which have done more to awaken in England a taste for the science of language in its modern sense (see GRAMMAR) than the labors of any other single scholar. Inheriting the poetic imagination and fire of his father, M. has at command such a felicity of illustration, that subjects dry under ordinary treatment, become in his hands attractive. He has published a translation into German of Kālidāsa's "Megha-dūta" (König. 1847); "The Languages of the Seat of War in the East" (2d ed. Lond. 1855); "Comparative Mythology" (in the Oxford Essays for 1856); "History of Ancient Sanscrit Literature" (2d ed. Lond. 1860); Lectures on "The Science of Language," delivered at the Royal Institution, London, in 1861; a second series, delivered in 1863. In 1863, he delivered the Rede Lecture at Cambridge, "On the Stratification of Languages;" and, in 1870, at the Royal Institution, London, a course of lectures "On the Science of Religion." "Chips from a German Workshop," in 4 vols., were published 1868-75. He is one of the 8 foreign members of the Institute of France, and has received the degree of LL.D. from Cambridge and Edinburgh.

MÜLLER, Johann, historian of Switzerland, was born 3d January, 1752, at Schaffhausen, where his father was clergyman and rector of the gymnasium. He studied at Göttingen under Heyne, Schözer, Walch, and others. In 1772 he was appointed professor of Greek at Schaffhausen, and in the same year published his first work, "Bellum Cimbricum" (Zür. 1772). Already he had commenced to devote his leisure hours to the investigation of Swiss chronicles and documents. By the advice of his friend Bonstetten, he went to Geneva in 1774, where he became a private tutor; and also (1778) delivered a series of lectures on "Universal History," afterwards published in 24 volumes. In 1781, he was called to the Collegium Carolinum at Cassel, as professor of statistics, and a little earlier published the first

Müller  
Mullet

312

volume of his great work, "*Geschichte der Schweizer.*" In 1786, he was appointed librarian and councillor of state to the Elector of Mainz; here he finished the 3d volume of his *Swiss History*; his "*Darstellung des Fürstenbundes*" (Leip. 1787); and "*Briefe zweier Domherren*" (Frankfurt, 1797). In 1792, he went to Vienna, where the Emperor Leopold gave him a situation in the privy council, and, in 1800, appointed him first imperial librarian. In 1804, he left Vienna for Berlin, where he wrote "*Ueber die Geschichte Friedrich's I., Ueber den Untergang der Freiheit der Alten Völker,*" "*Versuch über die Zeitrechnungen der Vorwelt,*" and an additional volume of his *Swiss History*. Introduced to Napoleon after the battle of Jena, he was appointed by him (1807), having been previously dismissed from the Prussian service, secretary of state in the new kingdom of Westphalia; but died at Cassel, 29th May, 1809. M.'s "*Sämmtliche Werke*" were published, 27 vols. Stuttgart, 1810-1819; new edit. 40 vols. 1831-1835.

MÜLLER, Johann, one of the most eminent physiologists of the present century, was born at Coblenz on the 14th July 1801. He began to study with a view to orders in the Roman Catholic Church; but in 1819 he abandoned his theological studies, and devoted himself to medicine, taking, in 1822, the degree of Doctor of Medicine at Bonn. Whilst yet a student, he wrote for a prize the treatise "*De Respiratione Fœtus*" (Leip. 1823). He became, in 1824, a tutor; in 1826, an extraordinary, and in 1830, an ordinary professor of physiology and anatomy at Bonn; and in 1833, succeeded Rudolphi as professor of anatomy at Berlin. His physiological researches were most industriously prosecuted, and were rewarded by many discoveries, which obtained for him a high reputation in the scientific world. His works are numerous, and many of them occupied with particular topics in zoology and comparative anatomy. He died of apoplexy at Berlin, April 28, 1858. Among the most important are—"*Zur vergleichenden Physiologie des Gesichtsinns des Menschen und der Thiere*" (Leip. 1826); "*Grundriss der Vorlesungen über die Physiologie*" (Bonn, 1827); "*Grundriss der Vorlesungen über allgemeine Pathologie*" (Bonn, 1829); "*De Glandularum Secernentium Structura Pectentiori earumque prima Formatione in Homine atque Animalibus*" (Leip. 1830); "*Ueber die organischen Nerven der erectilen männlichen Geschlechtsorgane,*" &c. (Berlin, 1835); and "*Handbuch der Physiologie des Menschen*" (2 vols. 4th ed. Coblenz, 1851), "*Manual of the Physiology of Man,*" which has been translated into French and English. He was also the author of a large number of dissertations on a variety of subjects connected with physiology, the most important of which have been separately published. His latest investigations, on infusoria, were published in 1860. The most eminent living physiologists of Germany received their training in his school.

MÜLLER, Julius, a German theologian, was born at Brieg, on April 10, 1801, and was a brother of Charles Otfried Müller (q. v.), the antiquary. He studied at Breslau and Göttingen, at first devoting himself to law, but afterwards to theology. After much mental struggle, he adopted religious views opposed to those of the Rationalists. In 1826, he was appointed pastor at Schönburn and Rosen, near Strehlen, where he remained seven years. Having acquired a high reputation for theological learning, he was appointed in 1831 second university preacher in Göttingen, and there lectured on practical theology and pedagogics. The spirit in which he labored there may be seen from his sermons, entitled "*Das Christliche Leben, seine Kämpfe und seine Vollendung*" (The Christian Life, its Struggles and its Perfection; Bresl. 1834; 3d ed. 1847). In 1834, he became Extraordinary Professor of Theology in Göttingen, and soon after Ordinary Professor in Marburg, from which he went in 1839 to occupy a similar chair in Halle. The work on which his reputation as a theologian chiefly rests is that on Sin, "*Die Christliche Lehre von der Sünde*" (Bresl. 1839; 3d ed., revised and enlarged, 2 vols., 1849), which has been translated into English (2 vols., Edin. 1852-1853). He afterwards published pamphlets on subjects of temporary interest, particularly in vindication of the cause of Evangelical union against the attacks of the rigid Lutherans; and in 1850, he began, in conjunction with Neander and Nitzsch, a periodical, entitled "*Deutsche Zeitschrift für Christliche Wissenschaft und Christliches Leben.*" He also contributed to the "*Theol. Studien und Kritiken.*" His work "*Die Evangelische Union*" appeared in 1854.

MÜLLER, Karl Otfried, one of the most genial, richly erudite, and industrious

classical archaeologists of modern times, was born 28th August 1797, at Brieg, in Silesia. He was the son of a clergyman, and received a careful education. He studied at Breslau and Berlin. His taste for philological and archaeological studies was early developed. The first fruit of his learning was the publication of the "Ægneticonum Liber" (Berl. 1817), after which he soon received an appointment to the "Magdalenum" in Breslau, where his leisure hours were devoted to a grand attempt to analyse the whole circle of Greek myths. In 1819, he obtained an archaeological chair in Göttingen; and to thoroughly prepare himself for it, visited the collections in Germany, France, and England. His great design was to embrace the whole life of ancient Greece, its art, politics, industry, religion, in one warm and vivid conception—in a word, to cover the skeletons of antiquity with flesh, and to make the dry bones live. With this view, he lectured and wrote with a fine earnest animation, until the political troubles in Hanover made his position uncomfortable. He obtained permission to travel, and made tours in Greece and Italy, but unfortunately died of an intermittent fever at Athens, on 1st August 1840. M.'s literary and scholarly activity stretched over the whole field of Greek antiquity. We are indebted to him for many new and striking elucidations of the geography and topography, literature, grammar, mythology, manners and customs of the ancients. His work on the Dorians ("Die Dorier," translated into English by Sir George Cornwall Lewis and Henry Tufnell) forms the 2d and 3d vols. of his "Geschichte Hellen." *Stämme und Staaten* (new and improved ed. 3 vols. Bresl. 1844); his treatise "Ueber die Wohnsitze, Abstammung und ältere Geschichte des Macedon. Volks" (Berl. 1825); his "Etrusker" (2 vols. Bresl. 1828); and his maps of Greece, are works of the highest importance in the departments of ancient history and ethnology. His "Handbuch der Archæologie der Kunst" (Bresl. 1830, 3d ed. 1844; English by Leitch, London, 1850) is full of learning and of acute original observations. His "Prolegomenen zu einer wissenschaftlichen Mythologie" (Gött. 1825) led the way to a strictly historical explanation of the ancient myths. The work by which he is probably best known in England is his "History of the Literature of Ancient Greece" (Lond. 1840), undertaken at the request of the British "Society for the Diffusion of Useful Knowledge." M. died before finishing it; what he had finished was translated into English by Sir George Cornwall Lewis and Dr Donaldson, the latter of whom continued the work from where it left off—at the age of Alexander—down to the taking of Constantinople. The German original was published by M.'s brother (Bresl. 1841). He showed himself also an acute and judicious critic in his editions of Varro, "Lingua Latina," Festus, "De Significatione Verborum," &c. His contributions to periodicals, encyclopædias, &c., were likewise numerous and valuable.—MÜLLER, JULIUS, brother of the preceding, was born at Brieg, 10th April 1801, educated at Breslau, Göttingen, and Berlin, and after holding several offices, finally became a professor of theology at Halle. His best known work, "Die Christliche Lehre von der Sünde" (The Christian Doctrine of Sin; English, Edin. 1856), is considered by theological critics the most acute and profound treatise written in modern times on this mysterious subject.

MULLET (*Mugil*), a genus of acanthopterous fishes, the type of the family *Mugilidae*. In this family, the body is nearly cylindrical, the scales are large; there are two widely separated dorsal fins, the first of which has only four stiff sharp spines; the teeth are extremely fine; the gullet is closed by an extraordinary development of the pharyngeal bones, so that only soft and thin food can pass down it; a branch of the stomach forms a kind of gizzard. The best known of this family belong to the genus *Mugil*, of which there are many species. They have a small mouth, with a fold or creel in the under lip, which fits into a corresponding notch in the upper one. The Common M., or GRAY M. (*M. capito*), is found in the Mediterranean, and along the western shores of Europe, as far as the southern and south-eastern shores of England, but becomes rare further north. The Common M. is usually about fifteen inches in length, but sometimes two feet. The color is steel-gray on the back, with bluish and yellowish reflections; the belly silvery white; the flanks with six or eight longitudinal lines of rosy brown. It often ascends rivers, generally selecting soft or fat substances for food, and often seeking food by thrusting its mouth into the soft mud. It is most readily taken by a bait of the boiled entrails of fish, or cabbage boiled in broth. It is easily reared in ponds, and readily answers the call

**Mullet**  
**Multan**

314

which usually summons it to be fed. It is highly esteemed for the table.—A very nearly allied species, also called GRAY M. (*M. cephalus*), a native of the Mediterranean, is distinguished by having the eyes half covered with an adipose membrane, and by a large triangular scale pointing backwards, just over the origin of each pectoral fin. It attains a larger size than the former species, sometimes ten or twelve pounds weight. It enters the mouths of rivers at certain seasons, and ascends into the fresh water. It is the most esteemed of all the mullets, and was in great request among the ancients. Enormous prices were given by the Romans for unusually large mullets, the price increasing, like that of diamonds, far more rapidly than the size. Mulletts are used fresh, salted, and smoke-dried. A preparation of their roe, called *Botarcha*, is in great esteem as a condiment in Italy and the south of France. Mulletts are often caught in the Mediterranean by angling from a rock, with a bait of paste, when they have been previously attracted to the spot by macaroni thrown into the water.—A third species of GRAY M. (*M. chelo*) is not unfrequent on the coasts of England, and even of Scotland. It is remarkable for its large fleshy lips. It swims in great shoals. In the Mediterranean, it sometimes attains the weight of eight pounds.—The AMERICAN M. (*M. albulus*) is very like the Common M., but more slender, the tail large and forked. It abounds about the Bahama Islands, and extends far northwards. It is highly esteemed for the table.

The name M. is also given to the genus *Mullus* of the family *Percidæ*. See **SUB-MULLET**.

**MULLET**, or **Mollet**, in Heraldry, is a charge in the form of a star, generally with five points, intended to represent a spur-rowel, and of frequent occurrence from the earliest beginnings of coat-armour. Gwillim, Sir George Mackenzie, and Nisbet lay it down that mullets should always be pierced to represent the round hole in which the spur-rowel turns, but this has been by no means uniformly attended to in practice. Much confusion exists in blazonry between mullets and stars; in England, the rule most generally adopted is, that the mullet has five points, whereas the star has six, unless any other number be specified. Nisbet lays down a canon nearly the converse of this, which has never been adhered to; and in Scottish heraldry the same figure seems to be often blazoned as a mullet or a star, according as it accompanies military or celestial figures. The mullet is the mark of cadency assigned to the third son, "to incite him to chivalry." The word mullet is occasionally used in heraldry for the fish so called.

**MULLINGA'R**, chief town of the county of Westmeath, in Ireland, is situated on the great western road from Dublin to Galway, distant from the former, with which it is connected by the Royal Canal and the Midland Western Railway, 50 miles north-west. Its population, in 1871, was 5103, of whom 4090 were Roman Catholics, 886 Protestants of the Episcopal Church, the rest members of other denominations. It is the centre of a poor-law union of 48 divisions, comprising an area of 208,401 acres. M. is a place of little historical interest, although its immunities date from the reign of Elizabeth. Its public buildings are in no way remarkable, but it possesses several schools; among the number, one recently endowed for general educational purposes. It is without manufactures, but has considerable celebrity as the site of several of the most important horse and cattle fairs in Ireland.

**MU'LLION**, the upright division between the lights of windows, screens, &c., in Gothic architecture. Mullions are rarely met with in Norman architecture, but they become more frequent in the Early English style, and in the Decorated and Perpendicular are very common. They have sometimes small shafts attached to them, which carry the tracery of the upper part of the windows. In late domestic architecture they are usually plain.

**MULLIGAN**, Col. James A., was born at Utica, New York, of Irish parents, on June 25, 1830. In 1836 his family removed to Chicago. He studied at the university of St. Mary of the Lake, of which he was the first graduate (1850), and then began to study law. He accompanied J. L. Stephens, the explorer, to the Isthmus of Panama in 1851. When he returned to Chicago, he resumed his studies and became editor of the *Western Tablet*, a weekly Catholic paper. In November, 1855, he was admitted to the bar, and in the winter of 1857 was appointed to a

clerkship in the department of the Interior at Washington, from which he retired at the outbreak of the civil war. He became colonel of the twenty-third Illinois Infantry, a fine regiment of Irishmen which he had raised in a few weeks, and in September, 1861, he left Jefferson City for Lexington, Missouri, where he took the command, and for nine days heroically defended the place against an attack by General Price with overwhelming forces. He was at last forced to capitulate on September 20, and was exchanged on November 25. On his return to Chicago he re-organized his regiment and shortly afterwards assumed the command of camp Douglas. He afterwards took part in several hard-fought engagements in Virginia and was mortally wounded at the battle of Winchester, July 26, 1864.

MULLINS, William, was born in England about the year 1575. In order to enjoy religious freedom which was not granted to the Puritans in England, he settled with his family at Leyden in Holland, and was afterwards one of the richest and most influential of those who came over in the Mayflower. It was expected that he would take an important part in the public affairs of the colony, but he died in the spring of 1621. The only one of his family who lived through that time was his daughter Priscilla, who was celebrated for her beauty and has been immortalized by Longfellow in his poem of *The Courtship of Miles Standish*. Among the many eminent Americans descended from the beautiful Priscilla may be mentioned the poet, Longfellow himself, and also Presidents John and John Quincy Adams.

MULREADY, William, R. A. was born at Ennis, in Ireland, about the year 1786. When a boy, he went to London with his parents; at the age of fifteen entered as a student in the Royal Academy, and made good progress, aiming at first at the classic style, or what, according to the notions of the day, was called high art. Following the bent of his genius, however, he soon relinquished this course, and devoted himself to the study of nature and the works of those artists who attained high reputation in a less pretentious walk of art. His first pictures were landscapes of limited dimension and subject, views in Kensington gravel-pits, old houses at Lambeth, and interior of cottages. He next essayed figure-subjects of incidents in every-day life, such as "A Roadside Inn," "Horses Baiting," "The Barber's Shop," and "Punch" (painted in 1812), "Boys Fishing" (1813), "Idle Boys" (1815). M. was elected an Associate of the Royal Academy in November 1815, and an Academician in February 1816; a strong proof of the high estimation in which his talents were held by his brethren, for the higher dignity is rarely conferred till after a probation of several years as Associate. Even in his earliest time, his works were characterized by much elaboration; but those he executed about the middle period of his career exhibit an extraordinary amount of finish and greater brilliancy of coloring, qualities that he carried further and further as he advanced in years; and though he lived to a great age (he died on July 7, 1863), he continued to work with undiminished powers till within a day of his death. A great number of M.'s best works now belong to the public, as portions of the Vernon and Sheepshanks' collections. In the first-named, there are four pictures, one of these "The Last in, or Traust Boy," exhibited in 1825, being one of the most elaborate works of his middle period; while in the Sheepshanks' collection there are no fewer than 28 of his works, among which, "First Love," exhibited in 1840, is a remarkable example of refinement in drawing, and delicacy of feeling and expression. "The Sonnet," exhibited in 1830, is perhaps his highest effort in point of style; and by "The Butt—Shooting a Cherry," exhibited in 1848, is best exemplified the remarkable minuteness of his finish and richness of his coloring. An edition of the "Vicar of Wakefield," published in 1840, by Van Voorst, embellished with 20 wood-cuts from M.'s drawings, is a very fine work. "Women Bathing" was exhibited in 1849; and, in 1852, "Blackheath Park." "The Toy Seller," a large picture exhibited the year before he died, was unfinished, and not at all equal to earlier and smaller ones, but remarkable as the work of a man whose artistic efforts had been lauded sixty years before.

MULTA'N (or Mooltan), an ancient and important city of India, in the Punjab, on a mound consisting of the ruins of ancient cities that occupied the same site, three miles from the left bank of the Chenab—the inundations of which sometimes reach M.—and 200 miles south-west of Lahore. It has railway communication with all the principal towns of India—Calcutta, Bombay, Madras, Peshawar, &c. The

Mutip'e  
Munchhausen

316

city is surrounded by a dilapidated wall, from 40 to 50 feet in height. The vicinity abounds in mosques, tombs, shrines, &c., attesting alike the antiquity and magnificence of the former cities; and the country around is remarkable for its fertility. M. is a military station, with a small redoubt in the rear of the cantonment. Its bazaars are numerous, extensive, and well stocked; and its shops, 6000 in number, are well supplied with European and Asiatic commodities. Manufactures of silks, cottons, shawls, scarfs, brocades, tissues, &c., are carried on, and there is an extensive banking trade. The merchants of M. are proverbially esteemed extremely rich. Steamers ply between this city and Hyderabad, a distance of 570 miles; and the Indus Valley Railway opens up a commercial outlet from Central Asia, the Punjab, and the North-west Provinces, to the Arabian Sea by Hyderabad and Karachi. In 1849, M. was taken by the British troops under General Whish, and annexed with its territory to the British possessions. The population of M. in 1869 was 56,826.

**MULTIPLE-POINDING** is a well-known form of action in Scotland, by which competing claims to one and the same fund are set at rest. It means double poinding or double distress, suggesting that a person who has funds in his possession is liable to be harassed by double distress; and hence he commences a suit called the action of multiple-poinding, by which he alleges that he ought not to be made to pay the sum more than once; and as he does not know who is really entitled to payment, he cites all the parties claiming it, so that they may fight out their claims among themselves. The suit corresponds to what is known in England as a bill or order of interpleader.

**MULTIPLICATION**, the third and most important of the four principal processes of arithmetic, is a compendious mode of addition, when a number is to be added to itself a given number of times. The three terms of a multiplication are the *multiplicand*, or number to be multiplied; the *multiplier*, or number by which it is to be multiplied; and the *product*, giving the amount which would be obtained if the multiplicand were added to itself the number of times denoted by the multiplier. The symbol of multiplication is  $\times$ ; and in arithmetic, the numbers are placed above each other as in addition, with a line drawn under them; in algebra, the quantities are merely placed side by side, with or without a dot between them—e. g., the multiplication of 3 by 4 may be written  $3 \times 4$ , and of  $a$  by  $b$ ,  $a \times b$ ,  $a.b$ , or  $ab$ . For multiplication of fractions, see **FRACTIONS**.

The operation of multiplication has been much abbreviated by the use of Logarithms (q. v.), and has been rendered a mere mechanical process, by the invention of Napier's Bones, the Sliding Rule, Gunter's Scale, &c.

**MULTIVALVE SHELLS**, or Multivalves, are those shelly coverings of molluscs which are formed of more than two distinct pieces. In systems of Conchology (q. v.), the term is one of primary importance; but since the study of the living animals has led to arrangements very different from those founded on their mere shells, a very subordinate place has been assigned to it, as indicating a distinction, much less important than was at first supposed. Thus, Chitons (q. v.), which have multivalve shells, are now placed in the same order of gasteropods with Limpets (q. v.), of which the shells are univalve; and *Pholas* (q. v.) and *Teredo* (q. v.), which have two principal valves and some small accessory valves, the latter also a long shelly tube, are placed among lamellibranchiate molluscs, along with most of the bivalves of conchologists. In conchological systems, barnacles and acorn-shells were also generally included, and ranked among multivalves; but these are now no longer referred even to the same division of the animal kingdom. See **CIRRHOPODA**.

**MULTURES**, in Scotch Law, mean a quantity of grain either manufactured or in kind deliverable to the proprietor or tacksman of a mill for grinding the corn sent there. Some persons living in the neighborhood are bound to send their corn to be ground at a particular mill, in which case the lands are said to be astricted to the mill, and form the thirl orucken, and the tenants or proprietors of the land are called inucken multurers. Those who are not bound to go to the mill are called out-sucken multurers. Thirlage is thus classed among servitudes, being a kind of burden on the land. Such a right is unknown in England, except sometimes in old manors.

**MUM**, a peculiar kind of beer, formerly used in this country, and still used in Germany, especially in Brunswick, where it may be almost regarded as the national drink. Instead of only malt being used, it is made of malt and wheat, to which some brewers add oats and bean-meal. It is neither so wholesome nor so agreeable as the common ale or beer.

**MUMMY.** See **EMBALMING**.

**MUMMY-WHEAT** is said to be a variety of wheat produced from grains found in an Egyptian mummy. But no good evidence of this origin has been adduced—in fact, it is as good as proved to be impossible; and the same variety has long been in general cultivation in Egypt and neighboring countries. The spike is compound—a distinguishing character, by which it is readily known, but which is not altogether permanent. It is occasionally cultivated in Britain, but seems more suitable to warmer regions.

**MUMPS**, the, is a popular name of a specific inflammation of the salivary glands described by nosologists as *Cynanche Parotidea*, or *Parotitis*. In Scotland, it is frequently termed *The Branks*.

The disorder usually begins with a feeling of stiffness about the jaws, which is followed by pains, heat, and swelling beneath the ear. The swelling begins in the parotid, but the other salivary glands (q. v.) usually soon become implicated, so that the swelling extends along the neck towards the chin, thus giving the patient a deformed and somewhat grotesque appearance. One or both sides may be affected, and, in general, the disease appears first on one side and then on the other. There is seldom much fever. The inflammation is usually at its highest point in three or four days, after which it begins to decline, suppuration of the glands scarcely ever occurring. In most cases no treatment further than antiphlogistic regimen, due attention to the bowels, and protection of the parts from cold, by the application of flannel or cotton-wool, is required, and the patient completely recovers in eight or ten days.

The disease often originates from epidemic or endemic influences, but there can be no doubt that it spreads by contagion; and, like most contagious diseases, it seldom affects the same person twice. It chiefly attacks children and young persons.

A singular circumstance connected with the disease is, that in many cases the subsidence of the swelling is immediately followed by swelling and pain in the *testes* in the male sex, and in the *mammæ* in the female. The inflammation in these glands is seldom very painful or long continued, but occasionally the inflammation is transferred from these organs to the brain, when a comparatively trifling disorder is converted into a most perilous disease.

**MÜNCHHAUSEN**, Karl Friedrich Hieronymus, Baron von, a member of an ancient and noble German family, who attained a remarkable celebrity by false and ridiculously exaggerated tales of his exploits and adventures, so that his name has become proverbial. He was born in 1720, at the family estate of Bodenwerder, in Hanover, served as a cavalry officer in the Russian campaigns against the Turks in 1737–1738, and died in 1797. A collection of his marvellous stories was first published in England under the title of "Baron Münchhausen's Narrative of his Marvellous Travels and Campaigns in Russia" (Lond. 1785). The compiler was one Rudolf Erich Raspe, an expatriated countryman of the baron's. A second edition appeared at Oxford (1786) under the title of "The Singular Travels, Campaigns, Voyages, and Sporting Adventures of Baron Munnikhouseen, commonly pronounced Munchausen; as he relates them over a bottle when surrounded by his friends." Several other editions rapidly followed. In the same year (1786) appeared the first German edition, edited by the poet Bürger; the latest—entitled "Des Freiherrn von Münchhausen, wunderbare Reisen und Abenteuer" (1849 and 1855)—is enriched by an admirable introduction by Adolf Ellisen, on the origin and sources of the famous book, and on the kind of literary fiction to which it belongs. Ellisen's father knew the splendid old braggart in his latter days, and used to visit him. Nevertheless, although Raspe may have derived many of his narratives from M. himself, he appears to have drawn pretty largely from other sources. Several of the adventures ascribed to the baron are to be found in older books, particularly in Bebel's "Faceties" (Strass. 1566); others in Castiglione's "Cortegiano," and Bildermann's "Uto-

Mundane  
Munich

318

pin," which are included in Lange's "*Deliciae Academicæ*" (Hollbronn, 1765). M.'s stories still retain their popularity, especially with the young.

**MUNDANE EGG.** In many heathen cosmogonies, the world (Lat. *mundus*) is represented as evolved from an egg. The production of a young animal from what neither resembles it in form nor in properties, seems to have been regarded as affording a good figure of the production of a well-ordered world out of chaos. Thus, in the Egyptian, Hindu, and Japanese systems, the Creator is represented as producing an egg, from which the world was produced. The same notion is found, in variously modified forms, in the religions of many of the ruder heathen nations. Sometimes a bird is represented as depositing the egg on the primordial waters. There are other modifications of this notion or belief in the classical and other mythologies, according to which the inhabitants of the world, or some of the gods, or the powers of good and evil, are represented as produced from eggs. The egg appears also in some mythological systems as the symbol of reproduction or renovation, as well as of creation. The Mundane Egg belonged to the ancient Phœnician system, and an egg is said to have been an object of worship.

**MUNGO**, St, the popular name of St Kentigern, one of the three great missionaries of the Christian faith in Scotland. St Ninian (q. v.) converted the tribes of the south; St Columba (q. v.) was the apostle of the west and north; St Kentigern restored or established the religion of the Welsh or British people, who held the country between the Clyde on the north, and the furthest boundaries of Cumberland on the south (see *BRETTS AND SOOTS*). He is said to have been the son of a British prince, Owen ab Urien Rheged, and of a British princess, Dwyuwen or Thenaw, the daughter of Llewddyn Lueddog of Dinas Eiddyn, or Edinburgh. He was born about the year 514, it is believed at Culross, on the Forth, the site of a monastery then ruled by St Serf, of whom St Kentigern became the favorite disciple. It is said, indeed, that he was so generally beloved by the monastic brethren, that his baptismal name of Kentigern or Cyudeyrn, signifying "chief lord," was exchanged in common speech for Mungo, signifying "lovable" or "dear friend." Leaving Culross, he planted a monastery at a place then called Cathures, now known as Glasgow, and became the bishop of the kingdom of Cumbria (q. v.). The nation would seem to have been only partially converted, and the accession of a new king drove St Kentigern from the realm. He found refuge among the kindred people of Wales, and there, upon the banks of another Clyde, he founded another monastery and a bishopric, which still bears the name of his disciple, St Asaph. Recalled to Glasgow by a new king, Rydderech or Roderick the Bountiful, Kentigern renewed his missionary labors, in which he was cheered by a visit from St Columba, and dying about the year 601, was buried where the cathedral of Glasgow now stands. His life has been often written. A fragment of a memoir, composed at the desire of Herbert, Bishop of Glasgow, between 1147 and 1164, has been printed by Mr Cosmo Innes in the "*Registrum Episcopatus Glasguensis*." The longer life by Joceline of Furness, written about 1180, was published by Pinkerton in his "*Vitis Antiquæ Sauctorum Scotiæ*." It appeals to two still older lives. The fame of St Kentigern is attested by the many churches which still bear his name, as well in Scotland as in the north of England. The church of Crosthwaite, where Southey is buried, is dedicated to him. The miracles which he was believed to have wrought were so deeply rooted in the popular mind, that some of them sprung up again in the 18th c. to grace the legends of the Cameronian martyrs. Others are still commemorated by the armorial ensigns of the city of Glasgow—a hazel-tree whose frozen branches he kindled into a flame, a tame robin which he restored to life, a hand-bell which he brought from Rome, a salmon which rescued from the depths of the Clyde the lost ring of the frail queen of Cadyow. Nor is it St M. only whose memory survives at Glasgow; the parish church of "St Enoch" commemorates his mother, St Thenaw; and it is not many years since a neighboring spring, which still bears her name, ceased to be an object of occasional pilgrimage.

**MUNI**, a Sanscrit title, denoting a holy sage, and applied to a great number of distinguished personages, supposed to have acquired, by dint of austerities, more or less divine faculties.

**MUNICH**, (Ger. *München*), the capital of Bavaria, is situated in 48° 8' n. lat., and 11° 35' e. long., in the midst of a barren and flat elevated plain, at a height of

about 1700 feet above the level of the sea. Pop. (1871), 169,478, about 90 per cent. being Roman Catholics, 9 per cent. Protestants, and 1 per cent. Jews; (1876) 193,024. M. lies on the left bank of the Isar, and consists, in addition to the old town, of five suburbs, and of the three contiguous districts of Au, Haidhausen, and Obergiesing. By the efforts of King Ludwig I., who spent nearly 7,000,000 thalers on the improvements of the city, M. has been decorated with buildings of almost every style of architecture, and enriched with a larger and more valuable collection of art-treasures than any other city of Germany. It possesses 49 churches, of which all but two or three are Catholic, and of these, the most worthy of note are: the cathedral, which is the see for the archbishopric of Munich-Freising, built between 1468—1494, and remarkable for its two square towers, with their octagonal upper stories, capped by cupolas, and its 30 lofty and highly-decorated windows; the church of the Jesuits, or St Michael's, which contains a monument by Thorwaldsen to Eugene Beauharnais; the Theatiner Kirche, completed in 1767, and containing the burying-vaults of the royal family; the beautiful modern church of St Mariabühl, with its gorgeous painted glass and exquisite wood-carvings; the round church, or Basilica of St Boniface, with its dome resting on 64 monoliths of gray Tyrolean marble, and resplendent with gold, frescoes, and noble works of art; the cruciform-shaped Ludwig Kirche, embellished with Cornelius's fresco of the Last Judgment; and lastly, the Court Chapel of All Saints, a perfect casket of art-treasures. Among the other numerous public buildings, a description of which would fill a volume, we can only briefly refer to a few of the more notable; as the theatre, the largest in Germany, and capable of accommodating 2,400 spectators; the post-office; the Ruhmes-halle; the new palace, including the older royal residence, the treasury and chapel, antiquarian collections, &c.; and the Königsbau, designed by Klenze in imitation of the Pitti Palace, and built at a cost of 1,250,000 thalers, containing J. Schnorr's frescoes of the Nibelungen; the Bauquelling Halle, rich in sculpture by Schwanthaler, and in grand fresco and other paintings. In the still incomplete suburb of Maximilian are situated the old Pinakothek, or picture gallery, erected in 1836 by Klenze, containing 800,000 engravings, 9,000 drawings, a collection of Etruscan remains, &c.; and immediately opposite to it, the new Pinakothek, completed in 1853 and devoted to the works of recent artists; the Glyptothek, with its twelve galleries of ancient sculpture, and its noble collection of the works of the great modern sculptors, as Canova, Thorwaldsen, Schadow, &c. Among the gates of M., the most beautiful are the Siegesthor ("The Gate of Victory") designed after Constantine's triumphal arch in the Forum, and the Isarthor with its elaborate frescoes. In addition to these and many other buildings intended either solely for the adornment of the city, or to serve as depositories for works of art, M. possesses numerous scientific, literary, and benevolent institutions, alike remarkable for the architectural and artistic beauty of their external appearance, and the liberal spirit which characterises their internal organisation. The library, which is enriched by the biblical treasures of numerous suppressed monasteries, contains about 800,000 volumes, of which 1,300 are incunabula, with nearly 23,000 MSS. The university, with which that of Landshut was incorporated in 1826, and now known as the Ludwig-Maximilian University, comprises 6 faculties, with a staff of 116 professors and teachers. In 1876 the number of matriculated students attending the university was 1203. In association with it are numerous medical and other schools, a library containing 200,000 volumes, and various museums and cabinets. M. has an ably-conducted observatory, supplied with first-rate instruments by Fraunhofer and Reichenbach; 8 gymnasia, 4 Latin, 1 normal, various military, professional, polytechnic, and parian schools, of which the majority are Catholic; institutions for the blind, deaf and dumb, and crippled, and for female orphans, besides numerous hospitals, asylums, infant schools, &c.; an academy of sciences; royal academies of painting, sculpture, music, &c.; a botanic garden, parks, public walks, and gardens, adorned with historic, patriotic, and other monuments, and designed for the celebration of annual and other national fairs and festivals; spacious cemeteries, &c. M. is mainly indebted to Ludwig I. for its celebrity as a seat of the fine arts, as the greater number of the buildings for which it is now famed were erected between 1820 and 1860, although, under his successors, Maximilian II., and Ludwig II. (ascended the throne in 1864), the progress of the embellishments of the city has been continued on an equally liberal scale. M. is somewhat behind

many lesser towns of Germany in regard to literary advancement and freedom of speculation, while its industrial activity is also inferior to its state of high artistic development. It has, however, some eminently good iron, bronze, and bell foundries, and is famed for its lithographers and engravers, and its optical, mathematical, and mechanical instrument-makers, amongst whom Utzschneider, Fraunhofer, and Ertl have acquired a world-wide renown. M. is noted for its enormous breweries of *Bavarian beer*; and has some good manufactories for cotton, wool, and damask goods, wax-cloth, leather, paper-hangings, carriages, pianos, gold, silver, and steel wares, &c.

The present name of this city cannot be traced further than the 12th c., when Henry the Lion raised the *Villa Munichen* from its previous obscurity, by establishing a mint within its precincts, and making it the chief emporium for the salt which was obtained from Halle and the neighboring districts. In the 13th c., the dukes of the Wittelsbach dynasty selected M. for their residence, built the Ludwig-burg, some parts of whose original structure still exist, and surrounded the town with walls and other fortified defences. In 1327, the old town was nearly destroyed by fire, and rebuilt by the Emperor Ludwig of Bavaria very much on the plan which it still exhibits; but it was not till the close of last century, when the fortifications were razed to the ground, that the limits of the town were enlarged to any extent. The last fifty years indeed comprise the true history of M., since within that period all its finest buildings have been erected, its character as a focus of artistic activity has been developed, its population has been more than doubled, and its material prosperity augmented in a proportionate degree.

**MUNICIPAL ARCHITECTURE**, the style of the buildings used for municipal purposes, such as town-halls, guild-halls, &c. These were first used when the towns of the middle ages rose in importance, and asserted their freedom. Those of North Italy and Belgium were the first to move, and consequently we find in these countries the earliest and most important specimens of municipal architecture during the middle ages. It is only in the "free cities" of that epoch that town-halls are found. We therefore look for them in vain in France or England till the development of industry and knowledge had made the citizens of the large towns so wealthy and important as to enable them to raise the municipal power into an institution. When this became the case in the 15th and 16th centuries, we find in these countries abundant instances of buildings erected for the use of the guilds and corporations and the municipal courts. Many of these still exist along with the corporate bodies they belong to, especially in London, where the halls are frequently of great magnificence. Many of these corporation halls have recently been rebuilt by the wealthy bodies they belong to, such as the Fishmongers, Merchant Taylors, Grocers, and other companies. Municipal buildings on a large scale for the use of the town councils and magistrates have also been recently erected in many of our large towns, which had quite outgrown their original modest buildings; and now no town of importance is complete without a great town-hall for the use of the inhabitants.

Municipal buildings always partake of the character of the architecture of the period when they are erected; thus, we find in Italy that they are of the Italian-Gothic style in Como, Padua, Vicenza, Venice, Florence, &c., during the 13th, 14th, and 15th centuries. In Belgium, during the same period, they are of the northern Gothic style, and are almost the only really fine specimens of the civil architecture of the middle ages we possess. The Cloth-hall at Ypres, and the town-halls of Brussels, Louvain, Bruges, Oudenarde, &c., the Exchange at Antwerp, and many other markets, lodges, halls, &c., testify to the early importance of the municipal institutions in Belgium.

It is a curious fact, that in France, where the towns became of considerable importance during the middle ages, so few municipal buildings remain. This arises from the circumstance, that the resources of the early municipalities of France were devoted to aid the bishops in the erection of the great French cathedrals, and the townspeople used these cathedrals as their halls of assembly, and even for such purposes as masques and amusements.

Of the English corporation halls, those which remain are nearly all subsequent to the 14th c., from which time to the present there are very many examples. The Guild-hall of London is one of the earliest. The present building was begun in 1411,

and was built chiefly by contributions from the trades "companies" of London. Of the town-halls recently erected, those of Manchester, Liverpool, and Leeds are amongst the most important.

**MUNICIPALITY**, Municipal Corporation (from Lat. *municipes*, from *munus* and *capio*, one who enjoys the rights of a free citizen), a town or city possessed of certain privileges of local self-government; the governing body in such a town. Municipal institutions originated in the times of the Roman empire. The provincial towns of Italy, which were from the first Roman colonies, as also those which, after having an independent existence, became members of the Roman state, though subjected to the rule of an imperial governor, were allowed to enjoy a right of regulating their internal affairs. A class of the inhabitants called the *curia*, or *decuriones*, elected two officers, called *duumviri*, whose functions were supposed to be analogous to those of the consuls of the imperial city, and who exercised a limited jurisdiction, civil and criminal. There was an important functionary in every municipality called the *defensor civitatis*, or advocate for the city, the protector of the citizens against arbitrary acts on the part of the imperial governor. In the later ages of the empire, the Decurions were subject to heavy burdens, not compensated by the honor of the position, which led many to endeavor to shun the office. The municipal system declined with the decline of the empire, yet it retained vitality enough to be afterwards resuscitated in union with feudalism, and with the Saxon institutions of Britain. Some cities of Italy, France, and Germany have indeed derived their present magistracy by direct succession from the days of imperial Rome, as is notably the case with Cologne. The bishop being a shield between the conquerors and the conquered, in many cases discharged the duties or obtained the functions of the *defensor civitatis*. To the north of the Alps, under the feudal system, he became officially the civil governor of the city, as the count was of the rural district. In Southern Europe, where feudalism was less vigorous, the municipalities retained a large share of freedom and self-government.

Of the cities of the middle ages, some were entirely free; they had, like the provincial towns of Italy before the extension of the Roman conquests, a constitution independent of any other powers. Venice, Genoa, Florence, Hamburg, and Lübeck, all stood in this position. Next in dignity were the free imperial cities in Germany, which, not being comprehended in the dominions of any of the princes, were in immediate dependence on the empire. Most of these cities rose into importance in the 13th c.; and their liberties and privileges were fostered by the Franco-German emperors, to afford some counterpoise to the growing power of the immediate nobility. Nürnberg was especially celebrated for its stout resistance to the House of Brandenburg, and the successful war which it waged with the Franconian nobility. In England, the more important cities were immediate vassals of the crown; the smaller municipalities sometimes owned a subject superior, sometimes a greater municipality for their overlord.

Under the Anglo-Saxons, the English burghs were subject to the rule of an elective officer, called the "Portreeve," who exercised in burgh functions similar to those of the shire-reeve in the shire. The Norman conquerors recognized the already existing privileges of the towns by granting them charters. Instead of a shire-reeve, a viscount was placed by the king over each shire, and a bailiff instead of the former elective officer over each burgh. In the larger towns, the bailiff was allowed to assume the Norman appellation of Mayor. The municipal franchise seems to have been vested in all the resident and trading inhabitants, who shared in the payment of the local taxes, and performance of local duties. Titles to freedom were also recognised on the grounds of birth, apprenticeship, marriage, and sometimes free gift.

In all the larger towns, the trading population came to be divided into guilds or trading companies, through membership of which companies admission was obtained to the franchise. Eventually the whole community was enrolled in one or other of the guilds, each of which had its property, its by-laws, and its common hall, and the community elected the chief officers. It was on the wealthier and more influential inhabitants that municipal offices were generally conferred; and the practice gradually gained ground of these functionaries perpetuating their authority without appealing to the popular suffrage. Contentions and disputes arose regarding the right of election, and eventually the crown threw the weight of its influence into the

scale of self-elective ruling bodies. As the greater municipalities grew in strength, we find their right recognised to appear in parliament by means of representatives. The sheriffs were considered to have a discretionary power to determine which towns should, and which should not have this privilege of representation. The sovereigns of the House of Tudor and Stuart acquired the habit of extending the right of parliamentary representation to burghs not in the enjoyment of it, while at the same time, by granting or renewing to them municipal charters, they modelled the constitution of these burghs to a self-elective type, and restricted the right of voting in the choice of a representative to the governing body. During the reign of William III., Anne, and the earlier Georges, the influence of the crown was largely employed in calling new municipal corporations into existence, with the view of creating additional parliamentary support for the ministry in power. The burghs of Scotland had a history much like that of the burghs of England; their earlier charters were mere recognitions of already existing rights, and were granted to the inhabitants at large. In the course of the 14th and 15th centuries, the municipal suffrage fell gradually more and more into the hands of restricted bodies of men, until act 1469, c. 5, gave to the councils the right of appointing their successors, the old and new council together electing the officer-bearers of the corporation. This state of things continued till 1833, not without much complaint. In the Scottish burghs, the several trades possessed a much more exclusive monopoly than in England. Along with the outcry for parliamentary reform arose an outcry for municipal reform; and a separate municipal reform act putting an end to the close system was passed for each part of the empire. The English act (5 and 6 Will. IV. c. 76), entitled "An act to provide for the regulation of Municipal Corporations in England," conferred the franchise on the owners and occupiers of property within burgh, with certain qualifications as to property, residence, &c. This constituency elected the councillors, and from the body of the councillors, the mayor and aldermen were chosen. Act 32 and 33 Vict. c. 55, limited the requisite period of residence to one year's occupation, and the ballot was introduced by 35 and 36 Vict. c. 83, in municipal as in parliamentary elections. Act 3 and 4 Will. IV. made an entire change in the mode of electing councils in Scottish burghs which already had a council, and conferred councils on burghs which had none. A vote was given to every one who had resided six months in the burgh, or within seven miles of it, and possessed the requisite qualification to exercise the parliamentary franchise; a property qualification similar to what conferred the parliamentary franchise being required in burghs that did not send or contribute to send a member to parliament. The Municipal Elections Amendment Act (Scotland) 1868, has placed the municipal franchise in the hands of all registered voters to return a member of parliament, and in the case of boroughs not represented in parliament, in the hands of all persons possessing similar property qualifications: and act 33 and 34 Vict. c. 93 has provided for the establishment of a municipal register in burghs not represented in parliament. An exemption, under 3 and 4 Will. IV. c. 76, of nine small burghs from the operation of the new system has been done away with. Town-councillors must be electors residing in or carrying on business in the burgh. They remain in office three years, and elect from their own number the provost and bailies. The English act of Will. IV. abolished the exclusive privileges of the guilds, but these monopolies continued in Scotland till 1839, when they were swept away by 9 and 10 Vict. c. 17. The Irish municipal system, which had been imported ready-made from England, was assimilated to the altered English system by 3 and 4 Vict. c. 108.

**MUNIMENT-HOUSE**, a strong fire-proof apartment or building suited to contain archives, papers, and other valuables.

**MUNJEET** (*Rubia cordifolia* or *munjistia*), a species of Madder (q. v.), of which the root yields an excellent red dye. The plant differs from the common madder in its more distinctly quadrangular stem, its cordate-oblong leaves commonly in fours, and its red berries. It is a native of India, China, Japan, Central Asia, and Siberia. The root has long been used in India as affording a red dye; and is now an article of export to Europe, as a substitute for madder.

**MUNKA'CS**, a market-town of Hungary, situated on an affluent of the Theiss, 178 miles north-east of Pesth. The inhabitants are mostly artisans, and the chief production is hosiery. There are also alum manufactories, saltpetre-works, and in

the vicinity, iron-works, and mines of rock-crystal, called Hungarian diamonds. A short distance east from the town is the fortress (founded in 1359) of M., built upon an isolated height, which, although small and insignificant-looking, yet, from its strong walls and advantageous position, has, for the last few centuries, withstood many a siege. Since the beginning of the present century, it has been used as a state-prison. Pop. (1869) 8692.

MUNSTER, the largest of the four provinces of Ireland, occupies the south-west, and is bounded on the n. by Connaught, on the e. by Leinster, and on the w. and s. by the Atlantic. It contains the six counties of Clare, Cork, Kerry, Limerick, Tipperary, and Waterford, and the country is described under these heads. Area, 6,064,579 statute acres. The population of the province, which in 1841 was higher than that of any of the other provinces, was shewn to be, in 1871, 1,398,488, or 439,748 less than that of Ulster, now the most populous of the provinces.

MUNSTER, chief town of the district of the same name, as well as capital of all Westphalia, is situated in 51° 55' n. lat., and 7° 40' e. long., at the confluence of the Aa with the Münster Canal, 65 miles north-east of Düsseldorf. The population in 1871 was 34,815; in 1876, 35,535. M., which is a bishopric, and the seat of a military council, a high court of appeal, and other governmental tribunals, is one of the handsomest towns of Westphalia, retaining numerous remains of medieval architecture, whose quaint picturesque quality is enhanced by the numerous trees and shady allees, by which the squares and streets are ornamented. Among its 14 churches, of which the majority are Catholic, the most noteworthy are the cathedral, built between the 13th and 15th centuries, and despoiled of all its internal decorations by the Anabaptists; Our Lady's Church, with its noble tower; the splendid Gothic church of St Lambert, in the market-place, finished in the 13th c., on the tower of which may still be seen the three iron cages in which the bodies of the Anabaptist leaders, John of Leyden, Knipperdolling, and Krechting, were suspended, after they had suffered the most horrible martyrdom; and the church dedicated to St Ludgerus, the first bishop of M., with its singular round tower, surmounted by an octagonal lantern. The Gothic town-hall possesses historical interest in being the spot at which, in 1648, the Peace of Westphalia was signed in a large hall, which has lately been restored, and which contains portraits of all the ambassadors who were parties to the treaty. The palace, built in 1767, is surrounded by fine pleasure-grounds, including horticultural and botanical gardens, connected with the academy; and these, with the ramparts, which, since the Seven Years' War, have been converted into public walks, form a great attraction to the city. M. is well provided with institutions of charity and benevolence. The old Catholic university of M. was dismembered in 1818, and its funds apportioned to other educational establishments; and the present academy, which comprises a Catholic theological and philosophical faculty, is now the principal school. It has a library of 50,000 volumes, a natural history museum, and various collections of art and antiquity connected with it. M. has one gymnasium, a normal school for female teachers, and a number of town schools. The industrial products of M. include leather, woollen fabrics, thread, starch, and sugar, besides which there are good carriage manufactories, breweries, and distilleries. The trade is limited to the produce of the country, the principal of which are the noted Westphalian ham and sausages.

M. was known under the name of Minigardevorde in the time of Charlemagne, who, in 791, appointed it as the see of the new bishop of the Saxons, St Ludgerus. Towards the middle of the 11th c., a monastery was founded on the spot, which in course of time derived its present name from its vicinity to the minster, or monastery. In the 12th c., the bishopric was elevated into a principality of the empire. In the 13th c., the city was incorporated in the Hanseatic League; and in 1538, it declared its adhesion to the Reformed faith, notwithstanding the violent opposition of the chapter. During the years 1535 and 1536, M. was the scene of the violent politico-religious movement of the Anabaptists, when the excesses of these pretended reformers worked a violent reaction in the minds of the people, which had the effect of restoring the prestige of the episcopal power; and although the citizens occasionally made good their attempted acts of opposition to their spiritual rulers, they were finally reduced to submission under Bishop Christopher Bernhard of St Gall, who having, in 1668, built a strong citadel within the city, transferred the epis-

Muntjak  
Murat

324

copal place of residence thither from Koesfeld, where it had been established by earlier bishops. In the Seven Years' War, M. was repeatedly besieged and taken by both the belligerent parties. The bishopric of M., which since 1719 had been merged in the archbishopric of Cologne, although it retained a special form of government, was secularised in 1803, and divided among various royal houses; but subsequently shared in the common fate of other German provinces, and was for a time incorporated with France. The Congress of Vienna gave the greater part of the principality to Prussia, a small portion being apportioned to the House of Oldenburg. The Hanover acquired possession of the Münster territories of the mediatised Dukes of Arenberg.

**MUNTJAK** (*Cervus muntjac*, *Cervulus vaginalis*, or *Styllocerus muntjac*), a species of deer, abundant in Java, Sumatra, and other islands of the same region. It is about one-fifth larger than the roebuck, which it considerably resembles in form. The horns are remarkable, as there springs from the common base of each an additional horn, which is about an inch and a half in length; the principal horn, which is simple, curved, and pointed, being about five inches in length. The female has no horns. The male has large canine teeth or tusks, which also are wanting in the female.—Allied species are found in India and China.

**MÜNZER**, Thomas, one of the leaders of the Anabaptists (q. v.), was born at Stolberg, in the Harz, took his degree at Wittenberg as Master of Arts, and for some time preached the doctrines of the Reformation in Zwickau and other places. Ere long, however, he adopted mystic views, and declaimed against what he called the "servile, literal, and half" measures of the reformers, requiring a radical reformation both in church and state according to his "inward light." He proclaimed an entire community of goods, and incited the populace to plunder the houses of the wealthy. Mühlhausen fell for a time under his sway, and that of another fanatic named Pfeifer, who joined him. He took an active part in the Peasant War, and inflamed the spirits of the insurgents by the wildest speeches and songs; but they were utterly defeated on 15th May 1525, after a severe conflict, at Frankenhausen, by the Elector John and Duke George of Saxony, the Landgrave of Hesse, and the Duke of Brunswick. M. fled, but was taken and carried to Mühlhausen, where he was beheaded along with Pfeifer and a number of others. He shewed no dignity or courage in the closing scenes of his life. See Strobel's "Leben Schriften und Lehren Thom. Münzer's" (Nürnb. 1795); Seidemann's "Thom. Munzer" (Dreid. and Leipz. 1842); and Heinrich Leo in the "Evangelische Kirchenzeitung" (Berl. 1856).

**MURÆNA**, a genus of malacopterous fishes, of those to which the name Eel is commonly given, the whole of the eels being sometimes included in the family *Muraenidae*. See EEL. The true *Muraena* have no fins, except the dorsal and anal, which are low and fleshy. They have one row of sharp teeth in each jaw. The head is very large, and the jaws are moved with great power. The M. of the Romans, or MURRAY (*M. helena*), abounds in the Mediterranean, and is sometimes of large size, four feet or more in length, golden yellow in front, and purple towards the tail, beautifully banded and mottled. It is much thicker in proportion to its length than any of the fresh-water eels. Its flesh is white and highly esteemed. It prefers salt-water, but can accommodate itself to a fresh-water pond. The ancient Romans kept and fed it in vivaria. The story of Vedius Pollio feeding his murenas with offending slaves is well known. This M. has been caught on the British shores, but very rarely.

Allied to the genus M. is the genus *Sidera*, found in the Pacific.

**MURAL CROWN**, in Heraldry, a crown in the form of the top of a circular tower, masoned and embattled. It is meant to represent the crown which was given by the Romans as a mark of distinction to the soldier who first mounted the walls of a besieged town, and fixed there the standard of the army. A mural crown supporting the crest, in place of a wreath, occurs in the achievements of several of the English nobility, and in various grants of arms made in the early part of the present century to officers who had distinguished themselves in the war. Viscount Beresford, in consequence of his gallantry at the battle of Albuera, obtained as crest, issuing out of a mural crown, a dragon's head with its neck pierced through

by a broken spear, the head of the spear point downwards being held in the mouth of the dragon.

MURAT, Joachim, king of Naples, was the son of an innkeeper at La Bastide-Fortunière, near Cahors, in France, and was born there 28th March 1767 or 1768. He was at first intended for the priesthood, and actually commenced the study of theology and canon law at Toulouse, but entered the army, and being threatened with punishment for insubordination, deserted, and after spending some time at home, proceeded to Paris, where, it is said, he was for some time a waiter at a café, but soon obtained admission into the Constitutional Guard of Louis XVI. On the outbreak of the Revolution, he was made a sub-lieutenant in a cavalry regiment. His gallantry and extreme republicanism soon won him the rank of colonel. He attached himself closely to Bonaparte, under whom he served in Italy and in Egypt, signalizing himself in many battles; rose to the rank of a general of division (1799); returned with Bonaparte to France; and rendered him most important assistance on the 18th Brumaire, by dispersing the Council of Five Hundred at St Cloud. Bonaparte now intrusted him with the command of the Consular Guard, and gave him his youngest sister, Caroline, in marriage. M. commanded the cavalry at Marengo, where he greatly distinguished himself. On the establishment of the French Empire, he was loaded with honors. He continued to command the cavalry in the armies led by the Emperor, and contributed not a little to the victory at Austerlitz, and to many other victories. In 1806, the newly-erected grand duchy of Berg (q. v.) was bestowed upon him. On 1st August 1808, he was proclaimed king of the two Sicilies by the style of Joachim I. Napoleon. He took possession of Naples, but the Bourbons, through the support of Britain, retained Sicily.

M. possessed the qualities requisite for a general of cavalry rather than those of a king. He was very deficient in political skill and energy; but by the moderation of his government, he won the hearts of his subjects. Even his love of pomp and show, and the theatrical splendor of his equipment, which were a subject of mirth in France and Germany, rather gratified the Neapolitans. He endured with difficulty the yoke of Napoleon, which left him little but the outward show of royalty. In the expedition against Russia, he commanded the whole cavalry, but on its failure, he returned to Naples, anxious and discontented. He joined the French army again in 1812, but after the battle of Leipzig, withdrew to his own dominions, determined on breaking the French fetters with which he was bound. He concluded a treaty with Austria, and a truce with the British admiral, and promised the allies an auxiliary corps. He hesitated, however, even after his new course seemed to have been decisively adopted; and finding his position insecure after Napoleon's overthrow, he entered into private communications with him at Elba. On the Emperor's return to France, M. placed himself at the head of an army of 40,000 men, and commenced a hasty war against Austria. He was defeated at Ferrara, 12th April, 1815, and again at Tolentino, 2nd May. With a few horsemen he fled to Naples, where all was insurrection and commotion; thence to the island of Ischia, and found his way to France, whilst his wife and children took refuge in the British fleet. After Napoleon's final overthrow, he found refuge in Corsica, from which he proceeded in a foolhardy manner with a few followers to the coast of Naples, and proclaimed himself king and liberator, but was presently taken prisoner, and after trial by a court-martial, was shot in a hall of the castle of Fano, on 13th October 1816. See Léonard Gallais, "*Histoire de Joachim Murat*" (Paris, 1828), and Coletta, "*Histoire des Six derniers mois de la Vie de Joachim Murat*" (Paris, 1831). His widow assumed the title of Countess of Lipona, and resided in the neighborhood of Trieste, where she died in 1839. His two sons went to the United States, where the elder, NAPOLEON ACHILLE MURAT, settled in Florida, and published a number of works on the constitution and politics of his adopted country. He died 16th April, 1847. The younger, NAPOLEON LUCIEN CHARLES, married an American lady in 1837, but suffered several reverses in fortune, and Madame Murat was obliged to open a boarding-school for the support of herself and her husband. Twice he attempted to return to France secretly (in 1837 and 1844), but failed on both occasions. The Revolution of 1848, however, opened the country to him. He attached himself closely to Prince Louis Napoleon; and was in 1849 French Ambassador Extraordinary at Turin. In 1852 he was made a senator; and in 1853 he received the title of prince. The Italian revolution appeared to present

some chances for him, but nothing came of these. He was made prisoner by the Germans at Metz in 1870.

MURATORI, Ludovico Antonio, a celebrated antiquary and historian, was born at Vignola, in the duchy of Modena, October 21, 1678. From a very early period, his predilection for historical and literary pursuits began to manifest itself; and, having entered into holy orders, without, however, accepting any ecclesiastical office, his life was devoted partly to the literature of his profession, but mainly to researches in history, both sacred and profane, especially the history of his native country. In his 22d year, he was appointed one of the librarians of the Ambrosian Library at Milan, a post which has since received equal celebrity from a successor not unworthy of the fame of M., the illustrious Angelo Mai (q. v.). Here he gave to the world his first publication, a collection of unedited Greek and Latin fragments, under the titles of "*Anecdota Græca*" and "*Anecdota Latina*." But his most important labors were reserved for the capital of his native duchy, whither, in 1700, he was recalled by the Duke of Modena, to take charge of the celebrated D'Este Library, and of the ducal archives; his only ecclesiastical preferment being that of provost of the church of St Mary, at Pomposa. From the date of his return to Modena, M. began to devote himself more exclusively to Italian history, especially to the history of medieval Italy; and his labors in this department extended over the greater part of his life. It was not until the year 1733 that the first volume of his great collection, "*Rerum Italicarum Scriptores*," appeared, and the work proceeded at regular intervals for nearly thirty years, the last of the twenty-eight folio volumes which compose it bearing the date of 1761. This immense publication, which was produced by the joint contributions of the princes and higher nobility of Italy, embraces a range from the 5th to the 16th c., and contains all the chronicles of Italy during that vast period, illustrated with commentaries and critical notices. It was accompanied by a collection of dissertations illustrative of the religious, literary, social, political, military, and commercial relations of the several states of Italy during the period, in 6 vols. folio, 1738—1742, a work which, although far from being exempt from errors, is still regarded as a treasure-house of mediæval antiquities. While engaged in these prodigious labors, M. carried on an active literary correspondence with the scholars of the various countries of Europe, and contributed essays not unfrequently to the principal historical and literary academies, of most of which he was a member. He was the first, moreover, to undertake a general History of Italy from the commencement of the vulgar era down to his own time. It is in 12 vols. 4to, and still retains its value as a book of reference, having been continued by Coppi down to the year 1819. In his capacity of archivist of the Duke of Modena, he compiled, in two vols. folio, the "*Antiquities of the d'Este Family*" (1710—1740), as well as a series of historical and polemical treatises on certain territorial questions in dispute between the House of Modena and the court of Rome. To the department of classical scholarship, M.'s collection of "*Inscriptions*" (6 vols. folio, 1739—1743), which, in this point of view, was a necessary supplement to the collection of Gruter and the other antiquaries who had preceded him, is still acknowledged as a most important contribution; and he has also left works of standard merit in the departments of jurisprudence, of literary criticism, of poetry, of biography, and even of the history of medical science. In the studies of his own profession, as well liturgical and historical, as dogmatical and even ascetical, M., although he did not follow the method of the schools, was hardly less distinguished than if he had made these the pursuit of his life. Some of his opinions were regarded with disfavor, if not directly condemned; but his vindication of himself, addressed to the learned Pope Benedict XIV., drew forth a warm and honorable testimony to the uprightness of his motives, which, without approving of the opinions to which exception had been taken, declared them free from the imputation of being contrary either to the doctrine or to the discipline of the church. Although M.'s life was essentially that of a scholar, yet his exactness in discharging the duties of a parish priest was beyond all praise, and several of the existing charitable institutions of Pomposa were founded by him. He died at Modena, January 28, 1750, in his 78th year. His works, which it would be tedious to enumerate in full detail, fill 46 volumes in folio, 34 in 4to, 13 in 8vo, and many more in 12mo. Some of these are posthumous, and were published by

his nephew, G. F. Muratori, from whom we also have a life of his distinguished uncle, in 4to, printed at Omer, 1768.

MURCHISON, Sir Roderick Impey, geologist and geographer, was born at Tarncliffe, Ross-shire, in 1792. He was educated at the Grammar-school, Durham, and having a bias for military life, next studied at the Military College, Marlow. He entered the army at an early age, and served as an officer in the 36th Regiment in Spain and Portugal. He was placed on the staff of his uncle, General Sir Alexander Mackenzie, and then obtained a captaincy in the 6th Dragoon. Quitting the army in 1816, he devoted himself to science—more especially to geology. He afterwards travelled in various parts of the globe. He found the same sedimentary strata lying in the earth's crust beneath the old red sandstone in the mountainous regions of Norway and Sweden, in the vast and distant provinces of the Russian empire, and also in America. The result of his investigations was the discovery and establishment of the Silurian system, which won for him the Copley Medal of the Royal Society, and European reputation as a geologist. His subsequent exposition of the Devonian, Permian, and Laurentian systems increased and confirmed his reputation. He explored several parts of Germany, Poland, and the Carpathians; and in 1840 he commenced a geological survey of the Russian empire, under the countenance of the imperial government. M. de Vernuil was associated with him in this great work, completed in 1845. Struck with the resemblance in geological structure between the Ural Mountains and the Australian chain, M., in his anniversary address in 1844, first predicted the discovery of gold in Australia. In 1846, six years before that metal was practically worked, he addressed a letter to the President of the Royal Geological Society of Cornwall, inciting the unemployed Cornish tin-miners to emigrate and dig for gold in Australia. He was elected President of the British Association for the Advancement of Science in 1846; President of the Royal Geographical Society in 1844 and 1845; was re-elected in 1857, and continued to hold that post till 1870, when he was compelled to resign it by paralysis. His anniversary addresses to the geographers were of great interest and value. Perhaps no man of the present century has done more to promote geographical science at home, and kindle a spirit of adventure among those engaged in Arctic exploration on the one hand, and African discovery on the other. In 1855, he succeeded Sir H. De la Beche in the office of Director of the Museum of Practical Geology. He was a D.C.L. of Oxford, LL.D. of Cambridge, and a Vice-president of the Royal Society. He was knighted in 1846, made K.C.B. in 1858, and a baronet in 1863. From the Emperor of Russia he received the Grand Cross of St Anne, and also that of St Stanislaus. He died 23d October 1871. The greater portion of his contributions to science were published in the "Transactions" of the Geological and other Societies. His principal works were "The Silurian" (1836); "The Geology of Russia in Europe and the Ural Mountains," in 1845 (2d ed. 1853). He also published volumes on the "Tertiary Deposits of Lower Styria," &c. (1830), the "Geology of Cheltenham" (1834), &c.—See "Life of Sir Roderick M." by Arch. Geikie, LL.D. (1875), and obituary notice by Sir Henry Rawlinson in "Proceedings of the Royal Geographical Society," vol. xvi. No. 4.

MURCHISONIA, a genus of fossil gasteropodous mollusca belonging to the family *Heliotidae*, and so named in honor of Sir R. I. Murchison. The genus consists of at least 50 species, all which are characteristic of the Palæozoic rocks, occurring in the series from the Lower Silurian up to the Permian. The shell differs from the large genus *Pleurotomaria* only in being very much elongated. Like it, the whorls are sculptured and zoned, the aperture is channelled in front, and the outer lip is deeply notched.

MURCIA, a former province of Spain, now subdivided into the smaller provinces of Albacete and Murcia, is situated in the south-east of the peninsula. It is bounded on the n. by New Castile, on the e. by Valencia, on the s. by the Mediterranean, and on the w. by Granada, Andalusia, and New Castile. Area, 10,311 sq. m. Pop. (1870) 660,040 (of modern province, 439,067). In the n.-e., the province is partly level; but in the s.-w., it is composed of great valleys, high plateaus, and mountain ranges. The coast comprises stretches of desert. The principal river is the Segura, which flows through the middle of the province from w. to e. On the whole, M. is not very productive, and never will be, on account of the failure of water, partly caused by the

Muro's  
Murida

326

destruction of the forests. The only fertile districts are the valleys of the Segura, and the side-valleys of Lorca, Albacete, Chinchilla, and Almansa. The Esparto wastes have remained uncultivated since the banishment of the Moriscos in 1610; and the canal of M., which is intended to irrigate the arid Campo de Cartagena, is not yet finished. M. is one of the most thinly peopled districts of Spain. The north yields wheat and barley; the south, maize, fruits, wine, oil, silk, and hemp. Goats, sheep, and swine are reared in great numbers. In metals, salt, and mineral springs, M. is abundant; it has also many smelting-works for iron, lead, and copper ore, brimstone and alum. The roads, however, are in the most wretched condition, and industry in general is still in a backward state. The province was frightfully devastated by a great earthquake, 18—21 March 1829. M. was conquered by the Arabs in 711; after the fall of the califate of Cordova, it became an independent Arab kingdom, but, six years afterwards, was subjugated by King Ferdinand III. of Castile in 1241.

MURCIA (the Roman *Murgis*), a large, important, and ancient town of Spain, capital of the province of the same name, on the left bank of the Segura, and near the junction of that river with the Saugonera, 50 miles south-west of Alicante. It stands in the midst of a beautiful and luxuriantly productive *huerta* or garden, 16 miles in length, and from 7 to 8 miles wide. This *huerta* forms a portion of what is called the vale of M.; is well watered, has a bright green appearance even in winter; produces wheat, flax, pulse, and vegetables, and grows innumerable mulberry, orange, fig, and palm trees. The streets of M. are narrow but clean, and the houses are gaudily painted in pink and yellow. Its squares are filled with cypress, orange, lemon, and other southern trees. It is the see of a bishop suffragan to Toledo; the cathedral is surmounted by a tower begun in 1532, completed 1766, and crowned by a dome from which a magnificent view is obtained. The city contains few objects of fine art, a circumstance which is accounted for by the fact that, on the occasion of its siege by Sebastian, that general, after promising that persons and property should be respected, entered the town 23d April 1610, and rifled it of its wealth and art-treasures. Silks, linens, baskets, mats, and cordage are manufactured, and oil-mills, tanneries, and other works are in operation. Pop. 80,000.

MURDER is the crime of killing a human being of malice aforethought, and is punishable with death. It is immaterial what means are employed to effect the object. Blackstone says that the name of murder, as a crime, was anciently applied only to the secret killing of another, which the word *moerda* signifies in the Teutonic language. And among the ancient Goths in Sweden and Denmark, the whole vill or neighborhood was punished for the crime, if the murderer was not discovered. Murder is defined by Coke thus: "When a person of sound memory and discretion unlawfully killeth any reasonable creature in being, and under the king's peace, with malice aforethought, either express or implied." Almost every word in this definition has been the subject of discussion in the numerous cases that have occurred in the law-courts. The murderer must be of sound memory or discretion; i. e., he must be at least 14 years of age, and not a lunatic or idiot. The act must be done unlawfully, i. e., it must not be in self-defence, or from other justifiable cause. The person killed must be a reasonable creature, and hence killing a child in the womb is not murder, but is punishable in another way (see INFANTICIDE). The essential thing in murder is that it be done maliciously and deliberately; and hence, in cases of hot blood and scuffling, the offence is generally manslaughter only. Killing by duelling is thus murder, for it is deliberate. It is not necessary, in order to constitute murder, that the murderer kill the man he intended, provided he had a deliberate design to murder some one. Thus, if one shoots at A, and misses him, but kills B, this is murder, because of the previous felonious intent, which the law transfers from one to the other. So if one lays poison for A, and B, against whom the poisoner had no felonious intent, takes it, and is killed, this is murder. Formerly, in England, the Benefit of Clergy (q. v.) was allowed in cases of murder, till it was abolished by 7 and 8 Geo. IV. c. 28. The only sentence on murderers is now death, which is carried out by hanging. Formerly, the murderer was directed after death to be hung on a gibbet in chains near the place of the crime. Formerly, also, dissection was added as part of the sentence, and the execution was to take place on the day next but one after sentence. But now an interval of a fortnight usually

takes place, and the body is buried in the precincts of the prison. Attempts to murder were until recently punishable in England like capital felony; but now attempts to murder are punishable only with penal servitude for life, or for not less than three years.

MUREX, a Linnæan genus of gasteropodous molluscs, of which has now been formed the family *Muricidæ*, belonging to the order *Pectinibranchiata* of Cuvier. The sexes are distinct; the animal has a broad foot, often much expanded; the eyes are not on stalks; the shell has a straight canal in front, often prolonged through part of a very long beak; no canal behind. The *Muricidæ* all prey on other molluscs, boring through the shells with their hard-toothed proboscis. The name ROCK-SHELL is often given to many species of *M.*; and some, from the length of the beak, are called WOODCOCK-SHELL. Some have the shell beset with long and regularly arranged spines. The whorls of the shell are marked with ridges, or *varicoses*. Some species of *M.* are found on the British coasts. Species are found in all parts of the world; the largest are tropical. The ancients obtained their purple dye (see TYRIAN PURPLE) from species of *M.*, particularly *M. trunculus* and *M. brandaris*. The VENUS COMB of the Indian seas is *M. tribulus*, a very delicate and beautiful shell, with many long thin spines. Fossil *Muricidæ* are numerous, but are scarcely found in any formation older than the eocene tertiary.

MUREXIDE, Purpurate of Ammonia, or Roman Purple, a curious coloring matter obtained from guano. It is similar to the purple dye or Tyrian purple of the ancients, which was made from a species of *Murex*—hence its name. Murexide is a product of uric acid, and as this exists in abundance, and in a very free state, in guano, that material has been found one of the best sources from which to obtain it. One process used by Mr Rumney of Manchester, the chief manufacturer of this material, to produce murexide, is to dissolve uric acid in dilute nitric acid, and after evaporating for some time at a temperature a little short of boiling, whilst still hot, to add a slight excess of ammonia. Two compounds are formed by this process, Alloxan and Alloxantin, and their mutual reaction on each other results in the formation of the beautiful minute green metallic-lustred crystals of murexide, which, in combination with some of the compounds of lead and mercury, yield most brilliant red and purple dyes. The use of murexide was becoming extensive until the discovery of the aniline colors, the greater brilliancy of which has checked its employment. Murexide is used in printing both cotton and silk goods, which, under the name of the "Roman-purple style" has been brought to great perfection by several large firms.

MURGAB, a river of Central Asia, which rises on the northern border of Afghanistan, in the Hindu Kush, immediately to the north of the sources of the Heri (q. v.). The *M.* flows westward, then north-westward, and finally northward, passing from amongst the mountains in which it has its source into the desert plains of Turkestan, where the volume of its water gradually diminishes, until it finally loses itself in a swamp in the sandy plain of Merv, after a course of about 400 miles. In the upper part of its course it receives many tributaries, but none in the lower. The most noteworthy place on its banks is Merv, or Meru (anc. *Antiochia Margiana*), a town of Independent Turkestan, about 800 miles south-east from Khiva. Merv was an important town in the days of the Seljuk dynasty, of which it was the capital, but is now very ruinous.

MURIATIC ACID. See HYDROCHLORIC ACID.

MURIDÆ, a family of rodent quadrupeds, containing many genera and a very large number of species, distributed over all parts of the world, and of which rats and mice may be regarded as typical examples. To this family belong also voles, lemmings, dormice, jerboas, marmots, &c. The *M.* are of the section of rodents having distinct clavicles. They have three or four molars on each side in each jaw, the molars at first furnished with rounded tubercles, which wear down till they exhibit mere roughened crowns. The typical *M.*, and those most nearly allied to them, have scaly tails. Marmots, dormice, jerboas, &c., have hairy tails. There are great diversities of structure and habits among the Muridæ. All of them feed on vegetable food, but many of them are ready also to eat animal substances.—The limits of the family *M.* are very differently stated by different naturalists.

**MURILLO**, Bartholomé Estéban, was born at Seville, and baptised Jan. 1, 1618; and after receiving some education, was placed with his relative, Juan del Castillo, to study painting. Having saved a little money, which he made by painting religious pictures for exportation to South America, he went to Madrid in 1641, being then in his 24th year, was favorably noticed by his celebrated townsman, Velasquez, and through his influence, was enabled to study the *chef-d'œuvre* of Italian and Flemish art in the royal collections. In 1645, he determined to return to Seville, though advised to proceed to Rome by Velasquez, who offered him letters from the king. After settling in Seville, he received numerous important commissions, and was soon acknowledged as the head of the school there. In 1648, M. married a lady of fortune; he now maintained a handsome establishment, and his house was the resort of people of taste and fashion. The Academy of Seville was founded by him in 1660, but he filled the office of president only during the first year. He fell from a scaffold when painting in Cadiz on an altar-piece for the Church of the Capuchins, returned to Seville, and soon after died from the injury he received, April 8, 1682. In early life, he painted many pictures illustrative of humble life; in these, the manner was darker and less refined than that exhibited in his later pictures, which are mostly scriptural or religious pieces. In the Louvre, and in England, there are about forty of his works. Sir David Wilkie, who greatly admired and carefully studied the Spanish school, has remarked, in reference to it: "Velasquez and Murillo are preferred, and preferred with reason, to all the others, as the most original and characteristic of their school. These two great painters are remarkable for having lived in the same time, in the same school, painted for the same people, and of the same age, and yet to have formed two styles so different and opposite, that the most unlearned can scarcely mistake them; Murillo being all softness, while Velasquez is all sparkle and vivacity."

**MUR'RO**, an episcopal town of South Italy, in the province of Potenza, 17 miles north-west of the town of Potenza. Its castle, built on a height overlooking the ravine, was the scene of the murder of Joanna I., queen of Naples. Pop. 8333.

**MURO'M**, or Moorom, a town in the south-east of the government of Vladimir, in European Russia, 70 miles east-south-east of Vladimir, and situated on the right bank of the Oka, a tributary of the Volga. Pop. (1867) 11,236. The chief industrial establishments are tanneries and sail-cloth and linen factories. The fisheries on the Oka supply the surrounding country. M. is also noted for its orchards and kitchen-gardens, the latter of which supply a great portion of Russia with cucumber-seed of the first quality. Gypsum quarries in the neighborhood are extensively worked during winter. There is a large trade in wheat, flax, linseed, and timber. M. has a very picturesque appearance, and was formerly surrounded by impenetrable forests. It is frequently mentioned in the old national ballads, and is one of the most ancient towns of Russia.

**MURRAIN** is the generic term loosely used to designate a variety of diseases of domestic animals, but more correctly restricted to the vesicular epizootic, popularly known as the mouth and foot disease. It is a contagious eruptive fever, affecting cattle, sheep, pigs, and poultry; but rarely communicable to horses or men. It is characterised by the appearance of little bladders or vesicles in the mouth, on the lips, gums, and tongue; on the udder, and in the interdigital space; causing inability to eat, and drivelling of saliva, heat and swelling of the udder, and lameness. The disorder runs a fixed and definite course usually in eight or ten days. Good nursing, comfortable lodgings, and a liberal supply of soft, easily digestible food, are the chief requisites for speedy recovery. A laxative may be given if needed. The mouth may be washed out twice daily with a mild astringent solution, which may be made with half an ounce of alum, oxide of zinc, or sugar of lead, to the quart of water. The udder in milch cows, in which the complaint is usually most serious, should be bathed with tepid water before and after milking, which must be attended to very regularly; and the feet kept clean, and washed occasionally with the lotion used for the mouth.

**MURRAY**, or Moray, James Stewart, Earl of, sometime called the "Good Regent," was the natural son of James V. of Scotland, by Margaret, daughter of John, fourth Lord Erskine, afterwards wife of Sir Robert Douglas of Lochleven. He was born about 1581, made Commendator of the priory of St Andrews in 1588,

and subsequently of the priory of Mâcon (in France). He joined the Reformers in 1554, and almost immediately became the chief of the Protestant party in Scotland. In 1561, he was sent to France, to invite Queen Mary to return to her kingdom; and on her arrival, he became her prime minister and adviser. In February 1562, he was created Earl of Mar; but that earldom having been claimed by Lord Erskine, the title of Earl of Moray was conferred upon him instead a few months afterwards. Strongly opposed to the marriage of Mary with Lord Daruley, 29th July 1565, he endeavored to oppose it by an appeal to arms; but he was easily put to flight by the queen, and obliged to take refuge in England. He did not return to Edinburgh till the 10th March 1566, the day after the assassination of Riccio, in which he was an accomplice. In April 1567, he went to France, but was recalled in August of the same year by the lords in arms against the queen, when he found Mary a prisoner in Lochleven, and himself appointed regent of the kingdom. After the escape of the queen, he defeated her forces, May 15, 1568, at Langside, near Glasgow, and was afterwards one of the commissioners sent to England to conduct the negotiations against her. By his prompt and vigorous measures, zeal, and prudence, he succeeded in securing the peace of the kingdom, and settling the affairs of the church, but was assassinated at Linlithgow by Hamilton of Bothwellhaugh, January 21, 1570.

MURRAY, John, the name of three generations of English publishers, will for ever remain associated with the palmiest days of English literature in the 18th and 19th centuries. The founder of the house, John M'Murray, was born in Edinburgh about 1746. He obtained a commission in the Royal Marines in 1762, and in 1768 was still second-lieutenant, when, disgusted with the slowness of promotion, and panting for a more active career, he purchased the bookselling business of Mr Sandry, opposite St Dunstan's Church, London; and, dropping the Scottish prefix, became a bookseller and publisher at "32 Fleet Street." He brought out the "English Review," and published the elder Disraeli's "Curiosities of Literature," &c. He could himself wield the pen, as some pamphlets remain to testify. He died November 16, 1793, and was succeeded in due time by his son JOHN, who was left a minor of fifteen at his father's death. One of the earliest hits of John the second was Mrs Rundell's Cookery-book, which proved to be a mine of wealth—more productive, perhaps, than "Childe Harold" itself. He became connected with Thomas Campbell and Sir Walter Scott, and in 1808—1809, projected the "Quarterly Review," a Tory organ, in opposition to the Whig "Edinburgh Review," then in the height of its influence. The first number was published February 1, 1809, under the editorship of William Gifford. The new periodical was completely successful, and brought M. into communication not only with the chief literati, but also with the Conservative statesmen of the time. A still more fortunate acquaintance was that with Lord Byron, whose "Childe Harold" was published by M. in 1812. M. now removed from Fleet Street to Albemarle Street, where the business is still carried on. Here Byron and Scott first met, and here Southey made the acquaintance of Crabbe. Almost all the literary magnates of the day were "four o'clock visitors" in Albemarle Street. Byron's pleasant verse has described the scene:

"The room's so full of wits and bards,  
Crabbes, Campbells, Crokers, Freres, and Wards."

M.'s dinner-parties included politicians and statesmen, as well as authors, artists, and dilettanti. M. paid Byron nearly £20,000 for his works, and his dealings with Crabbe, Moore, Campbell and Irving, were princely. The second John M. died in his 65th year, in 1843, and was succeeded by his son, JOHN M. the third. Born in 1798, he was educated first at the Charter House, and afterwards at Edinburgh University. The age of Byron had gone by, when, in 1843, he succeeded to the business of his father and grandfather. A more practical and realistic age had succeeded, and the "Home and Colonial Library," issued to beat off foreign and American prices, was the precursor of the cheap railway and other literature of the present day. A lively and vigorous competition, arising out of the wants of a new era, has somewhat altered the relation of the great publishing houses. That of Albemarle Street no longer ranks first in the extent and variety of its transactions, but many of the greatest works in history, biography, travel, art, and science have issued from the Albemarle Street press under the régime of the third Murray. Among his later successes may be mentioned Dr Livingstone's "Travels" and "Last Journals," Smiles's "Life

of George Stephenson," and Charles Darwin's "Origin of Species by Natural Selection." His handbooks of continental travel have lately been supplemented by handbooks of English counties, and these, it is understood, owe much to the personal assistance and superintendence of the present head of the famous house of Murray.

MURRAY, Lindley, an English grammarian, was born at Swatara, Lancaster County, Pennsylvania, U.S., in 1745. He was educated at an academy of the Society of Friends, and, on his father's removal to New York, was placed in a counting house, from which he escaped to a school in New Jersey. He then studied law, and was admitted to the bar at the age of 21, and commenced a good practice. During the revolutionary war he engaged in mercantile pursuits with such success as to accumulate a handsome fortune. His health failing, he came to England and purchased the estate of Holdgate, near York, where he devoted himself to literary pursuits. In 1787, he published his "Power of Religion on the Mind," which passed through seventeen editions. His "Grammar of the English Language" was issued in 1795, and was followed by "English Exercises," the "Key," the "English Reader," "Introduction and Sequel," and a "Spelling Book." There can be no stronger indication how entirely the systematic study of the English language was—until recent years—neglected by scholars, than the fact that M.'s Grammar was for half a century the standard text-book throughout Britain and America. M. wrote an autobiography to the year 1809, which was published after his death, February 16, 1826.

MURRAY RIVER, the principal river of South Australia. See AUSTRALIA.

MURSHEDABA'D, a town of India, capital of a British district of the same name in Bengal proper, is situated on the left bank of the Bhagratī, a branch of the Ganges, about 124 m. n. of Calcutta. On the opposite side of the river stands Mahinagar, usually reckoned a part of M. The town occupies a great space, being several miles both in length and breadth, but the buildings are for the most part of mud. It contains two palaces; the one, old and gloomy; the other, constructed after the European style, and of great beauty, was completed in 1840. Situated on the most frequented route by water from Calcutta to the North-West Provinces, the trade of M. is important. Formerly, it was the capital of Bengal, and so wealthy, that Clive compared it with London. Pop. (1871) 46,184, of whom about 60 per cent. are Hindus, and 40 per cent. Mohammedans.

MURVIE'DRO, a small town of Spain, in the province of Valencia, and 18 miles north-north-east of the city of that name on the left bank of the Palancia, and two miles from its mouth. Pop. about 5000. It stands on the site of the ancient Saguntum (q. v.).

MURZU'K. See FEZZAN.

MUSACEÆ, a natural order of endogenous plants, the largest of herbaceous plants, generally destitute or almost destitute of true stems, yet resembling trees in appearance, and sometimes rivaling palms in stateliness; the long sheathing bases of the leaf-stalks combining to form a false stem. The blade of the leaf has many fine parallel veins proceeding from the midrib to the margin. The flowers are congregated on spadices, which are protected by spathe. The fruit is either a 3-valved capsule or fleshy.—The species are not numerous; they are natives of warm climates, in which they are widely distributed, and are of great value to the inhabitants of tropical countries; the fruit of some, particularly of the genus *Musa*, being much used for food, whilst the fibres of the leaves are employed for cordage and for textile purposes. See PLANTAIN, BANANA, and ARACA. A very interesting plant of the order M. is the TRAVELLER'S TREE (q. v.) of Madagascar.

MUSAUS, Johann Karl August, a German writer, born in 1737 at Jena, where he studied theology, was nominated to a country church, but prevented from entering upon the cure committed to him in consequence of the opposition of the peasantry of the parish, who refused to receive him on the ground that he had been once seen to dance. In 1763, he received the appointment of tutor to the pages at the ducal court, and in 1770 he became professor at the Weimar gymnasium. His first literary production, which appeared in 1760, was a parody of Richardson's "Sir Charles Grandison," which was at that time extravagantly admired in Germany.

The success of this satirical squib was complete; but as literary fame did not bring with it a corresponding amount of pecuniary reward, M. was compelled to gain his living by other means than writing; and an interval of more than eighteen years elapsed before he found leisure to reappear as an author. In 1778, he published his "*Physiognomischen Reisen*," in which he endeavored, by good natured yet striking satire, to counteract the absurd uses to which the Germans of his day had turned Lavater's system. This, like his previous work, was pre-eminently successful, and encouraged by the marks of popular favor with which it was received, he laid aside his incognito, and continued to devote himself to authorship. In 1782, appeared his charming version of German folk-lore, under the title of "*Volksmärchen der Deutschen*," which professed to be merely a collection of popular tales noted down from the lips of illiterate old country people; but these tales were tinged with such a blending of genial humor, quaint fancy, and strong sense, that they have become a classical work of their kind, popular among persons of every age and class. His satirical sketches, entitled "*Freund Heins Erscheinungen in Holbein's Manier*," (Winterthur, 1785), maintained his reputation as one of the sprightliest and most genial satirists of his country. Under the name of Schellenberg, he began a course of tales, "*Straussfedern*" (Berl. 1787), which, however, he did not live to complete. He died in 1787. His "*Moralische Kinderklapper*" appeared the year after his death, while his other posthumous writings were edited in 1791, with an interesting notice of the author, by his relative and pupil, A. V. Kotzebue. M.'s style was at once correct and elegant, adapting itself with singular flexibility to the various subjects which he handled; while the unaffected geniality and frank loving nature which are reflected in all he wrote, have deservedly made him one of the most popular writers of his day in Germany.

MUSÆUS, one of the ancient Greek poets of the mythic period, is said to have been the son of Eumolpus and Selene; according to others, the son and pupil of Orpheus. To him was ascribed the introduction of the Eleusinian and other mysteries into Greece, and the ordering of many religious rites. He was among the ancients also the reputed author of a number of poems, oracles, purificatory verses, a war of the Titans, a theogony, hymns, &c.; but of the few verses which remain the authenticity is very doubtful.—A later MUSÆUS, who probably flourished about the end of the sixth c. of the Christian era, was the author of a very pleasing amatory poem, in Greek, entitled "*Hero and Leander*," discovered in the 13th c., of which the first edition was published by Aldus Manutius about 1494, and of which there have been many subsequent editions.

MUSCÆ VOLITANTES is the term applied to ocular spectra, which appear like flies on the wing, or floating black spots before the eyes. There are two kinds of muscæ volitantes—the one a perfectly harmless kind, while the other is symptomatic of one of the most serious diseases of the eyes, viz., amaurosis.

Whoever will look through a minute pin-hole in a card at the clear sky may see floating before his sight a number of translucent tubes or fibres, and many little beads, of which some are separate, some attached to the tubes, and some apparently within them. Some of the tubes or fibres are straight, others looped or twisted, and others again forked. All these objects are bright in the middle, and bounded by fine black lines, beyond and parallel to which may be seen an appearance of colored lines or fringes. The doublings and crossings of the loops or knots in the twisted fibres appear as black points. Though the eye be fixed, these bodies change their position with greater or less rapidity. Now, in ordinary light and vision all these objects are imperceptible, unless the knots or fibres happen to be larger than usual, when they constitute the harmless kind of muscæ volitantes. The black lines and fringes are phenomena of the inflexion or diffraction (q. v.) of light, which are never seen except in divergent rays, and all muscæ volitantes having such fringes must be situated at a greater or less distance from the retina; and there are conclusive reasons for believing that they occupy the vitreous humor, and cannot therefore portend amaurosis; whereas those black spots which have no fringes, and which do not move, or which move only with the motions of the eye, are points in the retina which are insensible to light, and are therefore to be regarded as symptomatic of danger to vision. To decide, then, whether the muscæ volitantes are or are not indicative of danger, the patient should fix his eye on a white surface (as a sheet of

Muscardine  
Musco

334

letter-paper) after a sudden shake of the head; if they sink gently downwards, they are innocent. It should perhaps be added, that though they seem to descend, they must in reality be ascending; floating up in the vitreous humor as far as the cellular partitions formed by the hyaloid membrane will permit. See *ERY*. For further information on the differences between the innocent and the dangerous forms of *musca volitantes*, the reader is referred to an article by Sir David Brewster in the "North British Review" for November 1856.

MU'SCARDINE, or Silk-worm Rot (*Botrytis Bassiana*), a fungus (see *BOTRYTIS*) which grows on silk-worms, and often kills them in great numbers. It consists of erect branching threads, with clusters of spores at the end of short lateral branches. The spores of this fungus germinate even on healthful silk-worms, and in circumstances otherwise most favorable to their healthfulness. They germinate also on the caterpillars of other lepidopterous insects. When this pest appears among silk-worms, its progress cannot be checked by any means known. For prevention, it is most important that the silk-worms be not overcrowded.

MUSCAT, or Maskât, an independent Arab state, forming the sea-coast of Omân, in Eastern Arabia. It extends from the Strait of Ormus to the Island of Mosclrah, and nowhere exceeds 150 miles in width. The coast and interior are both sterile, but the country is studded with very fertile oases. The capital is Muscat (population, 60,000), on the Persian Gulf, a fortified town, surrounded with gardens and date-palms. It has a very good harbor, which, in the winter months, is reckoned the best refuge in the Indian Ocean, and is a most important centre of trade, where the productions of Europe, of Africa, and of the East are exchanged. The principal exports are Arabian coffee and pearls obtained from the Persian Gulf; but wheat, dates, raisins, salt, sulphur, drugs, and horses are also exported. The independence of Omân dates from 761, when the people elected a sovereign of their own. For 900 years the Imams were elected for personal merit, and afterwards from members of personal merit, and afterwards from members of a ruling family. M. was taken by Albuquerque in 1507, and remained in the hands of the Portuguese till 1643, when the Arabs recovered possession of it. The Imams afterwards made extensive conquests in Eastern Africa, including Zanzibar, Mombas, Quiloa, &c. In 1793, they acquired possession of the coasts of Laristan and Mogistan, the islands of El Kishim and Ormus, and the town of Bender Abbas in Persia, paying to the Shah a rent or tribute of 6000 tomanas. The state was very prosperous under the wise and mild sway of Said Seid, the late Imam. He ascended the throne in 1803, at the age of 16, and reigned till his death in 1856. He was long a faithful ally of England. In 1834, the Imams were driven from their Persian dependencies, which in their opinion belonged to them in perpetuity so long as they paid the rental. They recaptured Bender Abbas, but in consequence of English interference, they were compelled to conclude a treaty with Persia in April 1856. This is said to have broken the heart of the old Seid, who died on 19th Oct., 1856. He appointed his son Majid to succeed him in Zanzibar, and his son Thuwani to succeed him in Muscat. The latter was murdered by his son Salim in 1863, who reigned for a short time, but was driven out by his uncle, Sayed Tuky. In consequence of the unsettled state of affairs in M., Persia has assumed the government of Bender Abbas and the Persian coast territory. See ZANZIBAR and WAHABIS.—See "History of the Imams and Seyids of Omân," by Sahib-ibn-Razik, from the Arabic, by Rev G. P. Badger (1871); Markham's "History of Persia" (1874).

MUSCATEL (Ital. *moscodo*, musk), the name given to many kinds of sweet and strong French and Italian wines, whether white or red. Amongst the finest are the white Rivesalt and red Bagnol wines from Roussillon, and the Lunel from the Pyrenees, the Lacrymæ Christi and Carigliano of Naples, &c.

MUSCATINE, a city of Iowa, U. S., is on the west bank of the Mississippi, 100 miles above Keokuk, and 82 south-east of Iowa city. It has a large trade by the river, and several railroads, three steam flour-mills, planing-machines, four large saw-mills, which annually produce about 80,000,000 feet of timber, besides shingles, &c. There are 14 churches, schools, newspapers, &c. Pop. (1880) 8,223.

MUSCHELKALK (Ger. shell-lime), the middle member of the Triassic, or New Red Sandstone period, the beds of which are entirely absent from the British strata.

Being typically developed in Germany, the foreign name has been universally adopted to designate them. They consist of (1st) a series of compact, grayish, regularly-bedded limestone, more than 300 feet thick; and (2d) alternations of limestone, dolomite, marl, gypsum, and rock-salt, nearly 300 feet thick. The limestone abounds in the remains of Mollusca. The palæozoic Goniatites are replaced by the Ceratites, a remarkable link between them and the Secondary Ammonites. Ceratites are distinguished by the few small denticulations of the inner lobes of the suture. The heads and stems of Lily encrinurites (*Eucrinus*) are also abundant in these strata, and the remains of ganoid fish have also been met with.

MUSCUL. See Mosasa.

MUSCICAPIDÆ, a family of birds of the order *Insectores* and tribe *Dentirostres*, of which the greater number receive the popular name Fly-catcher (q. v.). The limits of the family are, however, very variously defined by different ornithologists. The *M.* are mostly inhabitants of the warmer parts of the world, in which they are very widely diffused. The species are very numerous.

MUSCIDÆ, a family of dipterous insects, having a short, thick membranous proboscis, geniculated at the base, entirely retractile so as to be concealed within the mouth, and terminated by two large lobes (see HOUSE-FLY); the antennæ three-jointed; the thorax with a transverse suture. The species are very numerous, and universally distributed. More than 800 are found in Britain, among which are the well-known House-fly, Blow-fly, &c. The larvæ are Maggots (q. v.). Although some of the *M.* are troublesome, none of them are so much so as species of some other allied families.

MUSCLE AND MUSCULAR TISSUE. Muscular tissue is specially distinguished by its contractile power, and is the instrument by which all the sensible movements of the animal body are performed. When examined under a high magnifying power, the fibres of which it is composed are found to exist under two forms, which can be distinguished from one another by the presence or absence of very close and minute transverse bars or stripes. The fibres of the *voluntary* muscles—or those whose movements can be influenced by the will—as well as the fibres of the heart, are *striped*; while those of the *involuntary* muscles—the muscular structures over which we have no control—as, for example, the muscular fibres of the intestinal canal, the uterus, and the bladder, are *unstriped*.

On examining an ordinary voluntary muscle with the naked eye (a muscle from one of the extremities of any animal, for example), we observe that it presents a fibrous appearance, and that the fibres are arranged with great regularity in the direction in which the muscle is to act or contract (for it is by their inherent power of contracting that muscles act). On closer examination, it is found that these fibres are arranged in *fasciculi*, or bundles of various sizes, enclosed in sheaths of areolar tissue, by which they are at the same time connected with and isolated from those adjoining them; and when the smallest *fasciculus*, visible to the naked eye, is examined with the microscope, it is seen to consist of a number of cylindrical fibres lying in a parallel direction, and closely bound together. These *primitive* (or, as some writers term them, the *ultimate*) fibres present two sets of markings or *striae*—viz., a longitudinal and a transverse set. The fibres, when separated from each other, frequently split longitudinally into *fibrille*. Sometimes, however, when a fibre is extended, it separates in the direction of the transverse striae into a series of discs. Either cleavage is equally natural, but the latter is the least common. Hence, observes Mr Bowman, who has specially investigated the minute structure of the voluntary muscle, "it is as proper to say that the fibre is a pile of discs as that it is a bundle of fibrille; but, in fact, it is neither the one nor the other, but a mass in whose structure there is an intimation of the existence of both, and a tendency to cleave in the two directions. If there were a general disintegration along all the lines in both directions, there would result a series of particles, which may be termed *primitive particles* or *sarcous elements*, the union of which constitutes the mass of the fibre. These elementary particles are arranged and united together in the two directions, and the resulting discs, as well as fibrille, are equal to one another in size, and contain an equal number of particles. The same particles compose both. To detach an entire fibrilla is to abstract a particle of every disc, and *vice versa*." The fibres are supplied with vessels and nerves which lie in the intervals between them,

and are attached by their extremities through the medium of tendon or aponeurosis to the parts which they are intended to move. Aggregated in parallel series, of greater or lesser size, and associated with nerves, vessels, tendinous structures, &c., they form the various MUSCLES, which are for the most part solid and elongated, but are sometimes expanded (as in the diaphragm) into a membranous shape. The length of the fibres is usually about that of the muscle in which they may occur, and may vary from two feet or more (in the sartorius muscle) to less than two lines (in the stapedius muscle in the middle ear); while their width varies from 1-60th to 1-1500th of an inch, being largest in crustaceans, fishes, and reptiles, where their irritability, or property of contracting under the action of a stimulus, is most enduring, and smallest in birds, where it is most evanescent. Their average width in man is about 1-400th of an inch, being about 1-352d of an inch in the male and 1-454th of an inch in the female. The average distance between the striæ, or the size of the sarcolem elements, in the human subject is 1-9400th of an inch, the extremes being 1-15000th and 1-6000th of an inch, according to the contraction or relaxation of the fibre. The form of the fibres is polygonal, their sides being flattened against those of the adjoining fibres. Each fibre is enclosed in a transparent, very delicate, but tough and elastic tubular sheath, which cannot always be readily seen, but is distinctly shewn stretching between the separated fragments of a fibre which has been broken within it, for its toughness will often resist a force before which its brittle contents give way. This tubular sheath is known as the *sarcolemma* or *myolemma*—the former term being derived from the Greek words *sarx*, flesh, and *lemma*, a skiu or husk; and the latter, from the Greek words *mûs*, a muscle, and *lemma*.

It was for a long time believed that the contraction of a muscle was associated with a change in the direction of each fibre from a straight line to a sinuous or zig-zag course. The investigations of Mr Bowman have, however, shewn that this view is erroneous. He has proved that in a state of contraction there is an approximation of the transverse striæ, and a general shortening with a simultaneous thickening of the fibre, but that it is never thrown out of the straight line, except when it has ceased to contract, and its extremities are acted on by the contraction of adjacent fibres.

Muscles grow by an increase, not of the number, but of the bulk of their elementary fibres; and Mr Bowman believes "that the number of fibres remains through life as it was in the fœtus, and that the spare or muscular build of the individual is determined by the mould in which his body was originally cast."

The structure of the *involuntary* or *unstriated* muscles must now be considered. This form of muscular tissue most commonly occurs in the shape of flattened bands of considerable length, but of a width not exceeding 1-2000th or 1-3000th of an inch. These bands are translucent, and sometimes slightly granular, and are usually marked at intervals by elongated nuclei, which become much more apparent on the addition of acetic acid. Kölliker has shewn that every one of these bands or fibres is either a single elongated cell (a fibre-cell) or is a fasciculus of such cells. These fibres have not usually fixed points of attachment like the striated fibres, but form continuous investments around cavities within the body—such as the intestinal canal, the bladder, the uterus, the blood-vessels, &c.—or are dispersed through the substance of tissues, such as the skin, to which they impart a contractile property.

The chemical composition of ordinary (or voluntary) muscle is described in the article FLESH. It is only necessary to add that the fibrillæ, or the sarcolem elements of which they are composed, consist of a substance termed SYNTONINE (q. v.), which closely resembles the fibrine or coagulating constituent of the blood; and that the same syntonine is also the main constituent of the unstriated muscles, or at all events of their fibre-cells. Like the blood-fibrine, it exists in a fluid form in the living tissue, and only coagulates or solidifies after death.

Our limited space prevents even an allusion to the arrangement and distribution of blood-vessels, nerves, and areolar-tissues in muscular structures; and we therefore pass on to the consideration of the muscles and their functions.

Muscles vary extremely in their form. In the limbs they are usually of considerable length, surrounding the bones and forming an important protection to the joints; while in the trunk, they are flattened and broad, and contribute very essentially to form the walls of the cavities which they enclose. There is unfortunately

no definite rule regarding the nomenclature of muscles. Muscles derive their names (1) from their situation—as the temporal, pectorals, glutæals, &c.; or (2) from their direction—as the rectus, obliquus, &c., of which there may be several pairs—as, for example, rectus femoris, rectus abdominalis, rectus capitis, &c.; or (3) from their uses—as the masseter, the various flexors, extensors; or (4) from their shape—as the deltoid, trapezina, rhomboid, &c.; or (5) from the number of their divisions—as the biceps and triceps; or (6) from their points of attachment—as the sterno-cleido-mastoid, the genio-hyo-glossus, the sterno-thyroid, &c. In the description of a muscle we express its points of attachment by the words *origin* and *insertion*; the former being applied to the more fixed point or that towards which the motion is directed, while the latter is applied to the more movable point. The application of these terms is, however, in many cases arbitrary, as many muscles pull equally towards both attachments. Muscles opposed in action are termed *antagonists*, this antagonism being in most cases required by the necessity that exists for an active moving power in opposite directions. Thus, by one set of muscles, the *flexors*, the limbs are bent; while by a contrary set, the *extensors*, they are straightened. One set, termed the muscles of mastication, closes the jaws, while another set opens them; and probably every muscle in the body has its antagonists in one or more other muscles.

The skeleton, which may be termed the locomotive framework, may be regarded as a series of levers, of which the fulcrum is, for the most part, in a joint—viz., at one extremity of a bone—the resistance (or weight) at the further end, and the force (or muscle) in the intermediate portion. In most cases, in order to preserve the necessary form of the body, muscles are applied at a great mechanical disadvantage as regards the exercise of their power; that is to say, a much larger force is employed than would suffice, if differently applied, to overcome the resistance. The two main sources of this disadvantage lie in the obliquity of the insertion, and consequently of the action of most muscles, and in the muscles being usually inserted very near the fulcrum. The first of these disadvantages is in many cases diminished by the enlargements of the bones at the joints. The tendons of the muscles situated above the joint are usually inserted immediately below the bony enlargement, and thus reach the bone that is to be moved in a direction somewhat approaching the perpendicular. If this enlargement did not exist, the contraction of the muscle, instead of causing the lower bone to turn upon the upper one with comparatively little loss of power, would do little more than cause the two ends of the bones to press upon each other. The second mechanical disadvantage is compensated for by gain in the extent and velocity of movement, and by the avoidance of the great inconvenience of having the muscles extended in straight lines between the ends of jointed continuous levers. Thus the bones of the forearm are bent upon the bone of the arm by the biceps muscle which arises close to the head of the latter, and is inserted at a short distance from the elbow-joint, which acts as the fulcrum of the lever. By this arrangement, a contraction of a single inch in the muscle moves the hand, in the same time, through the extent of about 12 inches, but then the hand moves through every inch with only about the twelfth part of the power exerted by the muscle. By the junction of two or more levers in one direction, as in the different segments of the extremities, the extent and velocity of their united actions are communicated to the extreme one. Thus a blow of the fist may be made to include the force of all the muscles engaged in extending the shoulder, elbow, and wrist.

The great and characteristic property of muscular tissue—that of shortening itself in a particular direction when stimulated—is called *contractility*. The stimulus may be direct irritation by mechanical means, or by galvanism, or by some chemical substance, but in the living body the muscular fibres are, in most cases, made to contract by the immediate influence of the nerves distributed among them, which are consequently termed *motor nerves* (see NERVOUS SYSTEM), and are under the influence of the will. By an exertion of volition, we can contract more or fewer muscles at once, and to any degree, within certain limits; and as a matter of fact, there is hardly any ordinary movement performed in which several muscles are not called in play. But every voluntary muscle is also subject to other influences more powerful in their operation than the will. The movement of the features under the impulses of passion and emotion are more or less involuntary,

as is shewn by the very partial power the will has of restraining them, and the extreme difficulty of imitating them.

Many movements ensue involuntarily when certain impressions, which need not necessarily be attended with consciousness, are made on the surface of the body, or on any part of its interior, either by external or internal causes. Such movements are termed *reflex*, and are noticed in the article NERVOUS SYSTEM. Our space precludes us from noticing the individual groups of muscles in the human body. Several important groups are, however, noticed under ARM, EYE, FOOT, HAND, LEG, &c.

**MUSCULAR FORCE**, Origin of. The recent and decisive investigation of Professor Fick and Wislicenus\* of Zurich, of Professor Frankland and of Professor Parkes, have completely overthrown the physiological views on this subject held previous to the year 1866. While the inference from previous experiments was, that the effect of exercise was to cause a very large increase in the elimination of carbon, and a much smaller, but very perceptible increase in the elimination of nitrogen, Fick and Wislicenus (from observations made on the excretion of nitrogen during the ascent of the Faulhorn) deny altogether the increase of the nitrogen, and come to the conclusion, that the force generated in the muscles is the result of the burning (oxidation) of non-nitrogenous substances (fats or carbohydrates), and not of the burning of the albuminous constituents of muscular tissue; and they conclude, that the nitrogenous constituents of muscles are rather to be regarded as forming the machine in which these fats or carbohydrates are burned, than as the subjects which are burned. Dr Frankland ("Philosophical Magazine," September 1866) arrives at the conclusion that the non-nitrogenous constituents of the food, such as starch, fat, &c., are the chief sources of the actual energy which becomes partially transformed into muscular work. He does not, however, deny to the albuminous matter a co-operation in the production of muscular power, but he regards their chief use as being to renew the muscular tissue. The muscles are thus the source both of animal heat and of muscular force. One of the latest investigators of this important subject is Professor Parkes, who communicated the result of his inquiries to the Royal Society (see "Proceedings of the Royal Society," Nos. 89 and 94, 1867). Two series of experiments were made on soldiers at Netley. Two men were kept on ordinary diet and on usual work for four days; were then kept in perfect rest for two days, on a diet free from nitrogen; then finally returned for four days more to their usual food and work. In the second series, the same course was adopted, except that throughout the whole period the men took a constant quantity (30½ grains) of nitrogen daily.

The conclusions deduced by Dr Parkes from these experiments were, that Professors Fick and Wislicenus are quite correct in stating that there is no increase of nitrogen eliminated during the period of exercise. There is, on the contrary, a slight decrease. They are not correct in stating that there is no increase after exercise, for there is a perceptible, though not a very large increase. "Without going into an analysis of the experiments, which would occupy too much space, I believe," says Dr Parkes in his Sanitary Report contained in the last volume of the Army Statistical, Sanitary, and Medical Report, 1867, p. 346, "my results indicate that our ideas of the origin of muscular force and of nutrition generally, must be modified; that during action, muscles appropriate nitrogen, and grow; and that they do not give it off and waste, as was formerly supposed, or undergo no change, as Fick and Wislicenus believe. In other words, formation of nitrogenous tissues goes on during action, and removal of nitrogen goes on during rest. The mechanical force manifested during muscular action is, however, probably derived from changes in the carbohydrates, especially the fats, which changes are connected with the appropriation of nitrogen by the muscles."

The theory of muscular action which he proposes for consideration is this. During action, the muscles appropriate nitrogen; this act is accompanied by changes in the carbohydrates, which lead to the manifestation of mechanical force; these changes lead to effete products (lactic acid, &c.) in the muscles, which, as appears from Ranke's experiments, stop their contraction. Then ensues an action of oxy-

\*A translation of their Memoir may be found in the "Philosophical Magazine" for June 1866 (supplementary number).

gen upon the nitrogenous framework of the muscle, and a removal of the effeto products of the carbo-hydrates, so that the muscle becomes again capable of appropriating nitrogen, and of acting. The amount of truth in this theory must be decided by the investigations of others; it seems the only one which can explain the facts, if these have been correctly made out.

Although it is mainly to the above-named physiologists that we owe our recently acquired knowledge, it deserves mention that previous investigations undertaken on different but allied subjects by other physiological chemists, as, for example, Dr Edward Smith, Lawes and Gilbert, Playfair, and Haughton, are entirely in accordance with our views.

MUSES, in the Classic Mythology, divinities originally included amongst the Nymphs, but afterwards regarded as quite distinct from them. To them was ascribed the power of inspiring song, and poets and musicians were therefore regarded as their pupils and favorites. They were at first honored amongst the Thracians, and as Pieria around Olympus was the original seat of that people, it came to be considered as the native country of the Muses, who were therefore called *Pierides*. In the earliest period their number was three, though Homer sometimes speaks of a single muse, and once, at least, alludes to nine. This last is the number given by Hesiod in his "Theogony," who also mentions their names—Clio (q. v.), Euterpe (q. v.), Thalia (q. v.), Melpomene (q. v.), Terpsichore (q. v.), Erato, Polyhymnia (q. v.), Urania (q. v.), and Calliope (q. v.). Their origin is differently given, but the most widely-spread account represented them as the daughters of Zeus and Mnemosyne. Homer speaks of them as the goddesses of song, and as dwelling on the summit of Olympus. They are also often represented as the companions of Apollo, and as singing while played upon the lyre at the banquets of the Immortals. Various legends ascribed to them victories in musical competitions, particularly over the Sirens (q. v.). In the later classic times, particular provinces were assigned to them in connection with different departments of literature, science, and the fine arts; but the invocations addressed to them appear to have been, as in the case of modern writers, merely formal imitations of the early poets. Their worship amongst the Romans was a mere imitation of the Greeks, and never became truly national or popular. Among the places sacred to them were the wells of Aganippe and Hippocrene on Mount Helicon, and the Castalian spring on Mount Parnassus.

MUSEUM (Gr. *mouseton*), originally the name given by the ancients to a temple of the Muses, and afterwards to a building devoted to science, learning, and the fine arts. The first museum of this kind was the celebrated Alexandrian Museum (see ACADEMY). After the revival of learning in Europe, the term museum was sometimes applied to the apartment in which any kind of philosophical apparatus was kept and used; but it has long been almost exclusively appropriated to collections of the monuments of antiquity and of other things interesting to the scholar and man of science. In this sense it began to be first used in Italy, and probably in the case of the famous Florentine Museum, founded by Cosmo de Medici, which soon became a great and most valuable collection of antiquities. Nothing analogous to the museums of modern times existed amongst the ancients, the greatest collections of statues and paintings which were made in the houses of wealthy Romans having been intended for splendor rather than for the promotion of art. The name soon ceased to be limited to collections of antiquities, and sculptures, and paintings; collections illustrative of natural history and other sciences now form a chief part of the treasures of many of the greatest museums, and there are museums devoted to particular branches of science. Of the museums of Britain, the British Museum (q. v.) is the greatest; that of Oxford, founded in 1679, is the oldest.—The museum of the Vatican, in Rome, contains immense treasures in sculptures and paintings, and also in books and manuscripts.—The museum of the Louvre in Paris, that of St Petersburg, and those of Dresden, Vienna, Munich, and Berlin, are amongst the greatest in the world. The usefulness of a museum depends not merely upon the amount of its treasures, but, perhaps, even in a greater degree upon their proper arrangement; and whilst great collections in the chief capitals of the world are of incalculable importance to science, its interests are also likely to be much promoted by those local museums, still unhappily not numerous, which are devoted to the illustration of all that belongs to particular and limited districts. Museums appropriated to the illustration of the industrial arts—their raw material, their machines,

Mushroom  
Mus.c

340

and their products—and of everything economically valuable, are of recent origin, but their importance is unquestionably very great. Pre-eminent among institutions of this kind in Britain are the South Kensington Museum in London, and the Museum of Science and Art in Edinburgh.

MU'SHROOM, or Agaric (*Agaricus*), a genus of fungi, of the suborder *Hymenomyces*, having a *hymenium* of unequal plates or gills on the lower side of the *pileus*. The species are very numerous. Many of them are poisonous, many are edible, and some are among the most esteemed fungi. The species most esteemed in Britain is the Common M. (*A. campestris*), a native also of most of the temperate regions both of the northern and of the southern hemisphere, and of which a very large and fine variety occurs in Eastern Australia. It is found during summer and autumn (but chiefly in autumn) in pastures, orchards, vineyards, &c. Its *pileus* is regularly convex, becoming almost flat when old; fleshy, dry, white with a tinge of yellow or brown; of a silky smoothness on the upper surface, or somewhat scaly, but never warty; thickly set on the under side with very unequal gills, which in a young state are pink, and afterwards become dark brown. The *pileus* is attached by its centre to the top of the stem. The stem is of a firm fleshy texture, and towards the top is surrounded by a more or less distinct white membranous ring, the remains of the curtain or veil (*inductum*), which in a young state extends to the *pileus*, and covers the gills. This M. is gathered for the table when young, being preferred when the veil is still unbroken, and the unexpanded *pileus* has the form of a ball or button; but both in this state, and afterwards, whilst it shews no symptoms of decay, it is used for making Ketchup (q. v.). It has a very pleasant smell and taste, and the flesh, when bruised, assumes a reddish-brown color.—Very similar to it, and often sold instead of it in London and elsewhere, but rejected by all skillful housekeepers as unfit even for making ketchup, is the St GEORGE'S AGARIC (*A. Georgii*), sometimes called *whitecaps*, frequent in moist pastures and near buildings in all parts of Britain. This species is easily distinguished by its larger size—the *pileus* being sometimes 18 inches broad—its coarser appearance, its rather disagreeable smell, the yellow color which its flesh assumes when bruised, and the lighter color of its gills.—Care must be taken not to confound the Common M. with the white variety of *Agaricus phalloides*, a species not uncommon in Britain, chiefly in woods and on the borders of woods, which is very poisonous. Perhaps it is the possibility of this mistake which has led to the prohibition of the Common M. in Rome, where many kinds of excellent fungi are brought in great abundance to the market, and where a special officer superintends the sale of them. *A. phalloides* is, however, easily distinguished by the ring at the bottom of the stem, the white color of the gills, the warts on the upper surface of the *pileus*, and the powerful smell, which becomes extremely disagreeable as the M. grows old.—Another species of M. much in use for the table is the FAIRY-RING M. (*A. oreades*), sometimes called *Scotch Bonnets*—the *Champignon* of the French. It is common in pastures in Britain and most parts of Europe, often forming Fairy Rings (q. v.). It is much smaller than the Common M., the *pileus* being seldom more than an inch broad, the stem taller in proportion. The stem is solid, fibrous, and tough, with no ring; the *pileus* smooth, fleshy, tough, convex, with a more or less distinct boss (*umbo*) in the centre, of a watery-brown color, the flesh white. The odor is strong, but agreeable. This M. is used for ketchup, and is also dried and powdered for use at table as a savory addition to sauces and stews. It is constantly brought to market in England. It is liable, however, to be confounded with several poisonous species; but only one of them, *A. dealbatus*, forms fairy rings, and this may be readily distinguished by its disagreeable odor, by its becoming grayish-brown in zones when soaked in water, by the margin of the *pileus* being at first rolled inwards, and by its very fine dingy whitish gills.—The other edible species of M. or agaric are numerous, but they are chiefly used on the continent of Europe, and scarcely at all in Britain, although some of them are common British plants.—The ORANGE-MILKED AGARIC (*A. deliciosus*), which grows chiefly in fir-woods and among junipers, has a viscid *pileus*, four inches or more broad, at first orange, afterwards pale, the gills and juice orange, the gills running down the stem, the smell and taste agreeable.—The MORELLOON (*A. prunellus*) is common in woods and pastures, particularly on sandy soils. It has a *pileus* about 2–4 inches broad, convex, yellowish-white when young, the gills

at first white, and afterwards flesh-colored. The odor is agreeable. It is much esteemed on the continent as an article of food.—The *PARASOL AGARIC* (*A. procerus*) is found in pastures, especially under trees. It loves sandy soils. It is remarkable for its long stem, 8–12 inches high, with a thick spongy ring. The pileus is 3–7 inches broad, at first obtusely conic, then bell-shaped, covered with brown scales. The taste and smell are pleasant.—The *WHITE FIELD AGARIC* (*A. virgineus*) is one of the most common of British species, growing in pastures, with viscid or satiny white or whitish convex pileus, fully an inch broad, stem nearly two inches long, and light chocolate-colored distant gills, which run down the stem. It grows either singly or in groups.—The *ANISE M.*, or *SWEET-SCENTED AGARIC* (*A. odorus*), grows in shady woods and dells among moss and decaying leaves. It has a slightly convex pileus, about three inches broad, with pale gills. The odor is like that of anise.—The *IVORY M.* (*A. eburneus*) is found in woods, with pileus 2–3 inches broad, of a grayish-yellow color, broad gills, and a rather long and somewhat scaly stem.—The *SMOXY M.* (*A. fumosus*), with pileus smoke-gray above, the gills and stalk yellowish, is common in fir-woods.—All these are edible, and more or less pleasant and nutritious. Finer than most of them is the *IMPERIAL M.* (*A. cæsaricus*), the *Kaiserling* of the Germans, a species found in loamy soils in some parts of Europe, with orange pileus and lighter yellow stem and gills; but, unhappily, it is apt to be confounded with the very poisonous *Amanita* (q. v.) *muscaria*.

The *COMMON M.* is frequently cultivated both in the open garden and in houses or sheds. To grow it in the open garden, beds are prepared, generally of earth mixed with horse-dung, partly fresh and partly from old hotbeds, and are raised into ridges almost as high as broad. To grow it in houses, boxes are filled with alternate layers of half-rotten horse-dung and of straw, with a surface layer of fine mould. But of each of these methods there are many different modifications, none of which can here be detailed. In both, the production of mushrooms is sometimes left to the chance—often almost of a certainty—of spawn (*mycelium*) or spores existing in the dung or earth; sometimes, to increase the probability of a speedy and abundant crop, earth is introduced into the bed or box from a pasture known to be rich in mushrooms, and *M. spawn* is also frequently planted, which is either collected where mushrooms grow, or produced by artificial means, often appearing and being propagated extensively without the development of the *M. itself*. The almost certain production of *M. spawn* in heaps of slightly-fermenting horse-dung, straw, and earth, has been often urged as an argument in favor of the equivocal generation of fungi, but the minuteness and multitude of the spores may more reasonably be urged on the opposite side.

**MUSIC** (Gr. *mousiké*, from *mousa*, muse; Lat. *musica*), a combination or succession of sounds having the property of *pitch*, so arranged as to please the ear. The pleasure derived from music arises from its exciting agreeable sensations, and raising pleasing mental images and emotions. Apart from words, it expresses passion and sentiment, and linked to words, it loses its vagueness, and becomes a beautiful illustration of language.

The doctrine of musical sounds is based on the principles of *Acoustics* (q. v.). Sound is conveyed through elastic media by waves, not of alternate elevation and depression, but of alternate condensation and rarefaction, in which it is the form, the condition of the groups of particles that progresses, not each individual particle. When a series of vibrations recur on the ear at precisely equal intervals of time, following each other so closely that each cannot be separately distinguished, the result is a musical sound or note. The sound ceases to have a musical character when each pulsation is individually audible, as is the case when there are fewer than about sixteen beats in a second. The gravity or sharpness of the sound is called its *pitch*, and depends on the number of vibrations in a given time. A succession or progression of musical sounds following each other constitutes *melody*; the difference in pitch between any two of them is called an *interval*. Where two or more musical sounds, whose relative pitch is properly proportioned, are heard simultaneously, the result is a *chord*, and a succession of chords constitutes *harmony*.

When a vibration is communicated to a string stretched between two points, the result is a musical note, whose pitch is dependent on the length of the string and the degree of tension applied to it; the shorter the string, and the greater the tension, the higher is the pitch. If the string be divided in the middle, the tension re-

maintaining the same, the note produced is twice as high in pitch, and is called the octave to the note produced by the whole string. Every vibration of the one corresponds to two of the other, and there is between a note and its octave a far closer relation than between any two other notes; they go together almost as one sound, and are considered to a great extent as one musical sound. In the diatonic scale, familiar to every correct ear, there are six notes, bearing certain harmonic relations to the fundamental note, interposed between it and its octave; and as we ascend, the notes arrange themselves in similar successions of sevens, each set an octave higher, or double the pitch of that which preceded it. The seven notes are designated by the names of the first seven letters of the alphabet, the same letter being used for any note and its octave. For another notation also in use, see *SOLMISATION*. Taking C for the fundamental note, we have for our scale

C D E F G A B C D E F G A B C, &c.

The scale may be extended up or down indefinitely, so long as the sounds obtained continue to be musical. The satisfaction and sense of completeness which the diatonic scale gives the ear, arise from its being founded on correct harmonic principles. The quality called harmony is produced by a coincidence of vibrations: notes are more harmonious the oftener their waves coincide. Besides the octave, two of whose waves coincide with one of the fundamental, there are other intervals harmonious, though in a less degree. Dividing our string into three parts instead of two, we have a note higher than the octave, which may be lowered by an octave by making the string two-thirds of the original length, and produces a wave of which three coincide with two of the fundamental. Next to the octave, this note stands in the most intimate relation to the fundamental; it is called the dominant. Dividing the string by five, and lowering the note two octaves, another harmonic is got, called the mediant. In contradistinction from both these, the fundamental note (or any of its octaves) is called the tonic or key-note. C being taken as the key-note, E is the mediant, and G the dominant. These three notes, when struck simultaneously, form the harmonic triad, and stand to each other in the relation of 1, 5-4, 3-2 (numbers indicating the number of vibrations, which are inversely as the length of the string) or, reducing fractions to integers, in the relation of 4, 5, 6. When a musical string is vibrating, these sounds are heard on close observation more or less distinctly vibrating along with it, the cause being a spontaneous division of the string into aliquot parts, producing subordinate vibrations simultaneously with the principal vibrations. But the dominant may in its turn be the tonic from which another triad of tonic, mediant, and dominant is taken, forming a scale of triads extending indefinitely up and down, and it is from three such adjacent triads that the diatonic scale originates. Its elements are the triad of the tonic united with the triads which stand in the most intimate relation to it—viz., those immediately above and below it—

F A C, C E G, G B D.

F is the note whose dominant is C (the tonic), and therefore, in respect of C, it is called the subdominant. A is the mediant of the subdominant F, and therefore called the submediant. D is the dominant of the dominant, and is called the super-tonic. B, the mediant of the dominant, is called the leading note. We have seen that the notes of each triad stand to each other in the relation of 4, 5, 6. Preserving this proportion, and multiplying to avoid fractions, we have

F A C E G B D  
as 16, 20, 24, 30, 36, 45, 54

We must multiply F and A by 2, and divide D by 2, to bring them within the compass of an octave, and then we have

C D E F G A B C  
as 24, 27, 30, 32, 36, 40, 45, 48

These are the degrees of the Diatonic Scale, which are indicated by the white keys of the pianoforte, as in the following figure.

The interval CD is commonly called a second; CE, a third; CF, a fourth; CG, a fifth; CA, a sixth; and CB, a seventh; CC being, as already seen, an eighth or octave—names corresponding to the position of the notes on the key board or in the

diatonic scale, but having no relation to the proper proportional numbers already given. The intervals of the third, fifth, and sixth (counting from the key-note), owing to the more intimate harmonic relation of the notes between which they lie, afford more satisfaction to the ear than the others, or are, as it is called, the most perfectly consonant intervals. Intervals may be counted from any note as well as the tonic. *DE* is called a third as well as *CE*, although these intervals are unequal. We may have intervals beyond the octave: they are, however, substantially but repetitions of those below, *CD*, a ninth, being also, a second, and so on.

It is often desirable in the course of a musical composition to change the key-note, which involves the formation of a diatonic scale on some other note than *C*, in which case we are said to modulate from one key into another. As the intervals *CD*, *DE*, *EF*, &c., are by no means all equal, the notes which we have already got will not do for a scale founded on any other tonic than *C*. The ratios of the intervals in the diatonic scale, expressed in numbers by logarithms, are:

<i>C</i>	<i>D</i>	<i>E</i>	<i>F</i>	<i>G</i>	<i>A</i>	<i>B</i>	<i>C</i>
51	46	28	51	46	51	28	

At first sight it would appear that in keyed instruments there must be a separate row of keys for each tonic, but practically this is found not to be necessary. If *D* instead of *C* be taken as key-note, *E*, *G*, and *A* are some approach to the correct second, fourth, and fifth, but *F* and *C* are greatly too low in pitch for a proper third and seventh. With some notes taken as key-note, the correspondence is greater, with others it is less. The difficulty is overcome by a system of compromises called Temperament (q. v.). Roughly speaking, we have in the diatonic scale an alternation of two long intervals, a short interval, three long intervals, and a short interval. The long intervals 51 and 46 are styled tones, and the short interval 28 a semitone. Were the tones all equal, and the semitone exactly half a tone, a note interposed in the middle of each tone, dividing the seven intervals into twelve, would make it immaterial where the scale began. A system founded on this supposition is the remedy actually adopted in most keyed instruments, and the inaccuracy produced by this compromise is not sufficiently great to offend the ear.

The interposed notes indicated by the black keys of the pianoforte (see fig.), complete what is called the chromatic scale, consisting of twelve intervals approximately equal.

The notes of music are represented in ordinary notation on a series of five parallel lines, called the staff. On these lines, and in the four spaces between them, marks are placed indicating the notes, which are counted upwards, beginning with

the lowest line. Every line or space is called a degree, the staff consisting of nine degrees.

When more than nine notes are required, the spaces below and above the staff are used, and the scale is extended by means of short added lines, called *leger lines*. The pitch of the notes on the scale is determined by a figure called a clef, (*clavis*, a key), placed at the beginning of the staff on a particular note, from which all the others are counted. The clefs most in use are the bass, tenor, and treble clefs, represented on the notes F, C, and G respectively (see *CLEF*). The treble and bass clefs only are used in music for keyed instruments, and when a staff is required for each hand, they are joined together by a brace, the upper staff for the right hand, the lower for the left. The ascending scale in these clefs is as follows:

These notes correspond with the white keys of the pianoforte or the diatonic scale when C is key-note, no allowance being made for the black keys, which, as we have seen, divide the tones into semitones. Those semitones which do not occur with C as key-note are represented by the signs  $\sharp$  (sharp) and  $\flat$  (flat). The sign  $\sharp$ , prefixed to a note, elevates it a semitone in the scale, raising, for example, F to F sharp.  $\flat$  lowers the note by a semitone, depressing B to B flat. When a note which has been elevated by a sharp, or depressed by a flat, is to be restored to its original place, the character  $\natural$  (natural) is prefixed to it.

The names of the intervals correspond to the degrees of the staff, but it has been seen that intervals of the same name are not necessarily equal. If the sign of a flat or a sharp be prefixed to either note of an interval, it still preserves its name of a third, a fifth, &c.; but to distinguish intervals of the same degree, the qualifying epithets of major and minor, augmented and diminished, are used.

The different keys in music are best understood by reverting to the scale of triads, on which the diatonic scale is founded. Taking a series of triads, of which the dominant of each is the key-note of the next, we obtain the following scale, extended both upwards and downwards from C:

Each triad is composed of the key-note, its mediant, and dominant, and the scale of each key is composed of the triad of the key-note, with the triad immediately preceding and that immediately following it. Each key is succeeded by the key of its dominant, and if we begin with the key of C (in the middle of the scale), each key acquires an additional sharp till we reach the key of F $\sharp$  with six sharps. These are the sharp keys. If, beginning again with the key of C, we go back instead of forward in the scale of triads, we obtain the flat keys; each key has an additional flat to that above it, till we come down to the key of C $\flat$  with six flats. This key in instruments with temperament is exactly the same with that of F $\sharp$ , and on this account it is not generally found convenient to extend the keys beyond six, or at most seven, sharps or flats. G $\sharp$  with seven sharps is the same as D $\flat$  with five flats, and C $\flat$  with seven flats is the same as B with five sharps. In music written in these keys, double sharps and double flats occur, which are indicated by the characters  $\times$  and  $\flat\flat$  respectively. In writing music in any key with sharps or flats, it is usual, instead of prefixing the sharp or flat to each note when required, to place the sharps and flats belonging to the key together after the clef, on the degree to which they belong, and such collections of sharps or flats are called the signature.

## SIGNATURES OF THE SHARP KEYS.

## SIGNATURES OF THE FLAT KEYS.

A sharp or flat introduced in a composition which does not appear in the signature, is prefixed to the note, and called an accidental.

The diatonic scale and keys above described belong to what is called the major mode; there is also another mode in use called the minor mode. In the minor, as in the major mode, the diatonic scale and the keys are based on the scale of triads. Each of the triads already considered consists of two unequal intervals, called a major third and minor third. Supposing we begin with the minor instead of the major third, we have a succession of chords taking their minor third from one triad and their major third from another. These compound cords are called minor triads. Their proportion is as 10, 12, 15, and out of three such consecutive minor triads the scale of the minor mode is constructed.

D̂ F̂ Â Ĉ Ê Ĝ B̂  
80, 96, 120, 144, 160, 216, 270

Multiplying D and F by 2, and dividing B by 2, to bring the whole within the compass of an octave, we have:

A B C D E F G A  
120, 135, 144, 160, 180, 192, 216, 240.

The scale here represented is what is known as the descending scale of the minor mode. When the seventh of the scale ascends to the eighth, it becomes a sharp, as the proper leading note or sharp seventh to the tonic. This sharp is, however, always omitted from the signature, and placed accidentally before the seventh which it is to elevate. In order to avoid the harsh interval of the augmented second (from F to G#), it is usual in the ascending scale to make the sixth sharp also, in order to accommodate the seventh; thus the ascending or accidental scale of the minor mode has two notes altered from the signature.

Each minor scale is called the relative minor to the major scale on its right hand in the scale of triads, with which it has the same signature: thus the relative minor scale to C major is that of A minor.

C major      F̂ Â Ĉ Ê Ĝ B̂  
A minor      D̂ F̂ Â Ĉ Ê Ĝ B̂

Each minor scale is also called the tonic minor to the major scale on the same key note, from which it differs in flattening the third of its tonic, and in the descending

scale also the third of its subdominant and dominant. The tonic minor scale to C major is C minor.

C MAJOR.

C MINOR.

As the descending scale regulates the signature, each tonic minor has three flats more, or three sharps less in its signature than its tonic major.

F MAJOR.

F MINOR.

A MAJOR.

A MINOR.

G MAJOR.

G MINOR.

In this last example, F#, B#, and E# are all considered sharps in contrast with F, B, and E of the minor scale.

**Rhythm.**—In musical notation, the relative duration of notes is indicated by their form. Notes may be open or close; they may consist of a head only, or of a head and stem. Where there is a stem, it may be turned up or down, according to convenience. The semibreve, the longest note in ordinary music, is open, and consists of a head only (♩). The minim is an open note with a stem, half the length of a semibreve (♩); the crotchet is a close note with a stem, half the length of a minim (♩); the quaver is a close note with a stem and hook, half the length of a crotchet (♩); a quaver is further divided into two semiquavers with two hooks (♩);

four demi-semiquavers with three hooks (♩); and eight semi-demi-semiquavers with

four hooks (♩). In slow religious music, an open square note, called a breve (♩),

sometimes occurs. The semibreve is equivalent in time to two minims, four crotchets, eight quavers, sixteen semiquavers, thirty-two demi-semiquavers, and sixty-four semi-demi-semiquavers. The notes formed with hooks may be grouped

together

. In vocal music this is not done except

when a group is to be sung to one syllable. When a dot is placed after a note  $\text{P} \cdot$  it is lengthened by one-half; when two dots,  $\text{P} \cdot \cdot$  it is lengthened by three-fourths.

Every piece of music is divided into portions equal in time, called measures, which are separated from each other by vertical lines called bars. The term bar is often loosely used to denote the measure as well as the line. The exact length of the measure is indicated by a sign at the beginning of the movement. In common

time, indicated by the sign  each measure includes a semibreve, or its equivalent

made up in notes of lower value:  All

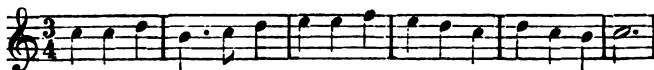

other measures of time have for their signatures two figures placed as a fraction, one over the other. The figures of the denominator are either 2, 4, 8, or 16, which stand for minims, crotchets, quavers, and semiquavers respectively (i. e., halves, fourths, &c. of a semibreve); the numerator indicates the number of these fractional parts of a semibreve contained in each measure. There is another form of common time besides that already noticed, which is called half-time, has a minim or

two crotchets in the measure, and is known by the signature  i. e., two

crotchets— 

When there are three minims, crotchets, or quivers in a measure, the piece is said to

be in triple time, its signature being   or .

When two or more measures of triple time are united in one measure, the movement is said to be in compound common time. Its usual forms are indicated by

the signatures  and . In the first, there are three submeasures of three

crotchets; in the second, two submeasures of three quavers—

Compound triple time occurs where there are nine notes in a measure, either crotchets, quavers, or semiquavers, grouped in three. Its signatures are—

A variety occasionally occurs in simple or triple time

by the measure note being divided into three, or even five or seven, instead of two parts, which are grouped together, sometimes with the figure 3, 5, or 7, placed

The object of the division of musical passages into measures is to indicate their rhythm, a quality forming an essential element in the pleasure derived from music. Notes of music, like words or syllables, are accented or unaccented. The principal accent is given to the first note of a measure. Of the four measure notes in common time, the third has also a subordinate accent, as has the third measure note in triple time. There are occasions when a strong accent, or emphasis as it is called, is laid on the part of the measure which is usually unaccented; this the composer indicates by the Italian terms *rinforzando*, *sforzato*, abbreviated *rinf.*, *sf.*

When in the course of a movement silence is required for a time, this is indicated by a rest or rests corresponding to that time; the breve, semibreve, minim, &c., have each their respective rests, which are represented as follows:—

Breve. Semibreve. Minim. Crotchet. Quaver. Semiquaver. Demi-semi. Semi-demi  
ver. quaver. semiquaver

A rest may, like a note, be dotted to indicate the addition of half to its length.

The double bar  consists of two strong vertical lines placed at the end of

a musical composition, and also at other parts (not necessarily coincident with the end of a measure) where a strain or rhetorical division of a movement terminates. When dotted on one side, all the measures on the side with the dots are to be repeated from the beginning, or from the antecedent double bar.

A tie is an arch placed between two notes on the same degree, to indicate that instead of the two notes written, one note is to be played of the length of both. When the last note of one measure is thus connected with the first of the next measure, the former, though naturally the unaccented note, acquires the emphasis—

When the same arch is drawn over two or more notes not in the same degree, it is

called a slur, and merely indicates that they are to be played smoothly or fluently

When notes are to be played short, distinct, and detached (*staccato*), a dot is placed over them. A dash implies a greater, and the union of dot and slur a less degree of *staccato*—

The pause  $\frown$  placed over a note indicates a delay in the time of the movement, and a continuance of the sound made on that part of the measure.

The various degrees of softness and loudness which occur in a piece of music are indicated by the letter *f* for *forte*, loud; *p* for *piano*, soft, also *pp* for *piu-sissimo*, very soft; *mf* for *mezzo forte*, rather loud, and *ff* for *fortissimo*, very loud. A gradual increase of loudness is denoted by the word *crescendo*, or the sign  $<$ ; and a diminution from loud to soft by the word *diminuendo*, or the contrary sign  $>$ . Many other expressions are used in the body of written music, indicating slowness, quickness, and the character of execution. The most important of them are explained under separate articles—as are the various musical graces or embellishments known under the names of the *Appogiatura*, *Beat*, *Shake*, and *Turn*. Among abbreviations in frequent use are a line drawn over or under a semibreve, or through the stem of a minim or crotchet, to divide it into quavers; or a double line, to divide it into semiquavers. Two minims may be connected to indicate their repetition as quavers. Thus—

Written.

Played.

**Harmony.**—We have mentioned that when a string is struck, its harmonics are more or less distinctly heard along with it. This arises from the string sponta-

neously dividing itself into aliquot parts—as one-half, one-third, one-fourth, one-fifth, one-sixth, one-seventh, &c., of the string. The numbers 2, 3, 4, 5, 6, 7, expres-

sing the relative number of vibrations in a given time, are a measure of the pitch of the note, and placed proportionally to one another, or in the form of a fraction, they are a measure of the interval. The prime numbers 2, 3, 5, and 7, and their compounds, constitute the harmonics of a musical sound; no division by a higher prime number is tolerable to the ear along with the fundamental note, and no sound corresponding to such division is audible in the vibrations of a string.

The degrees of the harmonic scale consist of intervals decreasing in a geometrical ratio from the octave to the minor tone, viz.—

1 : 2 Octave.	6 : 7 Grave third.
2 : 3 Fifth.	7 : 8 Tone maximus.
3 : 4 Fourth.	8 : 9 Tone major.
4 : 5 Major third.	9 : 10 Tone minor.
5 : 6 Minor third.	

Other intervals more or less consonant are to be found in the harmonic scale, of which the most important is 4 : 7, the grave seventh. From this scale is derived the triad, which we have seen to be the foundation of the diatonic scale, and also the whole theory of chords.

The first five notes of the harmonic scale are the component parts of the major common chord, by far the most consonant chord that can be produced by five notes. Neglecting octaves, its essential notes are the major triad, C E G, or 4, 5, 6, which, as already seen, consists of a fifth divided harmonically into major third and minor third. The root on which a chord is formed, or the note by whose division into aliquot parts the notes of the chord are produced, is called its fundamental bass, and the fundamental bass of the triad C E G is C. The common chord is the triad with the addition of the octave of the root; its proportions are 4, 5, 6, 8. Every key contains within itself two other triads besides that of the key-note—viz., those of the subdominant and dominant, which have the subdominant and dominant of the key-note respectively for their fundamental basses; and the feeling of satisfaction produced by the diatonic scale arises out of the fact, that its notes belong to a progression of chords formed on a fundamental bass suggested by the ear. This fundamental bass is here indicated on the lower staff—

The relative position of the notes of a chord, and consequently its intervals, may be altered by raising one or more of them an octave; and, on the whole, the nearer the intervals approach to their position in the harmonic scale, the purer is the harmony. Close, in contradistinction to dispersed harmony, is when the notes of a chord are so near that no component note could be placed between them. When the fundamental bass of a chord ceases to be its lowest note, the chord is said to be

inverted. Thus  and  are inversions of the common chord,

but not , where the fundamental bass is still the lowest note.

The minor triad is, as we have seen, a compound chord, whose ratio is 20, 24, 30, taking its minor third from the triad below, and its major third from the triad above. Its fundamental bass is the key-note. The minor mode has, like the major, three triads in each key—those of the tonic, subdominant, and dominant; and the minor common chord admits of the same inversions as the major, by making the third or fifth the lowest note.

The first seven notes of the harmonic scale contain the chord next in consonance to the common chord, the chord of the seventh or dominant harmony. Rejecting octaves, it is the harmonic triad with the addition of the grave seventh, 4, 5, 6, 7, C E G B $\flat$ , or G B D F, and admits of three inversions, according as the third, fifth, or seventh is taken instead of the root as the lowest note. This chord belongs to the key of which its fundamental note is the dominant; and in order to satisfy the ear, it requires to be followed by a resolution into the common chord of the key, or one of its inversions, the major third rising a semi-tone to the key-note, and the seventh descending one degree—

The dominant seventh note is flatter by an interval of 63, 64 than the subdominant of the key, though the two are not distinguishable on keyed instruments. The chord of the dominant seventh is the same in the tonic minor as in the major mode, but differs in its resolution, in respect that it descends a tone instead of a semitone

The dominant harmony affords numerous means of modulating from one key to another. For example, the addition of a dominant seventh, to the common chord of a key, effects a modulation into the key of the

sub-dominant. In modulating into the key of the dominant, the supertonic bears the dominant harmony, and becomes dominant of

the new key. For other modulations we must refer to

works on the theory of music.

The following more complex harmonies are also in general use—

1, the chord of the added ninth, consisting of the dominant harmony (its root generally omitted) with the fifth of the adjacent triad above. 2, 3, and 4, the different forms of the added sixth, or chord of the subdominant. 2 is the triad of the subdominant, with the third of the adjacent triad below, or rather its octave; 3 is

the triad of the subdominant, minor mode, with the third of the adjacent triad below; and 4, the same triad with the third of the tonic major to the adjacent triad below. 5, the diminished seventh, a compound of the characteristic notes (B F) of the dominant harmony of the major mode with those (G ♯ D) of the relative minor. 6, 7, and 8, the augmented sixths, all dominant harmonies, resolving into the major tonic. 6, called the Italian sixth (F A D♯), is a compound of the characteristic notes (A D♯) of the dominant harmony of the minor mode (B D♯ F A) inverted, with the dominant seventh note (F) of the major triad (C E G) below for a bass; 7, the French sixth (F A B D♯), the same as the last, with the addition of the octave to the fundamental bass; 8, the German sixth (F A C D♯), compounded of the characteristic notes of the dominant harmony of the minor mode inverted, with the dominant seventh of the major triads below and above.

All classical harmonies can be reduced to the chords enumerated, varied by inversions, omissions, suspensions, and pedal bases. A pedal bass or organ-point is a base note sustained through a progression of chords, to only the first and last of which it is the proper bass. The pedal bass of the tonic is often used with the chord of the dominant seventh, the added ninth, and the diminished seventh, and occasionally with other chords: sometimes the pedal harmonies are taken on the dominant instead of the tonic, and the holding note sometimes occupies an upper part instead of the base—

A musical composition consists of a succession of notes or of chords subject to certain laws. Like discourse, music has its phrases, periods and punctuation. When a piece of music continues in the same key, it is said to move by progression, a term used in contradistinction to modulation, where the key is changed. Progression in music of two parts is of three kinds—oblique, when one part repeats or holds on the same note, while the other moves up and down; direct, where both parts move in the same way; and contrary, where one moves up, and the other down. Consecutive chords should in general be connected, either as having some note in common, or as being the chords of closely connected keys. There are certain chords which require a special resolution—i. e., they must be followed by certain other chords; and there are certain progressions which, from harshness, are in ordinary cases to be avoided, more particularly consecutive fifths, and consecutive octaves, the latter, however, being admissible when used merely to strengthen a part. Modulation is generally effected by introducing the chords common to both keys, and the secret of good modulation consists in the skillful choice of intermediate chords. Every regular piece of music is composed in a particular key, in which it begins and ends, and which predominates over all the other keys into which it has modulated. The keys into which a key most readily modulates, are those most nearly related to

It—viz., the dominant, the subdominant, and the relative and tonic major or minor. We have seen how modulation may take place by introducing the dominant harmony of the new key or one of its inversions, and in this way the entire harmonic circle of the keys can be made, either by ascending or descending fifths; but in order to effect this change, it will be necessary, on reaching the key of *C*, with seven sharps, to substitute, by what is called an *Enharmonic* (q. v.) change, *D*, with five flats, or *vice versa*, which on instruments with temperament produces no real change on the pitch, but merely on the names of the notes.

The arrangement of chords which the ear naturally expects at the close of a strain is called a cadence; it corresponds in music to the period which closes a sentence in discourse. It is perfect when the harmony of the dominant precedes the harmony of the key-note, and imperfect when the harmony of the key-note precedes that of the dominant without its seventh.

The imperfect cadence is the most usual termination of a musical phrase, or short succession of measures containing no perfect musical idea. A portion of melody formed of two regular phrases, and containing a perfect musical idea, is called a section, and its regular termination is the perfect cadence.

Perfect.

Imperfect.

Music is produced by the human voice, and by a variety of artificial instruments. For the application of the voice to musical purposes, see *SINGING*. Musical instruments are classified as stringed instruments, wind instruments, and instruments of percussion. In some stringed instruments, as the pianoforte, the sounds are produced by striking the strings by keys; in others, as the harp and guitar, by drawing them from the position of rest. In a third class, including the violin, viola, violoncello, and double bass, the strings are put into vibration with a bow. In wind instruments, the sound is produced by the agitation of an enclosed column of air; some, as the flute, clarionet, oboe, bassoon, flageolet—instruments of wood, and the trumpet, horn, cornet-a-piston, &c., of metal, are played by the breath; in others, as the organ, harmonium, and concertina, the wind is produced by other means. In the two last-named instruments, the sound is produced by the action of wind on free vibrating springs or reeds. Instruments of percussion are such as the drum, kettle-drum, cymbals, &c. The chief peculiarities of the more important musical instruments are noticed in special articles.

Musical compositions are either for the voice, with or without instrumental accompaniment, or for instruments only. Of vocal music, the principal forms may be classed as church music, chamber music, dramatic music, and popular or national music. The first includes plain song, faux-bourdon, the chorale, the anthem, the sacred cantata, the mass and requiem of the Roman Catholic Church, and the oratorio. Vocal chamber music includes cantatas, madrigals, and their modern successors, glees, as also recitatives, arias, duets, trios, quartets, choruses, and generally all forms, accompanied or unaccompanied, which are chiefly intended for small circles. Dramatic music comprehends music united with scenic representation in a variety of ways, in the ballet, the melodrama, the vaudeville, and the opera, in which last, music supplies the place of spoken dialogue. Instrumental music may be composed for one or for more instruments. The rondo, the concerto, the sonata, and the fantasia generally belong to the former class; to the latter, symphonies and overtures for an orchestra, and instrumental chamber music, including duets, trios, quartets, and other compositions for several instruments, where each takes the lead in turn, the other parts being accompaniments. These and other forms of composition will be found noticed separately.

*History of Music.*—A certain sort of music seems to have existed in all countries and at all times. Even instrumental music is of a very early date: representations of musical instruments occur on the Egyptian obelisks and tombs. The music of the Hebrews is supposed to have had a defined rhythm and melody. The Greeks numbered music among the sciences, and studied the mathematical proportions of sounds. Their music, however, was but poetry sung, a sort of musical recitation or intoning, in which the melodic part was a mere accessory. The Romans borrowed their music from the Etruscans and Greeks, and had both stringed instruments and wind instruments.

The music of modern Europe is a new art, with which nothing analogous seems to have existed among the nations of antiquity. The early music of the Christian Church was probably in part of Greek, and in part of Hebrew origin. The chorale was at first sung in octaves and unisons. St Ambrose and Gregory the Great directed their attention to its improvement, and under them some sort of harmony or counterpoint seems to have found its way into the service of the church. Further advances were made by Guido of Arezzo, to whom notation by lines and spaces is due, but the ecclesiastical music had still an uncertain tonality and an uncertain rhythm. Franco of Cologne, in the 13th c., first indicated the duration of notes by diversity of form. The invention of the organ, and its use in accompanying the chorale, had a large share in the development of harmony. Along with the music of the church, and independently of it, a secular music was making gradual advances, guided more by the ear than by science; it seems to have had a more decided rhythm, though not indicated as yet by bars. The airs which have become national in different countries were developments of it, but it had its chief seat in Belgic Gaul; and the reconciliation of musical science with musical art began in Flanders by Josquin Despré in the 15th c., was completed in the 17th c. by Palestrina and his school at Rome, and reacted eventually on the ecclesiastical style. The opera, which appeared nearly contemporaneously with the Reformation and revival of letters, greatly enlarged the domain of music. Italy advanced in melody, and Germany in harmony. Instrumental music occupied a more and more prominent place. Corelli's compositions exalted the violin. Lulli and Rameau, with their ballet-like music, seized the characteristics of French taste, till the German Gluck drove them out of the field. The scientific and majestic fugue reached its highest perfection under J. S. Bach. The changes introduced in ecclesiastical music in England at the Restoration gave birth to the school of Purcell; and a little later, England adopted the German Handel, who was the precursor of Haydn, Mozart, Beethoven, Spohr, and Mendelssohn. The principal fact in recent musical history is the movement with which the name of Wagner is connected, having for its aim the production and perfection of a true musical drama, in which, unlike the opera, the words and music shall be of equal importance.

See Pepusch's "Treatise on Harmony," Calcott's "Musical Grammar," Hawkins' and Burney's "History of Music," Marx's "Allgemeine Schule der Musik," Brown's "Elements of Musical Science," and Chambers's "Information for the People," Nos. 96-97 (1875).

**MUSIC RECORDER.** Many forms of apparatus have been invented for writing down music in a legible form by the very act of playing it on a keyed instrument, such as the pianoforte or organ. Beginning with 1747, various attempts had been made to effect this object, when, in 1863, Mr Fenby invented and patented his *Phonograph*, in which he brought in the aid of electro-magnetism. His chief aim, as an improvement on previous apparatus, was to devise a method of denoting the length of the notes, as well as their pitch and the interval between them. On pressing down any key of the instrument, a stud on the under side touches a spring; the spring sets in action a small electro-magnetic apparatus, which causes a tracer to pass against a strip of paper moving onward at a uniform rate by means of a cylinder and clockwork. The paper is chemically prepared, so as to receive a brown stain whenever the tracer passes along its surface. The length of each note is expressed by horizontal dashes of greater or less length, made by the tracer; and the arrangement is such as to denote the lines of the staff as well as the character of the note. By subsidiary adjustments, the apparatus is made to express accidental sharps and flats, changes of time, &c.

The Abbé Moigno's *Phonautograph*, introduced to the British Association in

1660, is a contrivance—not for noting down sounds in any kind of musical notation—but for causing a vibrating surface to tell its number and character of vibrations. A kind of spheroidal drum is covered at one end with a diaphragm or stretched membrane; a sheet of paper is carried along this drum-head by means of clock-work; and a system of small levers moves a pen. A tuning-fork, an organ-pipe, or the voice is sounded in proximity to the drum, the body of air within which acts as a reinforcement of the sound; the membrane vibrates in a manner which can be felt by the pen, although not seen by the eye; and the pen makes zigzag markings on the paper. When the sound is produced by a tuning-fork or an organ-pipe, the zigzag lines are so regular that they serve to count the number of vibrations belonging to each particular note. When the sound is that of a singing voice, the markings become very peculiar, especially in such words as contain the gutturals *r, g, &c.*

MUSK, or Musk Deer (*Moschus moschatus*), a ruminant quadruped, the type of the family *Moschidae*. This family differs from *Cervidae* (Deer) in the want of horns, and in the long caudines of the males, projecting beyond the lips. The *M.* is an inhabitant of the elevated mountainous regions and table-lands of Central Asia. The habits of the *M.* are very similar to those of the Chamois. Its favorite haunts are the tops of pine-covered mountains, but its summer range extends far above the region of pines. Its habits are nocturnal and solitary, and it is extremely timid. It is much pursued by hunters on account of its odoriferous secretion, which has been known in Europe since the 8th c., and is much valued as a perfume. This secretion, *musk*, is produced in a glandular pouch situated in the hinder part of the abdomen of the males; and its natural use seems to be that of increasing sexual attractiveness. The musk-bag is formed by an unfolding of a portion of the skin of the belly, within which a number of membranes are contained, and between these membranes are glands by which the musk is secreted. When newly taken from the animal, musk is soft and almost resembles an ointment; it is reddish-brown, and has an excessively powerful odor. Very little of it reaches Europe unadulterated.—Musk is usually imported either in the form of *grain-musk*, that is, the musk which has been collected chiefly from stones upon which it has been deposited by the animal, in which state it is a coarse powder of a dark-brown color; or in the *pod*, that is, in the musk-sac, which is cut altogether from the animal, and dried with the musk inside. Of both kinds the annual importations are about 15,000 ounces per annum, chiefly from China and India. Small quantities are used in medicine, but the greater portion is employed by the perfumers. It is imported in small boxes or caddies, often covered with bright-colored silk, and each containing 25 pods. The kinds generally known in trade are the Tonquin or Chinese, which is worth two guineas an ounce in the pod, or £8. 10s. per ounce in grain; and the Cabardine, Kabardine, or Siberian, which is always imported in pod, and is very inferior, being only worth about 15s. an ounce.

The flesh of the *M.* is sometimes eaten, but has a very strong flavor. The season of migration from the highest and coldest to more temperate regions, is that at which the *M.* is chiefly pursued.—No other animal of the family *Moschidae* yields the perfume called musk, or has more than a rudimentary musk-bag. The other species of *Moschidae* belong to the genus *Tragulus*, and receive the popular name *Cheevrotains*. They have a very elongated muzzle; and the accessory hoofs assume the form of oppressed conical claws. They inhabit the thick woody copses or jungles of the Indian islands, and are the smallest of ruminant quadrupeds. Some of them are not larger than a hare. Their tusks are not so long as those of the Musk. One of them, the *Napu* of Java and Sumatra, has the smallest blood corpuscles of any known animal.

MUSK DUCK (*Cairina moschata*), a species of duck, of the non-oceanic section of *Anatides* (see DUCK); of a genus characterised by an elevated tubercle at the base of the bill, the edges of the mandibles sinuated, the face and lores covered with a bare tuberculated skin, the wings furnished with a knob or spur at the bend. The *M. D.*, or MUSCOVY DUCK—so called, however, through mistake, and receiving its name *M. D.* more appropriately from its musky smell—is a native of the warm parts of America. It is very plentiful in Guiana, in that part of the year when winter reigns in the north. It is a larger bird than the common duck, in its wild state

almost black, with glosses of blue and green, and white wing-coverts, but varies considerably in domestication. It is often to be seen in poultry-yards in Britain, but is rather curious than profitable. It hybridises readily with the common duck, but the hybrid is sterile.—The M. D. of Australia is a very different species belonging to the genus *Biziura*.

**MUSK OX** (*Bos moschatus*, or *Ovibos moschatus*), an animal of the family *Bovidae*, regarded as a connecting-link between oxen and sheep. It inhabits the most northern parts of America, enduring the winter even of Melville Island and Banks' Land; but, like many other animals, it is partially migratory, some individuals or herds seeking more southern regions and better pastures on the approach of winter, whilst some remain in the furthest north. It is not found in Greenland, Spitzbergen, or Siberia. The M. O. is scarcely equal in size to the smallest of Highland cattle, but appears larger from the profusion of long matted woollen hair with which it is covered, and which hangs almost to the ground. The head is covered with long hair as well as the body, the face alone having short hair. Beneath the long hair there is a thick coat of exquisitely fine wool. The head is large and broad; the forehead convex; the extremity of the muzzle hairy. The horns are very broad at the base, and in the male meet on the forehead; they do not rise but bend down on each side of the head, and curve onwards and upwards towards the tip, which tapers to a sharp point. They are about two feet long measured along the curvature; and about two feet in girth at the base; a pair of them sometimes weighing sixty pounds. The limbs are short, the legs have short hair. The tail is very short, and is covered with long hair, so that it is undistinguishable to the sight. The general color is brown. The female is smaller than the male, has shorter hair on the chest and throat, and smaller horns. The frog of the hoof is short, and partially covered with hair; the foot-marks are very similar to those of the reindeer.

The M. O. feeds on grass, twigs, lichens, &c. It is fleet and active, very sure-footed on rocky ground, and ascends or descends very steep hills with great ease. It is gregarious; the herds generally number thirty or forty. The powerful horns are excellent weapons of defence against wolves and bears, which are often not only repelled but killed. When musk oxen are assailed by firearms, however, they generally huddle more and more closely together, and do not even seek safety by flight, so long as the assailants are unseen. The flesh is much prized by the Esquimaux, but retains much of the strong musky odor which characterises the living animal. The horns are used for various purposes; particularly the wide base for vessels. The fine wool has been spun and woven into a fabric softer than silk. No attempt has yet been made to domesticate the M. O.; which, however, seems worthy of it, and suitable for all cold regions.

**MUSK PLANT**, Musk Root, Musk Tree, Musk Wood. Different parts of a number of plants smell more or less strongly of musk. Among these are the common little Musk Plant (see *MIMULUS*), the Musk-tree of Van Diemen's Land (see *ACACIA*), and the Musk Ochro (see *HIBISCUS*).—The musk-tree of Jamaica (*Moschazylon Swartzii*) belongs to the natural order *Meliaceæ*. It emits from all parts a smell of musk.—All parts of *Guarea grandifolia*, another tree of the same order, a native of the West Indies, sometimes called musk wood, also smells strongly of musk, but particularly the bark, which is used in perfumery.—The drug called **MUSK ROOT** or **SAMBUL** is brought from the East, and is the root of a plant supposed to be of the natural order *Umbelliferae*; but the plant is unknown, nor is it certain whether its native country is Persia, or some more remote region of Central Asia. It has a pure musky odor, and is used as a substitute for musk.

**MUSK RAT**, or **Desman** (*Mygale or Galemys*), a genus of insectivorous quadrupeds of the Shrew (q. v.) family (*Soricidae*), differing from the true Shrews (*Sorex*) in having two very small teeth between the two large incisors of the lower jaw, and the upper incisors flattened and triangular. Behind these incisors are six or seven small teeth (lateral incisors or false canine teeth) and four jagged molars. The muzzle is elongated into a small flexible proboscis, which is constantly in motion. The eyes are very small; there are no external ears; the fur is long, straight, and divergent; the tail long, scaly, and flattened at the sides. All the feet have five toes, fully webbed; and the animals are entirely aquatic, inhabiting lakes and rivers, and making holes in the banks with the entrance from beneath the surface of the water.

**Musk**  
**Mussel**

358

Only two species are known, one (*M. or G. Pyrenaica*) about eight inches long, with tail as long as the body, a native of the streams of the Pyrenees; another larger species (*M. or G. moschata*), very plentiful in the Volga and other rivers and lakes of the south of Russia, nearly equal in size to the common hedgehog, with tail about three-fourths of the length of the body. The Russian desman is blackish above, whitish beneath; it has long silky hair, with a softer felt beneath, and its fur is held in some esteem. Desman skins, however, are chiefly valued on account of the musky odor which they long exhale, and which is derived from a fatty secretion produced by small follicles under the tail of the animal. The desman feeds on leeches, aquatic larvae, &c., searching for them in the mud by means of its flexible proboscis. It seldom, if ever, voluntarily leaves the water, except in the interior of its burrows, which are sometimes twenty feet long.

**MUSK RAT** (*Sorex murinus*), an Indian species of Shrew (q. v.), in size about equal to the common brown rat, in form and color much resembling the common shrew of Britain, but remarkable for the powerful musky odor of a secretion which proceeds from glands on its belly and flanks. This odor adheres most pertinaciously to any object with which the animal may come in contact, and provisions are often utterly spoiled by it. Even wine and beer are said to be spoiled by it, in spite of the glass and cork of the bottle; although the probability is much greater that it adheres to the outside of the bottle, and that the liquid is spoiled as it is poured out. One of the Indian names of this animal is *Sondelt*.

**MUSK RAT.** See **MUSQUASH**.

**MUSKET**, or *Musquet* (Fr. *mousquet*; from *mouchet*, a sparrow-hawk; in the same way that other shooting implements were named *falcon*, *falconet*, &c.), the firearm for infantry soldiers, which succeeded the clumsy harquebuss, and in 1851 gave way before the Enfield rifle, which, in its turn, was converted into Snider's patent breech-loading rifle, now known as the Snider-Enfield; the latter arm, so far as the regular in infantry is concerned, has been replaced by the Martini-Henry breech-loader, but the navy, cavalry, and auxiliary forces still retain the Snider. The first muskets were matchlocks; after which came wheel-locks, snaphaups or snaphaues, and flint muskets; and lastly, percussion muskets, which were a vast improvement, both for accuracy and lightness, on all which had gone before. Compared, however, to either the Enfield or Martini-Henry rifle, the musket, familiarly known as Brown Bess (possibly a corruption of Ger. *büchse*, a hollow tube or gun)—was a heavy ugly, and ineffective weapon. The following is a table of the ranges attained, on an average, by the musket, the Enfield, and the Martini-Henry:

	Musket.	Enfield Rifle.	Martini-Henry Rifle.
	yds.	yds.	yds.
Accurate fire.....	100	600	1200
Effective against detached parties.....	150	800	1500
Effective against troops in column.....	250	1000	1800

**MUSKETTOON**, an obsolete weapon, was a short musket of very wide bore, carrying a ball of five ounces, and sometimes bell-mouthed like a blunderbuss.

**MUSKETRY**, Schools of. When the introduction of the Minié rifle in the French service, and the subsequent arming of the British troops with the still more delicate Enfield rifle in 1851, brought the accuracy of a soldier's fire to be an important consideration in estimating his value (which with the old musket was not the case, as it was proverbial that the bullet never hit the point aimed at, however carefully), the English government at once saw the necessity of providing instruction in the manipulation of the rifle. Accordingly, instructors of musketry were attached to the troops, one to each regiment; and a school was established at Hythe in 1854, under the late General (then Colonel) Hay, where lessons on the theory of the arm, and practice in its actual employment, were the sole occupation of the day. Officers and promising men were sent there as fast as the accommodation permitted; and after a course of a few weeks were able to return to their corps, and become instructors to their comrades, so that the shooting of the whole army soon rose in a surprising degree. Whereas, before the establishment of this school, the English stood low in the scale of shooting, the competitions held during recent years at Wimble-

don have demonstrated that no nation can now excel them as marksmen. The formation of the volunteer corps, in 1859, led to a greatly increased demand for musketry instruction, which the government met by forming a second school of musketry at Fleetwood (now abandoned), where the troops and volunteers of Scotland, Ireland, and the northern English counties, found the necessary teaching. The Hythe school is superintended by a commandant and inspector-general of musketry instruction, with subordinate instructors. The inspector-general is responsible also for the instruction throughout the regiments all over the world, and to him the musketry returns from each regiment are sent annually.

MUSLIN, a cotton fabric of Oriental origin, is said to have derived its name from the town of Mosul, in Mesopotamia, where this material was at one time very largely manufactured. At present no such trade exists there; and for muslins, of the common kinds at least, the Indian market depends upon the manufactures of England and France. But no European manufacturer has ever been able to rival the wonderfully fine muslins of Dacca. This does not arise so much from the fineness of the yarn, although that too is very great, but from the marvellous fineness conjoined with a most delicate softness to the touch. The fineness of the yarn is so great, that until lately no machinery could produce anything like it; a piece of Dacca muslin, shewn in the International Exhibition (1862), was 81 feet in length by 3 feet in width, and contained in a square inch 104 warp threads and 100 weft threads, yet the entire piece weighed only 3½ ounces. A French manufacturer, M. Thivel Michon of Tavares, has made a muslin of English yarn spun by the Messrs Houldsworth of Manchester, which surpassed the finest Dacca in the excessive thinness of the yarn, but it wanted its delicate softness. Muslin is much less compact in its texture than calico, indeed it more nearly resembles gauze in appearance; but it is woven plain, without any twisting of the weft threads with those of the warp. The manufacture of muslins in Great Britain and France is very extensive, especially printed muslins, in which the patterns are produced by the same processes as in calico-printing. See WEAVING.

MU'SNUD, a Persian throne of state.

MUSOPHA'GIDÆ. See PLAINTAIN-EATER.

MUSQUASH, Musk-Rat, or Ondatra (*Fiber zibethicus*), a rodent quadruped, a native of North America. It is the only known species of the genus to which it belongs, which is characterised by dentition similar to that of the voles; in some other characters more nearly agreeing with the beaver. The M. is in shape nearly similar to the brown rat; the head and body are about 15 inches in length, the tail ten inches. The whole body is covered with a short dawny dark-brown fur, intermixed with longer and coarser hairs. It is common in almost all parts of North America, from lat. 30° to lat. 69°, except in the southern alluvial districts. It is a very aquatic animal, seldom wandering from the rivers, lakes, or marshes in which it makes its abode. The fur is in demand, and forms an article of commerce—skins in large number being still exported from America to Britain and other European countries. The M. burrows in the banks of streams and ponds; the entrances of its burrows being always under water, so that it must dive to reach them. In marshes, the M. builds a kind of hut, collecting coarse grasses and mud, and raising the fabric from two to four feet about the water. The flesh of the M., at those seasons when it is fat, is in some request among the American Indians, and is said to be not unpalatable.

MUSSEL (*Mytilus*), a genus of lamellibranchiate molluscs, the type of the family *Mytilidæ*, which, however, is much more restricted than the Linnean genus *Mytilus*. The *Mytilidæ* belong to the division of *Lamellibranchiata*, called by Lamarck *Dinyparia*, having two adductor muscles—muscles employed in closing the valves of the shell. The mantle has a distinct anal orifice; the foot is small; and there is a large *Byssus* (q. v.), which is divided into fibres to its base. The valves of the shell are equal; the hinge is destitute of teeth. Some, but few, of the species are found in fresh-water. See DREISSENA. Some (*Lithodomus*) burrow in stone. How they do it is utterly unknown, but they do burrow even in the hardest stone; and some small tropical species excavate for themselves holes in the shells of great limpets. The *Lithodomus* are sometimes called *Datys* shells. Some of them are very beautiful,

Musselburgh  
Mustard

360

which is the case also with the true mussels, after the epidermis is removed. Even the COMMON *M. (M. edulis)* then exhibits beautiful veins of blue. This species is very abundant on the British coasts, and is much used as bait by fishermen. It is gregarious, and is found in vast beds, closely crowded, adhering by the byssus to rocks, &c. These beds are usually uncovered at low-water. The shell is oblong; at its greatest size about three inches long, and an inch and a half broad. Mussels, when young, move about by means of the foot, with which they lay hold of objects, and drag themselves along, until they find some suitable spot to anchor themselves by a byssus. If detached, they soon find another anchorage. In an aquarium they readily attach their byssus-threads even to the smooth glass, and the threads may be broken more easily than separated from the glass. An ingenious and important application of the strength of these threads has been made by the French, to render Cherbourg breakwater more secure by binding the loose stones together, for which purpose it was planted with tons of mussels. The Common *M.* is much used as an article of food, and is generally found quite wholesome; yet it sometimes proves poisonous, particularly in spring and summer, either causing blotches, swellings, and an eruption, accompanied with asthma, or a kind of paralysis, and even sometimes producing delirium and death. For the FRESH-WATER MUSSEL, see that article.

MUSSELBURGH, a small seaport and royal and parliamentary burgh of Scotland, in the county of Edinburgh, is situated at the mouth of the Eek, 6 miles east of Edinburgh. On the west side of the Eek is the fishing village of Fisherrow. Tanning, leather-dressing, and the manufacture of sailcloth, nets, and salt are carried on. The harbor of Fisherrow is frequented by coasting craft, and by small vessels from Holland and the Baltic. Timber, oil-cake, bark, seeds, and hides are imported; coal is the chief export. On the "links," a famous golfing ground, the Edinburgh races take place annually. *M.* unites with Leith and Portobello in sending a member to Parliament. Pop. (1871) 7517.

MUSSET, Louis Charles Alfred de, one of the foremost of recent French poets, was born at Paris, 11th Nov. 1810. He studied in succession medicine, law, finance, and painting; but finally, under the influence of the Romantic School (q. v.), devoted himself to poetry. The first work that attracted notice was "*Les Contes d'Espagne et d'Italie*" (1830), which by their elegant but audacious sensuousness gave deep offence. "*Le Spectacle dans un Fauteuil*" (1832) is a strange medley of contrasts. "*Les Nuits*" (1840), admittedly show his lyrical power at its best. Many of the "*Comédies et Proverbes*" were popular on the stage; and *M.* wrote several prose romances. In 1852 he was admitted to the French Academy. He died at Paris, 2d May 1857. The exquisite beauty, tenderness, and power of much of *M.*'s work is continually marred by the morbid pessimism of a man prematurely old, disillusioned, *blasé*; on this very ground *M.* is often regarded as the representative poet of the modern Parisian.

MU'STANG. See HORSE.

MUSTARD (*Sinapis*), a genus of plants of the natural order *Crucifera*, having yellow flowers, and linear or oblong pods, which terminate in a sword-shaped and compressed or 4-cornered beak, and contain one row of seeds. The seeds are globular, and their Cotyledons (q. v.) conduplicate.—The most important species is BLACK *M.* (*S. nigra*), an annual, which grows wild in fields and by waysides in the middle and south of Europe, and is not uncommon in the southern parts of Britain. Its pods are bluntly 4-angled, smooth, erect, and lie close to the stem, their valves 1-nerved; the leaves are smooth, the lower leaves lyrate, the upper leaves linear-lanceolate. The seeds are brownish black.—WHITE *M.* (*S. alba*), also a native of most parts of Europe, and of the southern parts of Britain, is an annual, having divergent pods covered with stiff hairs, the valves 5-nerved, the seeds yellowish, the leaves pinnatifid.—Both these species are cultivated in England and elsewhere, for their seeds, which are ground into powder and mixed with water, to make the well-known condiment called *Mustard*. The powder of the seeds is also much used in medicine as a rubefacient. The use of *M.* as a condiment is often found favorable to digestion. *M.* seeds depend for their purgency on a principle which, when water is added to Black *M.*, forms *Volatile Oil of Mustard*. (See next article.) There is also in the seeds a bland fixed oil, *Oil of M.*, which is obtained from them by expression, and

constitutes about 28 per cent. of their weight. The cake which remains after the oil is expressed, is too acrid to be freely used for feeding cattle. It is Black M. which is chiefly cultivated, its seed being more pungent and powerful than that of White M.; but there is more difficulty in removing the skin of its seed than that of White M., which is therefore often preferred, but more in England than on the continent of Europe. M. requires a very rich soil. It is cultivated on the alluvial lands of the level eastern counties of England. Wisbeach, in Cambridgeshire, is the great M. market of England.—White M. is often sown in gardens and forced in hot-houses, to be used in the seed-leaf as a small salad, having a pleasant pungency. It is also sometimes sown for feeding sheep, when turnip or rape has failed, being of very rapid growth, although inferior in quantity of crop.—WILD M., or CHARLOCK (*S. arvensis*), which is distinguished by turgid and knotty pods with many angles and longer than the two-edged beak, is a most troublesome annual weed in cornfields in Britain, often making them yellow with its flowers in the beginning of summer. Its seeds are said to have yielded the original *Durham M.*, and are still gathered for mixing with those of the cultivated species. The bland oil of the seeds is used for lumps.—PEKIN M. (*S. Pekinensis*) is an annual, very extensively cultivated in China, its leaves being used as greens. It is quite hardy in the climate of Britain.—INDIAN M. (*S. ramosa*) is extensively cultivated in India for its seeds, which are used as a condiment; as are those of *S. dichotoma* and *S. glauca*, also cultivated in India. The oil of the seeds is much used throughout India for lamps. HILL M. is a different genus, *Bunias* (q. v.).—The M. TREE of Scripture is supposed to be *Salvadora Persica*, a small tree of the natural order *Salvadoraceae*, a small order allied to *Myrsinaceae*. It abounds in many parts of the East. The seed has an aromatic pungency, and is used like mustard. The fruit is a berry with a pungent taste.

**Manufacture.**—The manufacture of M. as it was originally used in this country, and as it still is on the continent, consisted in simply grinding the seed into very fine meal. A false taste, however, arose for having an improved color, and the flour of mustard was introduced, in which only the interior portion of the seed is used, the husk being separated, as the bran is from wheaten flour. This causes a great loss of flavor, as the pungent oil, on which the flavor chiefly depends, exists in greatest abundance in the husk.—Hence other materials, such as capsicum powder, and other very pungent matters, are added to bring up the flavor, and wheaten flour and other substances are added to increase the bulk and lightness of color. Indeed, so many sophistications have been added, that the M. of the English tables can no longer be regarded in any other light than an elaborately compounded condiment, for which each manufacturer has his own particular recipe.

**MUSTARD, Oil of.** The seeds both of the black and the white mustard yield by expression a large quantity of a bland fixed oil, but they do not contain any essential or volatile oil ready formed. It is only the black mustard which by distillation yields the compound usually known as the oil or essence of mustard, and which is in reality sulphocyanide of allyl (see GARLIC, OIL OF) contaminated with a little brown resinous matter, from which it may be freed by simple re-distillation.

When first obtained, it is a colorless fluid, which gradually becomes yellowish. It has a painfully pungent odor and acrid taste; and when applied to the skin, it speedily raises a blister. It is soluble in all proportions in alcohol, but dissolves very sparingly in water. In the article already referred to, it has been shewn that this oil and oil of garlic are naturally convertible into one another; in combination with ammonia it forms a compound which is termed *thiosinnamine*, and which combines directly with acids like a true organic base. Its mode of formation is explained by the equation—

Oil of Mustard. Ammonia. Thiosinnamine.

By digesting oil of mustard with alkalis, or with hydrated oxide of lead, we also obtain a feeble base termed *sinapoline*, whose formula is  $\text{C}_{14}\text{H}_{12}\text{N}_2\text{O}_2$ .

The oil is formed in much the same way as the Volatile Oil of Almonds (q. v.). The black mustard contains the potash salt of a compound termed *myronic acid*, and a peculiar coagulable nitrogenous ferment, which, when the crushed seed is moistened with water, act upon each other, and develop the oil. It is the gradual

Mustelidæ  
Mutiny

362

formation of this oil, when powdered mustard and warm water are mixed, that occasions the special action of the common mustard poultice. The pungency of mustard as a condiment, of horse-radish, &c., is mainly due to the presence of this oil.

**MUSTELIDÆ**, a family of digitigrade Carnivora (q. v.), mostly forming the genus *Mustela* of Linneus; now divided into a number of genera, in which are ranked the weasel, ermine or stoat, sable, marten, ferret, polecat, mink, skunk, &c. The *M.* are distinguished by the elongated form of the body, and the shortness of the limbs; also by having generally four or five molars on each side in the upper jaw, and five or six in the lower. On each side of both jaws there is a single tuberculate tooth. All the feet have five toes. The skull is much elongated behind the eyes. The *M.* display great litheness and suppleness of movement. They are very carnivorous. Otters are ranked among the mustelidæ.

**MUSTER** (It. *mostrare*, from Lat. *monstrare*, to shew) is a calling over of the names of all the men composing a regiment or a ship's company. Each man present answers to his name, those not answering being returned as absent. The muster-roll from which the names are called is the paymaster's voucher for the pay he issues, and must be signed by the commanding officer, the adjutant, and himself. The crime of signing a false master-roll, or of personating another individual at a muster, is held most severely punishable—by imprisonment and flogging for a common soldier, by immediate cashiering in the case of an officer. In regiments of the line, a muster is taken on the 24th of each month; in ships of war, weekly. The muster after a battle is a melancholy proceeding, intended to shew the casualties death has wrought. In early times, before the army was a standing force, and when each captain was a sort of contractor to the crown for so many men, the muster was most important, as the only security the sovereign had that he really obtained the services of the number of men for whom he paid. Accordingly, any fraud, as making a false return, or as mustering with his troop men not actually serving in it, was by the Articles of War of Henry V. made punishable with death for the second offence, and by Charles I. with death "without mercy" for even the first such crime; while any person abetting in any way in the fraud shared the penalty.

**MU'SULMAN**, *Moslem*, a Mohammedan (from Arab. *Salama*), equivalent to Moslem, of which word it is, properly speaking, the plural; used in Persian fashion for the singular. We need hardly add that this Arabic plural termination of "ân," has nothing whatever to do with our word *man*, and that a further English plural in *men*, is both barbarous and absurd.

**MUTE**, a small instrument used to modify the sound of the violin or violoncello. It is made of hard wood, ivory, or brass, and is attached to the bridge by means of a slit, a leg of it being interjected between every two strings. The use of the mute both softens the tone, and imparts to it a peculiar muffled and tremulous quality, which is sometimes very effective. Its application is indicated by the letters, *a. a.*, or *con sordina*, and its discontinuance by *a. a.*, or *senza sordina*. The mute is sometimes used for the cornet, being inserted into the bell of the instrument, thereby subduing the sound, and producing the effect of great distance.

**MUTINY** (Fr. *mutiner*, from *mutin*, "riotous." "Mutin" is connected with an old French *meute*, still seen in *émeute*, a "sedition," and is therefore from the Latin *movere*, "to move" or "stir up." The supposition that the word is derived from the Latin *mutio*, a "muttering," is a mistake). The term is used to denote behavior either by word or deed subversive of discipline, or tending to undermine superior authority. Till lately, mutiny comprised speaking disrespectfully of the sovereign, royal family, or general commanding, quarrelling, and resisting arrest while quarrelling, but these offences have now been reduced to the lesser crime of "mutinous conduct." The acts now constituting mutiny proper are, exciting, causing, or joining in any mutiny or sedition; when present thereof, failing to use the utmost effort to suppress it; when, knowing of a mutiny or intended mutiny, failing to give notice of it to the commanding officer; striking a superior officer, or using or offering any violence against him, while in the execution of his duty; disobeying the lawful command of a superior officer. The punishment awarded by the Mutiny Act to these crimes is, if the culprit be an officer, death or such other punishment as

a general court-martial shall award; if a soldier, death, penal servitude for not less than four years, or such other punishment as a general court-martial shall award. As the crime of mutiny has a tendency to immediately destroy all authority and all cohesion in the naval or military body, commanding officers have strong powers to stop it summarily. A drum-head court-martial may sentence an offender, and if the case be urgent, and the spread of the mutiny apprehended, the immediate execution of the mutineer may follow within a few minutes of the detection of his crime. It, however, behoves commanding officers to exercise this extraordinary power with great caution, as the use of so absolute an authority is narrowly and jealously watched. To prevent mutiny among men, the officers should be strict without harshness, kind without familiarity, attentive to all the just rights of their subordinates, and, above all things, most particular in the carrying out to the very letter of any promise they may have made.

MUTINY ACT is an Act of the British parliament, passed from year to year, investing the crown with large powers to regulate the good government of the army and navy, and to frame the articles of war. By the Bill of Rights, the maintenance of a standing army in time of peace, unless by consent of parliament, was declared illegal, and from that time the number of troops to be maintained, and the cost of the different branches of the service, have been regulated by an annual vote of the House of Commons. But parliament possesses a further and very important source of control over the army. Soldiers, in time of war or rebellion, being subject to martial law, may be punished for mutiny or desertion; but the occurrence of a mutiny in certain Scotch regiments soon after the Revolution, raised the question, whether military discipline could be maintained in time of peace; and it was decided by the courts of law, that, in the absence of any statute to enforce discipline and punish military offences, a soldier was only amenable to the common law of the country; if he deserted, he was only liable for breach of contract, or if he struck his officer, to an indictment for assault. The authority of the legislature thus became indispensable to the maintenance of military discipline, and parliament has, since 1689, at the beginning of every session, conferred this and other powers in an act called the Mutiny Act, limited in its duration to a year. Although it is greatly changed from the form in which it first passed, 175 years ago, the annual alterations in this act are now very slight, and substantially it has a fixed form. The preamble starts with the above quoted declaration from the Bill of Rights, and adds, that it is judged necessary by the sovereign and parliament that a force of such a number should be continued, "for the safety of the United Kingdom, the defence of the possessions of the crown;" while it gives authority to the sovereign to enact Articles of War for the control and government of the force granted. The act comprises 107 clauses, of which the first five specify the persons liable to its provisions—viz., all enlisted soldiers or commissioned officers on full pay, and to those of the regular army, militia, or yeomanry, when employed on active service, and to recruits for the militia while under training. Clauses 6—14, treat of courts-martial, their procedure and powers. Clauses 15—28, relate to crimes and their punishment, the leading offences being mutiny, desertion, cowardice, treason, insubordination, for each of which death may be the penalty; frauds, embezzlement, &c., for which penal servitude is awarded. Clauses 29—33, provide for the government of military prisons, and for the reception of soldiers in civil jails, under the sentences of courts-martial. Clauses 34—37, enact rules to guide civil magistrates in apprehending deserters or persons suspected of desertion. Clause 38 refers to furlough; 39—41, on the privileges of soldiers, enact that officers may not be sheriffs or mayors; that no person acquitted or convicted by a civil magistrate or jury be tried by court-martial for the same offence; and that soldiers can only be taken out of the service for debts above £20, and for felony or misdemeanor. Clauses 42—59, have reference to Enlistment (q. v.); 60—74, to stoppages, billets, carriages, and ferries, providing for the compulsory conveyance and entertainment of troops by innkeepers. Clause 75 relates to the discharge of soldiers; and the remaining 23 clauses advert to miscellaneous matters, and the penalties under the act on civil functionaries who neglect to comply with its requirements. By clauses 106 and 106 the militia, yeomanry, and volunteers, may, on emergency, be attached to the Regular Forces. Clause 107 renders a soldier liable to maintain his wife and children, and his bastard children.

## MUTUAL INSTRUCTION. See MONITORIAL SYSTEM.

**MU'TTRA**, or Mathurá, a town of British India, capital of a district in the n. w. Provinces, 97 miles s.e. of Delhi, is situated on the right bank of the Jamna. The fort was built by the celebrated astronomer, Jey Singh (who became Prince of Amber in 1698); and on the roof of one of the apartments is a ruinous observatory, containing a great number of astronomical instruments. Access is had to the river—which, along with the town, is considered sacred by the Hindus—by numerous gháts, ornamented with little temples; and its banks are, every morning and evening, crowded by devotees of all ages and both sexes, to perform their religious exercises. In Hindu Mythology, it is regarded as the birthplace of the divinity Krishna. In honor of the monkey-god Hanuman, monkeys are here protected and fed, being allowed to swarm everywhere. There are also great numbers of parrots, peacocks, and sacred bulls at large, without owners. There is a very extensive military cantonment about a mile south of the town. *M.* appears at an early period to have been of much more importance than it is at present; and its enormous wealth and splendor made it an object of attack to the first Afghan invaders. Mahmud of Ghuznee, in 1017, gave it up to plunder, breaking down and burning all the idols, and amassing a vast quantity of gold and silver, of which the idols were made. After this calamity, it sank into comparative obscurity. In Oct. 1803, it was, without resistance, occupied by the British troops. Pop. (1872) 59,281.

**MU'TULE**, a plain block under the corona of the cornice of the Doric style, similar in position to the modallio of the Corinthian order, and having a number of guttæ or drops worked on the under side. See ENTABLATURE.

**MU'TUUM** is a term used in Scotch Law, borrowed from the Roman law, to denote a contract of loan of a certain kind of things, as corn, wine, money, which are consumed in the use, and as to which the borrower is bound to restore as much of the same kind at some future time.

**MUZA IBN NOSEYR**, the Arab conqueror of Spain, was born 640 A.D. He displayed great bravery and high military talents in the contests of that turbulent period, so much so that he was appointed by the calif general of the army which was raised for the conquest of Africa in 698—699. After an insignificant expedition into the interior of Africa, he set out in 707 for Mauritania, conquering the kindred tribes of Eastern Barbary, and enrolling their warriors under his standard; and by 709, the whole of Northern Africa, including the Gothic strongholds on the coast, acknowledged the authority of the calif. At this period the Gothic monarchy in Spain was in a state of complete disorganisation, and *M.*, seizing the favorable opportunity thus presented, sent his lieutenant, Tarik Ibn Zefad, in April 711 to make an incursion into Spain. Tarik landed at Gibraltar, marched inland to the banks of the Guadalete, where he was met by Roderic the Gothic king. In the battle which ensued, the Goths were decisively vanquished, their king perished in the waters of the Guadalete, and the whole of Southern Spain lay at the mercy of the victor. *M.*, on hearing of these successes, sent orders to Tarik to halt for further instructions; but the lieutenant, flushed with success, pressed on to the very centre of Spain, and seized Toledo, the capital of the Gothic kingdom. *M.* immediately set out for Spain at the head of 18,000 men (June 712), took Seville, Carmona, Merida, and other towns, and then marched upon Toledo, where he joined Tarik, whom he caused to be bastinadoed and incarcerated, but afterwards reinstated in obedience to an order from the calif. *M.* then marched first north-west and then east, subduing the country as he went; he then crossed the Pyrenees into France, but soon after returned to Spain, where he and Tarik received messages from the calif, commanding their immediate presence at Damascus; Tarik immediately obeyed, but *M.* delayed till a second message was sent to him. On reaching Damascus, he was treated with neglect, and, on the accession of the Calif Suleiman, was cast into prison, and mulcted in 200,000 pieces of gold; his two sons were deprived of their governments of Kairwan and Tangier; and the third son, who governed Spain in his father's absence, was beheaded, and his head sent to Muza. *M.* died soon after in the greatest poverty, at Hedjaz, 717 A.D.

**MYCELIUM**, in Botany, a development of vegetable life peculiar to *Fungi*, but apparently common to all the species of that order. The *spawn* of mushrooms is

the Mycelium. The *M.* appears to be a provision for the propagation of the plant where its spores may not reach, its extension in the soil or matrix in which it exists, and its preservation when circumstances are unfavorable to its further development. It consists of elongated filaments, simple or jointed, situated either within the matrix or upon its surface. It is often membranous or pulpy. The development of the fungus in its proper form seems to be ready to take place, in proper circumstances, from any part of the Mycelium. Fungi often remain long in the state of *M.*, and many kinds of *M.* have been described as distinct species and formed into genera. Fries has rendered great service to botany in investigating these spurious species and genera, and determining their true nature.—Liquors, in which the flocculent *M.* of a fungus is spreading, are said to be *mother*.

MYCENÆ, a very ancient city in the northeastern part of Argolis, in the Peloponnese, built upon a craggy height, is said to have been founded by Persens. It was the capital of Agamemnon's kingdom, and was at that time the principal city in Greece. About 463 B. C., it was destroyed by the inhabitants of Argos, and never rose again from its ruins to anything like its former prosperity. In Strabo's time its ruins only remained; these are still to be seen in the neighborhood of Kharvati, and are specimens of Cyclopean architecture. The most celebrated is the "Gate of Lions," the chief entrance to the ancient Acropolis. Excavations prosecuted at *M.* by Dr Henry Schliemann, brought to light in 1876 several ancient tombs, containing a large quantity of gold and silver ornaments, &c.

MYELITIS (*myelos*, marrow) is the term employed to signify inflammation of the substance of the spinal cord. It may be either acute or chronic, but the latter is by far the most common affection. The *chronic* form begins with a little uneasiness in the spine, somewhat disordered sensations in the extremities, and unusual fatigue after any slight exertion. After a short time paralytic symptoms appear, and slowly increase. The gait becomes uncertain and tottering, and at length the limbs fail to support the body. The paralysis finally attacks the bladder and rectum, and the evacuations are discharged involuntarily; and death takes place as the result of exhaustion, or occasionally of asphyxia if the paralysis involves the chest. In the *acute* form there is much pain (especially in the spinal region), which usually ceases when paralysis supervenes. The other symptoms are the same as those of the chronic form, but they occur more rapidly and with greater severity, and death sometimes takes place in a few days.

The most common causes of this disease are falls, blows, and strains from over-exertion; but sexual abuses and intemperate habits occasionally induce it. It may also result from other diseases of the spine (as caries), or may be propagated from inflammation of the corresponding tissue of the brain.

The treatment, which is much the same as that of inflammation elsewhere, must be confined entirely to the medical practitioner; and it is therefore unnecessary to enter into any details regarding it. When confirmed paralysis has set in, there is little to hope for, but in the early stage the disease is often checked by judicious remedies.

MYGALE, a genus of spiders, the type of a family called *Mygalidæ*. They have four pulmonary sacs and spiracles, four spinnerets, eight eyes, and hairy legs. They make silken nests in clefts of trees, rocks, &c., or in the ground, sometimes burrowing to a great depth, and very tortuously. To this genus belongs the bird-catching Spider (q. v.) of Surinam; but it seems now to be ascertained that several of the larger species frequently prey on small vertebrate animals. They do not take their prey by means of webs, but hunt for it and pounce upon it by surprise. They construct a silken dwelling for themselves in some sheltered retreat. Some of them make a curious lid to their nest or burrow. They envelop their eggs, which are numerous, in a kind of cocoon.

MYLABRIS, a genus of coleopterous insects, nearly allied to *Cantharis* (q. v.), and deserving of notice because of the use made of some of the species as blistering flies. *M. eichorii* is thus used in China and India; and *M. Fuessetini*, a native of the south of Europe, is supposed to have been the blistering fly of the ancients.

MYLITTA (? corresponding to Heb. *Meyleadeh*, Genitrix, who causes to bear), a female deity, apparently first worshipped among the Babylonians, who gradually

**Myllodon**  
**Myrrh**

366

spread her worship through Assyria and Persia. She is originally, like almost every other mythological deity, a cosmic symbol, and represents the female portion of the twofold principle through which all creation burst into existence, and which alone, by its united active and passive powers, upholds it. *M.* is to a certain degree the representative of Earth, the Mother who conceives from the Sun, Bel or Baal. *M.* and Baal together are considered the type of the "Good." Procreation thus being the basis of *M.*'s office in nature, the act itself became a kind of worship to *M.*, and was hallowed through and for her. Thus it came to pass that every Babylonian woman had once in her life to give herself up to a stranger, and thereby considered her person consecrated to the great goddess. The sacrifice itself seems, especially in the early stage of its introduction among the divine rites of the primitive Babylonians, to have had much less of the repulsiveness which, in the eyes of highly-cultivated nations, must be attached to it; and it was only in later days that it gave rise to the proverbial Babylonian lewdness. Herodotus's account of this subject must, like almost all his other stories, be received with great caution.

**MY'LODON** (Gr. grinder-tooth), a genus of huge fossil sloths, whose remains are found in the Pleistocene deposits of South America, associated with the *Megatherium* and other allied genera. A complete skeleton, dug up at Buenos Ayres, measured 11 feet from the fore part of the skull to the end of the tail. Although like the modern sloth in general structure and dentition, its immense size forbids us to suppose that it could have had the same arboreal habits, and the modifications of its structure seem to have fitted it for the uprooting and prostrating of the trees, the foliage of which supplied it with food.

**MY'NIAS**, more accurately *MINYAS*, was, in Greek mythology, the son of Chryseas. He was king of Jolcos, and gave his name to the people called *Minyæ*. He built the city of Orchomenus, where rites (named after him) were celebrated in his honor. His three daughters Clymene, Iris, and Alcithoë, according to Ovid, but Leucothea, Leucippe, and Alcithoë according to other authors, were changed into bats for having contemned the mysteries of Bacchus.

**MYNPURI**, or Mainpuri, a town of British India, capital of a district in the N. W. Provinces, is situated on the banks of a small affluent of the Ganges, 160 miles south-east of Delhi. It lies at an elevation of 820 feet above the sea, and is a favorite station for troops, as provisions and water are abundant and good. *M.* possesses a Jain temple. The rebels were driven from this place in 1857. Pop. (1871) 21,179.

**MYOSO'TIS.** See FORGET-ME-NOT.

**MY'RCIA**, a genus of trees of the natural order *Myrtaceæ*, to which belongs the **WILD CLOVE** or **WILD CINNAMON** of the West Indies (*M. acris*) a handsome tree of 90 or 80 feet high. Its timber is very hard, red, and heavy. Its leaves have an aromatic cinnamon-like smell, and an agreeable astringency, and are used in sauces. Its berries are round, and as large as peas, have an aromatic smell and taste, and are used for culinary purposes.—The leaves, berries, and flower-buds of *M. pimentoides* have a hot taste and fragrant smell, and are also used for culinary purposes.

**MYRIA'PODA** (Gr. myriad-footed), a class of *Articulata*, resembling *Annelids* in their lengthened form, and in the great number of equal, or nearly equal, segments of which the body is composed; but in most of their other characters more nearly agreeing with insects, among which they were ranked by the earlier naturalists, and still are by some. They have a distinct head, but there is no distinction of the other segments, as in insects, into thorax and abdomen. They have simple or compound eyes; a few are destitute of eyes. They have antennæ like those of insects. The mouth is furnished with a complex masticating apparatus, in some resembling that of some insects in a larval state, in others, similar to that of crustaceans. Respiration is carried on through minute pores or spiracles, placed on each side along the entire length of the body, the air being distributed by innumerable ramifying air-tubes to all parts. In most parts of their internal organisation the *M.* resemble insects; although a decided inferiority is exhibited, particularly in the less perfect concentration of the nervous system. The resemblance is greater to insects in their larval than in their perfect state. The body of the *M.* is protected by a hard cuticle.

ous covering. The number of segments is various, seldom fewer than 24; although in some of the higher genera they are consolidated together in pairs, so that each pair, unless closely examined, might be considered as one segment bearing two pairs of feet. The legs of some of the lower kinds, as *Julus* (q. v.), are very numerous, and may be regarded as intermediate between the bristle-like appendages which serve many annulids as organs of locomotion, and the distinctly articulated legs of insects. In the higher M., as *Scolopendra*, the legs are much fewer, and articulated like those of insects. None of the M. have wings. Some of them feed on decaying organic matter, chiefly vegetable; those of higher organisation are carnivorous. The M. do not undergo changes so great as those of insects, but emerge from the egg more similar to what they are ultimately to become; although some of them are at first quite destitute of feet; and, contrary to what takes place in insects, the body becomes more elongated as maturity is approached, the number of segments and of feet increasing.

The M. are divided into two orders: the lower, *Chilognatha* (*Julus*, &c.), having the body sub-cylindrical, the feet very numerous, the head rounded, the mandibles thick and strong; the higher, *Chilopoda* (*Scolopendra*, &c.), having the body flattened, the feet comparatively few, the head broad, the mandibles sharp and curved.

The M. are found in all parts of the world, in the ground, among moss, under stones, in the decaying bark of trees, in decaying roots, and in many similar situations. The largest species are tropical. They are all generally regarded with aversion. It is doubtful how far any of them are injurious to crops, although it is not improbable that they accelerate rottenness already begun; but some (Centipedes) have a venomous and painful bite.

MYRICA. See CANDLEBERRY.

MYRISTICÆÆ. See NUTMEG.

MYRISTIC ACID ( $C_{29}H_{47}O_3$ , HO) is a crystalline fatty acid, found in the seed of the common nutmeg, *Myristica moschata*. It occurs in the form of a glyceride in the fat of the nutmeg, or nutmeg butter. It has recently been found in small quantity amongst the products of the saponification of spermaceti, and of the fatty matter of milk; and hence this organic acid must be ranked amongst those which are common both to the animal and vegetable kingdoms.

MYRMECOPHAGA. See ANT-EATER.

MYROBALANS, the astringent fruit of certain species of *Terminalia*, trees of the natural order *Combretaceæ*, natives of the mountains of India. The genus *Terminalia* has a deciduous bell-shaped calyx and no corolla; the fruit is a juiceless drupe. *T. Belerica*, a species with alternate elliptical entire leaves, on long stalks, produces great part of the M. of commerce; but the fruits of other species often appear under the same name. Tonic properties are ascribed to M.; but although once in great repute, they are now scarcely used in medicine. They are used, however, by tanners and by dyers, and have therefore become a very considerable article of importation from India. They give a durable yellow color with alum, and, with the addition of iron, an excellent black.—*Emblie* M. are the fruit of *Emblica officinalis*, of the natural order *Euphorbiaceæ*, a native of India. They are used in India as a tonic and astringent; also in tanning and in the making of ink.—There is a kind of plum called the *Myrobalan Plum*. See PLUM.

MYRRH (Heb. *mur*), a gum resin produced by *Balsamodendron* (q. v.) *myrrha*, a tree of the natural order *Amyridaceæ*, growing in Arabia, and probably also in Abyssinia. The M. tree is small and scrubby, spiny, with whitish-gray bark, thinly-scattered small leaves, each consisting of three obovate obtusely toothletted leaflets, and the fruit a smooth brown ovate drupe, somewhat larger than a pea. M. exudes from the bark in oily yellowish drops, which gradually thicken and finally become hard, the color at the same time becoming darker. M. has been known and valued from the most ancient times; it is mentioned as an article of commerce in Gen. xxxvii. 25, and was amongst the presents which Jacob sent to the Egyptian ruler, and amongst those which the wise men from the East brought to the infant Jesus. It was an ingredient in the "holy anointing oil" of the Jews. M. appears in commerce either in tears and grains, or in pieces of irregular form and various sizes, yellow, red, or reddish brown. It is brittle, and has a waxy fracture, often exhibit-

**Myrsinaceæ**  
**Mysteris**

368

ing whitish veins. Its smell is balsamic, its taste aromatic and bitter. It is used in medicine as a tonic and stimulant, in disorders of the digestive organs, excessive secretions from the mucous membranes, &c., also to cleanse foul ulcers and promote their healing, and as a dentifrice, particularly in a spongy or ulcerated condition of the gums. It was much used by the ancient Egyptians in embalming. The best *M.* is known in commerce as *Turkey M.*, being brought from Turkish ports; as the name *East Indian M.* is also given to *M.* brought to Europe from the East Indies, although it is not produced there, but comes from Abyssinia. It is not yet certainly known whether the *M.* tree of Abyssinia is the same as that of Arabia, or an allied species.

**MYRSINACEÆ**, a natural order of exogenous plants, consisting of trees and shrubs, natives chiefly of warm climates, and having simple leathery leaves, destitute of stipules; hermaphrodite or unisexual flowers, generally small, but often in umbels, corymba, or panicles; very similar in structure to the flowers of the *Primulacæ*; the fruit generally fleshy, with 1—4 seeds. The flowers are very often marked with sunken dots or glandular lines.—There are more than 300 known species. Many of them are beautiful evergreen shrubs, particularly the genus *Ardisia*. Some have peppery fruit, as *Embelia ribes*.

**MYRTACEÆ**, a natural order of exogenous plants, consisting of trees and shrubs, natives chiefly of warm, but partly also of temperate countries. The order, as defined by the greater number of botanists, includes several suborders, which are regarded by some as distinct orders, particularly **CHAMÆLAUCIACEÆ** (in which are contained about 50 known species, mostly beautiful little bushes, often with fragrant leaves, natives of New Holland), **BARRINGTONIACEÆ** (q. v.), and **LECYTHIDACEÆ** (q. v.). Even as restricted, by the separation of these, the order contains about 1300 known species. The leaves are entire, usually with pellucid dots, and a vein running parallel to and near their margin.—Some of the species are gigantic trees, as the *Eucalypti* or *Gum Trees* of New Holland, and different species of *Metrosideros*, of which one is found as far south as Lord Auckland's Islands, in lat. 50½°. The timber is generally compact.—Astringency seems to be rather a prevalent property in the order, and the leaves or other parts of some species are used in medicine as astringents and tonics. A fragrant or pungent volatile oil is often present in considerable quantity, of which *Oil of Capeput* and *Oil of Cloves* are examples. *Cloves* and *Pimento* are amongst the best known products of the order. The berries of several species are occasionally used as spices in the same way as the true Pimento. A considerable number yield pleasant edible fruits, among which are the **POMEGANATE**, the **GUAVA**, species of the genus *Eugenia*, and some species of myrtle.

**MYRTLE** (*Myrtus*) a genus of *Myrtaceæ*, having the limb of the calyx 4—5 parted, 4—5 petals, numerous free stamens, and almost globose germen, and a 2—3 celled berry, crowned with the limb of the calyx, and containing kidney-shaped seeds. The leaves are opposite and marked with pellucid dots; the flower-stalks are axillary, and generally one-flowered. The **COMMON M.** (*M. communis*) is well known as a beautiful evergreen shrub, or a tree of moderate size, with white flowers. It is a native of all the countries around the Mediterranean Sea, and of the temperate parts of Asia, often forming thickets, which sometimes occur even within the reach of the sea-spray. The leaves are ovate or lanceolate, varying much in breadth. They are astringent and aromatic, containing a volatile oil, and were used in medicine by the ancients as a stimulant. The berries are also aromatic, and are used in medicine in Greece and India. A *M.* wine, called *Myrtidatum*, is made in Tuscany. *M.* bark is used for tanning in many parts of the south of Europe. Among the ancient Greeks, the *M.* was sacred to Venus, as the symbol of youth and beauty, was much used in festivals, and was, as it still is, often mentioned in poetry. The *M.* endures the winters of Britain only in the mildest situations in the south.—The **SMALL-LEAVED M.** of Peru (*M. microphylla*) has red berries of the size of a pea, of a pleasant flavor and sugary sweetness. Those of the **LUMA** (*M. luma*) are also palatable, and are eaten in Chili; as are those of the **DOWNY M.** (*M. tomentosa*), on the Netherberry Hills; and those of the **WHITE-BERRIED M.** (*M. leucocarpa*), by some regarded as a variety of the Common *M.*, in Greece and Syria. The berries of this species or variety are larger than those of the Common *M.*, and have a very

pleasant taste and smell.—A very humble species of *M. (M. nummularia)* spreads over the ground in the Falkland Islands, as thyme does in Britain.

MYRTLE-WAX. See WAX.

MY'SIS, a genus of podothalmons (stalk-eyed) crustaceans, of the order *Stomatopoda*, much resembling the common shrimps in form, although differing from them in the external position of the gills. They are often called *Opossum Shrimps*, because the last two feet are furnished with an appendage, which in the female forms a large pouch, and in this the eggs are received after they leave the ovary, and are retained till the young acquire a form very similar to that of the parent, when the whole brood are at once set free into the ocean. Species of *M.* are found on the British shores, but they are far more abundant in the Arctic seas, where they form no small part of the food of whales, and of many fishes, particularly of different species of salmon.

MYSO'RE, or Maisur, a raj or principality of Southern India, under the protection of the British government, in lat.  $11^{\circ} 35'$ — $15^{\circ}$  n., and in long.  $74^{\circ} 45'$ — $78^{\circ} 45'$  e. It is bounded on the n. by the British collectorate of Dharwar, and otherwise surrounded by districts belonging to the Madras presidency. The area is 27,000 square miles; the pop. in 1871—1872 was 5,055,412. *M.* is an extensive table-land, with an average elevation of about 2000 feet, and with a slope principally toward the north and north-east. The chief rivers are the Cauvery, flowing south-east, and the Tungabhadra, the Mugri, and the Pennar flowing north and north-east. The climate of the higher districts is during a great portion of the year healthy and pleasant. In 1871—1872, the value of the exports, which consist of betel-nut, coffee, cotton, cardamoms, rice, silk, and sugar, amounted to £1,100,000. The imports, consisting mainly of iron, gold, pepper, salt, and pulses, were £1,070,000. Since 1832, the control of the country has been entirely in the hands of the English, and the government is administered by a British commissioner. Chief town, Mysore. For the history of *M.*, see articles HYDER ALI, TIPPOO SAHIB, and INDIA.

MYSO'RE, or Maisur, a city of India, the seat of a British residency, capital of the territory, and of the subdivision of the same name, is situated amid picturesque scenery on a declivity formed by two parallel ranges of elevated ground running north and south, 245 miles west-south-west of Madras, lat.  $12^{\circ} 19'$  n., long.,  $76^{\circ} 43'$  e. The houses are generally built of teak, and among the chief edifices are the British residency and church. The fort is quadrangular in form, three of its sides being 450 yards in length, and the remaining side longer. The rajah's palace, occupying three sides of the interior fort, contains a magnificent chair or throne of gold. The climate is mild, but not healthy; fevers are of frequent occurrence. Carpets are manufactured. Pop. (1872) 57,765.

MY'STAGOGUE (Gr. *mystes*, an initiated person, and *ago*, I lead), the name in the Greek religious system of the priest whose duty it was to direct the preparations of the candidates for initiation in the several mysteries, as well as to conduct the ceremonial of initiation. It was sometimes applied by a sort of analogy to the class of professional *ciceroni*, who in ancient, as still in modern times, undertook to shew to strangers newly arrived in a city the noteworthy objects which it contained; but the former meaning is its primitive one, and formed the ground of the application of the same name in the Christian church, to the catechists or other clergy who prepared candidates for the Christian *mysterics*, or sacraments, of baptism, confirmation, and the eucharist, especially the last. In this sense, the word is constantly used by the fathers of the 4th and 5th centuries; and in the well-known lectures of St Cyril of Jerusalem, although all were addressed to candidates for the *mysterics*, some for baptism, and some for the eucharist, it is only to the lectures addressed to the latter that the name *mystagogic* is applied. This distinction was connected with the well-known Discipline of the Secret; and it appears to have ceased with the abolition or gradual disuse of that discipline.

MYSTERIES (Gr. from *muo*, to close the lips or eyes), also called *Teletai*, *Orgia*, or, in Latin, *Initia*, designate certain rites and ceremonies in ancient, chiefly Greek and Roman religions, only known to, and practised by, congregations of certain

initiated men and women, at appointed seasons, and in strict seclusion. The origin, as well as the real purport of these mysteries, which take no unimportant place among the religious festivals of the classical period, and which, in their ever-changing nature, designate various phases of religious development in the antique world, is all but unknown. It does seem, indeed, as if the vague speculations of modern times on the subject were an echo of the manifold interpretations of the various acts of the mysteries given by the priests to the inquiring disciple—according to the lights of the former or the latter. Some investigators, themselves not entirely free from certain mystic influences (like Cruizer and others), have held them to have been a kind of misty orb around a kernel of pure light, the bright rays of which were too strong for the eyes of the multitude; that, in fact, they hid under an outward garb of mummery a certain portion of the real and eternal truth of religion, the knowledge of which had been derived from some primeval, or, perhaps, the Mosaic revelation; if it could not be traced to certain (or uncertain) Egyptian, Indian, or generally Eastern sources. To this kind of hazy talk, however (which we only mention because it is still repeated every now and then), the real and thorough investigations begun by Lobeck, and still pursued by many competent scholars in our own day, have, or ought to have, put an end. There cannot be anything more alien to the whole spirit of Greek and Roman antiquity than a hiding of abstract truths and occult wisdom under rites and formulas, songs and dances; and, in fact, the mysteries were anything but exclusive, either with respect to sex, age, or rank, in point of initiation. It was only the speculative tendency of later times, when Polytheism was on the wane, that tried to symbolise and allegorise these obscure, and partly imported ceremonies, the bulk of which had undoubtedly sprung from the midst of the Pelasgian tribes themselves in prehistoric times, and which were intended to represent and to celebrate certain natural phenomena in the visible creation. There is certainly no reason to deny that some more refined minds may at a very early period have endeavored to impart a higher sense to these wondrous performances; but these can only be considered as solitary instances. The very fact of their having to be put down in later days as public nuisances in Rome herself, speaks volumes against the occult wisdom inculcated in secret assemblies of men and women.

The mysteries, as such, consisted of purifications, sacrificial offerings, processions, songs, dances, dramatic performances, and the like. The mystic formulas (*Draknumena*, *Dromena*, *Legomena*, the latter including the Liturgies, &c.) were held deep secrets, and could only be communicated to those who had passed the last stage of preparation in the mystagogue's hand. The hold which the nightly secrecy of these meetings, together with their extraordinary worship, must naturally have taken upon minds more fresh and childlike than our advanced ages can boast of, was increased by all the mechanical contrivances of the effects of light and sound which the priests could command. Mysterious voices were heard singing, whispering, and sighing all around, lights gleamed in manifold colors from above and below, figures appeared and disappeared; the mimic, the tonic, the plastic—all the arts, in fact, were taxed to their very utmost to make these performances (the nearest approach to which, in this country, is furnished by transformation-scenes, or sensation-dramas in general) as attractive and profitable (to the priests) as could be. As far as we have any knowledge of the plots of these mysteries as scenic representations, they generally brought the stories of the special gods or goddesses before the spectator—their births, sufferings, deaths, and resurrections. Many were the outward symbols used, of which such as the Phallus, the Thyrus, Flower Baskets, Mystic Boxes, in connection with special deities, told more or less their own tale, although the meanings supplied by later ages, from the Neo-platonists to our own day, are various, and often very amazing. The most important mysteries were, in historical times, those of Eleusis and the Thesmophorian, both representing—each from a different point of view—the rape of Proserpina, and Ceres's search for her: the Thesmophorian mysteries being also in a manner connected with the Dionysian worship. There were further those of Zeus of Crete—derived from a very remote period—of Bacchus himself, of Cybele, and Aphrodite—the two latter with reference to the Mystery of Propagation, but celebrated in diametrically opposed ways, the former culminating in the self-mutilation of the worshipper, the latter in prostitution. Further, the Mysteries of Orpheus, who in a certain degree was considered the founder of all mysteries. Nor were the other gods and goddesses forgotten:

Hera, Minerva, Diana, Hecate, nay, foreign gods like Mithras (q. v.), and the like, had their due secret solemnities all over the classical soil, and whithersoever Greek (and partly Roman) colonists took their Lares and Penates all over the antiquo world. The beginning of the reaction in the minds of thinking men, against this mostly gross and degenerated kind of veneration of natural powers and instincts, is marked by the period of the Hesiodic poems; and when towards the end of the classical periods, the mysteries were no longer secret, but public orgies of the most shameless kind, their days were numbered. The most subtle metaphysicians, allegorists and symbolists as they might, failed in reviving them, and in restoring them to whatever primeval dignity there might have once been inherent in them.

MYSTERIES AND MIRACLE-PLAYS were dramas founded on the historical parts of the Old and New Testaments, and the lives of the saints, performed during the middle ages, first in churches, and afterwards in the streets on fixed or movable stages. Mysteries were properly taken from biblical and miracle-plays from legendary subjects, but this distinction in nomenclature was not always strictly adhered to. We have an extant specimen of the religious play of a date prior to the beginning of the middle ages in the *Christos Paschou*, assigned, somewhat questionably, to Gregory Nazianzen, and written in 4th c. Greek. Next come six Latin plays on subjects connected with the lives of the saints, by Roswitha, a nun of Gandersheim, in Saxony, which, though not very artistically constructed, possess considerable dramatic power and interest; they have been lately published at Paris, with a French translation. The performers were at first the clergy and choristers, afterwards any layman might participate. The earliest recorded performance of a miracle-play took place in England. Matthew Paris relates that Geoffroy, afterwards Abbot of St Albans, while a secular, exhibited at Dunstable the miracle-play of St Catherine and borrowed copes from St Albans to dress his characters. This must have been at the end of the 11th or beginning of the 12th century. Fitzstephen, in his "*Life of Thomas à Becket*" 1188 A. D., describe with approval the representation in London of the sufferings of the saints and miracles of the confessors. On the establishment of the *Corpus Christi* festival by Pope Urban IV. in 1264, miracle-plays became one of its adjuncts, and every considerable town had a fraternity for their performance. Throughout the 15th and following centuries, they continued in full force in England, and are mentioned, sometimes approvingly, sometimes disapprovingly, by contemporary writers. Designed at first as a means of religious instruction for the people, they had long before the Reformation so far departed from their original character, as to be mixed up in many instances with buffoonery and irreverence, intentional or unintentional, and to be the means of inducing contempt rather than respect for the church and religion. Remarkable collections exist of English mysteries and miracles of the 15th c., known as the Chester, the Coventry, and the Towneley plays. The first two have been published by the Shakespeare Society, and the other by the Surtees Society. The Towneley mysteries are full of the burlesque element, and contain many curious illustrations of contemporary manners.

Out of the mysteries and miracle-plays sprang a third class of religious plays called "*Moralities*," in which allegorical personifications of the Virtues and Vices were introduced as *dramatis personae*. These personages at first only took part in the play along with the scriptural or legendary characters, but afterwards entirely superseded them. The oldest known English compositions of this kind are of the time of Henry VI.; they are more elaborate and less interesting than the miracle plays. Moralities continued in fashion till the time of Elizabeth, and were the immediate precursors of the regular drama.

Miracles and mysteries were as popular in France, Germany, Spain, and Italy as in England. A piece of the kind yet extant, composed in France in the 11th c., is entitled the "*Mystery of the Wise and Foolish Virgins*," and written partly in the Provincial dialect and partly in Latin. A celebrated fraternity, called the *Confrérie de la Passion*, founded in Paris in 1350, had a monopoly for the performance of mysteries and miracle-plays, which were of such a length, that the exhibition of each occupied several days. A large number of the French mysteries of the 14th c. are extant. In the alpine districts of Germany, miracle-plays were composed and acted by the peasants; these peasant-plays had less regularity in their dramatic form,

were often interspersed with songs and processions; and in their union of simplicity with high-wrought feeling were most characteristic of the people in whom the religious and dramatic element are both so largely developed. In the early part of last century, they began to partake to a limited extent of the burlesque, which had brought miracle-plays into disrepute elsewhere.

It is a mistake to suppose that the hostility of the reformers was what suppressed these exhibitions. The fathers of the Reformation shewed no unfriendly feeling towards them. Luther is reported to have said that they often did more good and produced more impression than sermons. The most direct encouragement was given to them by the founders of the Swedish Protestant Church, and by the earlier Lutheran bishops, Swedish and Danish. The authorship of one drama of the kind is assigned to Grotius. In England, the greatest check they received was from the rise of the secular drama; yet they continued to be occasionally performed in the times of James I. and Charles I., and it is well known that the first sketch of Milton's "Paradise Lost" was a sacred drama, where the opening speech was Satan's Address to the Sun. A degenerate relic of the miracle-play may yet be traced in some remote districts of England, where the story of St George, the dragon, and Beelzebub, is rudely represented by the peasantry. Strange to say, it was in the Catholic south of Germany, where these miracle-plays and mysteries had preserved most of their old religious character, that the severest blow was levelled against them. Even there, they had begun to be tainted to a limited extent with the burlesque element, which had brought them into disrepute elsewhere. In 1779, a manifesto was issued by the Prince-archbishop of Salzburg, condemning them, and prohibiting their performance, on the ground of their ludicrous mixture of the sacred and the profane, the frequent bad acting in the serious parts, the distraction of the lower orders from more edifying modes of instruction, and the scandal arising from the exposure of sacred subjects to the ridicule of free-thinkers. This ecclesiastical denunciation was followed by vigorous measures on the part of the civil authorities in Austria and Bavaria. One exception was made to the general suppression. In 1633, the villagers of Oberammergau, in the Bavarian highlands, on the cessation of a plague which desolated the surrounding country, had vowed to perform every tenth year the Passion of Our Saviour, out of gratitude, and as a means of religious instruction; a vow which had ever since been regularly observed. The pleading of a deputation of Ammergau peasants with Max. Joseph of Bavaria saved their mystery from the general condemnation, on condition of everything that could offend good taste being expunged. It was then and afterwards somewhat remodelled, and is perhaps the only mystery or miracle-play which has survived to the present day. The last performance took place in 1870. The inhabitants of this secluded village, long noted for their skill in carving in wood and ivory, have a rare union of artistic cultivation with perfect simplicity. Their familiarity with sacred subjects is even beyond what is usual in the alpine part of Germany, and the spectacle seems still to be looked on with feelings much like those with which it was originally conceived. What would elsewhere appear impious, is to the alpine peasants devout and edifying. The personator of Christ considers his part an act of religious worship; he and the other principal performers are said to be selected for their holy life, and consecrated to their work with prayer. The players, about 500 in number, are exclusively the villagers, who, though they have no artistic instruction except from the parish priest, act their parts with no little dramatic power, and a delicate appreciation of character. The New Testament narrative is strictly adhered to, the only legendary addition to it being the St Veronica handkerchief. The acts alternate with *tableaux* from the Old Testament and choral odes. Many thousands of the peasantry are attracted by the spectacle from all parts of the Tyrol and Bavaria, among whom the same earnest and devout demeanor prevails as among the performers. Plays of a humbler description, from subjects in legendary or sacred history, are not unfrequently got up by the villagers around Innsbruck, which shew a certain rude dramatic talent, though not comparable to what is exhibited at Ammergau. Girls very generally represent both the male and female characters.

**MYSTICISM** (Gr. *mystikos*, mystical), a term used with considerable vagueness, but implying that general tendency in religion to higher and more intimate communion with the Divine, to which, in most religions, ancient and modern, certain individuals or classes have laid claim. In the Platonic philosophy, and in the Eastern sys-

tems, from which that philosophy is derived, the human soul being regarded as a portion of the divine nature, it is held to be the great end of life to free the soul from the embarrassment and mental darkness in which it is held by the material trammels of the body in which it is imprisoned. In the pursuit of this end, two very opposite courses were adopted: the first, that of spiritual purification, partly by repressing the natural appetites and weakening the sensual impulses by corporeal austerities, partly by elevating the soul through intense contemplation and withdrawal from the outward objects of sense; the other, that of regarding the soul as superior to the body, independent of its animal impulses, incapable, from its higher origin, of being affected by its outward actions, or sullied by contact with the corruption in which its lower nature might love to wallow. A similar element of M., which, in truth, must form in some sense, a constituent of every religious system, is traceable in the early doctrinal history of Christianity, and the career of Christian M. also divides itself into the same twofold course. Among the early sects external to the church, we trace the first in the system of Tatian and of the Encratites, while the second finds its parallel in the Syrian Gnostics, in Carpocrates, Bardesanes, and in one form at least of the Nicolaitic heresy. Within the Christian church there never has been wanting a continuous manifestation of the mystical element. The language of St Paul in Gal. ii. 20, and in 2d Cor. xii. 2, and many expressions in the Apocalypse, may be taken as the exponents of Christian M., the highest aspiration of which has ever been towards that state in which the Christian "no longer liveth, but Christ liveth in him." And although no regular scheme of M. can be found in the early Fathers, yet the writings of Hermes the Shepherd, the Epistles of St Ignatius, the works of St Clement of Alexandria, the Expositions of Origen, and above all, the Confessions of St Augustine, abound with outpourings of the true spirit of Christian mysticism. It is curious that the first systematic exposition of its principles is said to be in the works of the pseudo-Dionysius the Areopagite; but it was not till the days of the Scholastics that it received its full development, when the mystic life was resolved into its three stages, viz., of Purification, of Illumination, and of Ecstatic Union with God and Absorption in Divine Contemplation. It was upon the explanation of this third stage that the great division of the mediæval mystic schools mainly turned; some of them explaining the union with God in a pantheistic or semipantheistic sense, and thereby annihilating the individual will, and almost the personal action of man in the state of ecstasy; others, with St Bernard, fully preserving both the individuality and the freedom of man, even in the highest spiritual communication with his Creator. Of the former, many, as the Hesychasts (q. v.) in the Greek Church, and the Brethren of the Free Spirit (q. v.) and the Beghards in the Latin, drew from these mystical doctrines the most revolting moral consequences; in others, as Tauler, Ruysbroek, Ekkart, the error does not seem to have gone beyond the sphere of speculation. The writings of Thomas à Kempis (q. v.), of St Catherine of Siena, of St John of the Cross, and of St Teresa, may perhaps be taken as the most characteristic representations of the more modern form of the traditional M. which has come down from the mystics of the middle ages.

The later history of M. in the Roman Catholic Church will be found under the heads of FENELON, MADAME GUYON, MOLINOS, and QUIETISM. The most remarkable followers of the same or kindred doctrines in the Protestant communions are Jacob Böhme (q. v.) of Görlitz, Emmanuel Swedenborg (q. v.), and the celebrated William Law (q. v.).

**MYTH AND MYTHOLOGY.** The word *myth* (Gr. *mythos*), originally signified *speech or discourse*, and was identical with the word *logos*. After the age of Pindar and Herodotus, however, it came to be synonymous with the Latin word *fabula*, *fable*, or *legend*. According to the present use of our language, a myth is an idea or fancy presented in the historical form; and though, of course, any fiction at any time in this shape might be called a myth, yet by usage the word is confined to those fictions made in the early periods of a people's existence, for the purpose of representing their religious belief, and generally their oldest traditions, in an attractive form. The tendency to create myths in this way seems inherent in every people; certainly there is no people so sunk into the brute as to be without them. A myth is not to be confounded with an allegory; the one being an unconscious act of the popular mind at an early stage of society, the other a conscious act of the individual

mind at any stage of social progress. The parables of the New Testament are allegorical; so are *Æsop's Fables*; no one mistakes them for realities; they are known to have been invented for a special didactic purpose, and so received. But the peculiarity of myths is, that they are not only conceived in the narrative form, but generally taken for real narrations by the people to whom they belong, so long at least as they do not pass a certain stage of intellectual culture. Even myths of which the allegorical significance is pretty plain, such as the well-known Greek myth of Prometheus and Epimetheus, were received as facts of early tradition by the Greek. Myths may be divided into several classes, of which the first and most important is the theological and moral. The oldest theology of all nations is in the form of myths; hence the great importance of mythological study, now universally recognised; for it is not occupied merely or mainly with strange fancies and marvellous fictions, invented for the sake of amusement, but contains the fundamental ideas belonging to the moral and religious nature of man as they have been embodied by the imaginative faculty of the most favored races. It is this dominance of the imagination, so characteristic of the early stages of society, which gives to myth its peculiar dramatic expression, and stamps the popular creed of all nations with the character of a poetry of nature, of man, and of God. From the very nature of the case, the myth-producing faculty exercises itself with exuberance only under the polytheistic form of religion; for there only does a sufficient number of celestial personages exist, whose attributes and actions may be exhibited in a narrative form; there is nothing, however, to prevent even a monotheistic people from exhibiting certain great ideas of their faith in a narrative form, so as by prosaic minds to be taken for literal historical facts. But besides strictly theological myths, there are physical myths, that is, fictions representing the most striking appearances and changes of external nature in the form of poetical history; in which view, the connection of legends about giants, chimeras, &c., with regions marked by peculiar volcanic phenomena, has been often remarked. It is difficult indeed, in polytheistic religions, to draw any strict line between physical and theological myths; as the divinity of all the operations of nature is the first postulate of polytheism, and every physical phenomenon becomes the manifestation of a god. Again, though it may appear a contradiction, there are historical myths; that is, marvellous legends about persons, who may with probability be supposed to have actually existed. So intermingled, indeed, is fact with fable in early times, that there must always be a kind of debatable land between plain theological myth and recognised historical fact. This land is occupied by what are called the heroic myths; that is, legends about heroes, concerning whom it may often be doubtful whether they are merely a sort of inferior, and more human-like gods, or only men of more than ordinary powers whom the popular imagination has elevated into demi-gods.

The scientific study of mythology commenced with the ancient nations who produced it, specially with the acute and speculative Greeks. The great mass of the Greek people, indeed—of whom we have a characteristic type in the traveller Pausanias—accepted their oldest legends, in the mass, as divine and human facts; but so early as the time of Euripides, or even before his day in the case of the Sicilians, Epicharmus and Empedocles, we find that philosophers and poets had begun to identify Jove with the upper sky, Apollo with the sun, Juno with the nether atmosphere, and so forth; that is, they interpreted their mythology as a theology and poetry of nature. This, indeed, may be regarded as the prevalent view among all the more reflective and philosophical heathens (who were not, like Xenophon, orthodox believers) up from the age of Pericles, 450 B. C., to the establishment of Christianity. But there was an altogether opposite view, which arose at a later period, under less genial circumstances, and exercised no small influence both on Greek and Roman writers. This view was first prominently put forth by Euhemerus, a Messenian, in the time of the first Ptolemies, and consisted in the flat prosaic assertion, that the gods, equally with the heroes, were originally men, and all the tales about them only human facts sublimed and elevated by the imagination of pious devotees. This view seemed to derive strong support from the known stories about the birth and death of the gods, specially of Jove in Crete; and the growing sceptical tendencies of the scientific school at Alexandria, were of course favorable to the promulgation of such views. The work of Eue-

myths accordingly obtained a wide circulation; and having been translated into Latin, went to nourish that crass form of religious scepticism which was one of the most notable symptoms of the decline of Roman genius at the time of the emperors. Historians, like Diodorus, gladly adopted an interpretation of the popular mythology which promised to swell their stores of reliable material; the myths accordingly were coolly emptied of the poetic soul which inspired them, and the early traditions of the heroic ages were set forth as plain history, with a grave sobriety equally opposed to sound criticism, natural poetry, and good taste.

In modern times the Greek mythology has again formed the basis of much speculation on the character of myths and the general laws of mythical interpretation. The first tendency of modern Christian scholars, following the track long before taken by the fathers, was to refer all Greek mythology to a corruption of Old Testament doctrine and history. Of this system of interpreting myths, we have examples in Vossius, in the learned and fanciful works of Bryant and Faber, and very recently, though with more pious and poetic feeling, in Gladstone. But the Germans, who have taken the lead here, as in other regions of combined research and speculation, have long ago given up this ground as untenable, and have introduced the rational method of interpreting every system of myths, in the first place according to the peculiar laws traceable in its own genius and growth. Ground was broken in this department by Heyne, whose views have been tested, corrected, and enlarged by a great number of learned, ingenious, and philosophical writers among his own countrymen, especially by Buttmann, Voss, Creuzer, Müller, Welcker, Gerhardt, and Preller. The general tendency of the Germans is to start—as Wordsworth does in his “Excursion,” book iv.—from the position of a devout imaginative contemplation of nature, in which the myths originated, and to trace the working out of those ideas, in different places and at different times, with the most critical research, and the most vivid reconstruction. If in this work they have given birth to a large mass of ingenious nonsense and brilliant guess-work, there has not been wanting among them abundance of sober judgment and sound sense to counteract such extravagances. It may be noticed however, as characteristic of their over-speculative intellect, that they have a tendency to bring the sway of theological and physical symbols down into a region of what appears to be plain historical fact; so that Achilles becomes a water-god, Peleus, a mud-god, and the whole of the “Iliad,” according to Forchhammer, a poetical geology of Thessaly and the Troad! Going to the opposite extreme from Euhemerus, they have denied the existence even of deified heroes; all the heroes of Greek tradition, according to Uschold, are only degraded gods; and generally in German writers, a preference of transcendental to simple and obvious explanations of myths is noticeable. Creuzer, some of whose views had been anticipated by Blackwell, in Scotland, is especially remarkable for the high ground of religious and philosophical conception on which he has placed the interpretation of myths; and he was also the first who directed attention to the oriental element in Greek mythology—not, indeed, with sufficient discrimination in many cases, but to the great enrichment of mythological material, and the enlargement of philosophical survey. In the most recent times, by uniting the excursive method of Creuzer with the correction supplied by the more critical method of O. Müller and his successors, the science of comparative mythology has been launched into existence; and specially the comparison of the earliest Greek mythology with the sacred legends of the Hindus, has been ably advocated by Max Müller in the “Oxford Essays” (1856). In France, the views of Euhemerus were propounded by Banier (1739). By the British scholars, mythology is a field that has been very scantily cultivated. Besides those already named, Payne Knight, Mackay, Grote in the first volumes of his history, and Keightley are the only names of any note, and their works can in no wise compete in originality, extent of research, in discriminating criticism, or in largeness of view, with the productions of the German school. The best for common purposes is Keightley; the most original, Payne Knight. Recently, G. W. Cox, in a work on Aryan mythology, has pushed the Sanscritising tendencies of Max Müller to an extreme which to most minds seems absurd. On the special mythologies of India, Rome, Greece, &c., information will be found under the heads of the respective countries to which they belong. The more important mythological personages are noticed under their own names; see BACCHUS, JUPITER, HERCULES, &c.

## N

**N**, the fourteenth letter of the English alphabet, is one of the nasal liquids of the Rûgual class. See **LETTERS**. Its Hebrew (and Phœnician) name, *Nun*, signified a *fish*, which its original form was probably meant to represent. **N** is interchangeable with **L** (q. v.) and **M**, as in *collect*, *commingle*, *confer*; and in Ger. *boden*, compared with Eng. *bottom*. In Latin, this letter had a faint, uncertain sound at the end of words and in some other positions, especially before *s*. This accounts for words in *on* having lost the *n* in the nominative case, though retaining it in the oblique cases, as *homo*, *hominis*; and for Greek names like *Platon* being written without the final *n* in Latin. The dull, muffled pronunciation of *n*, which is indicated by such words as *consul*, *censor*, *testamento*, being frequently spelled *conul*, *cesor*, *testamelo*, was the first stage of the modern French nasal *a*. Before a guttural letter, *n* naturally assumes the sound of *ng*, as *bank*.

**NAAS**, a market and assize town of Kildare County, Ireland, 20½ miles south-west of Dublin, and, next to Athy, the largest town in the county. The population in 1871 was 3660. The principal street is about half a mile in length; the county court-house is in the main street. Having been anciently the seat of the kings of Leinster, **N** was early occupied by the English. A parliament was held in it in 1419, and it obtained charters successively from Henry V., Elizabeth, and James I. At present, **N** is a place of little trade, and is almost entirely without manufactures. It returned two members to the Irish parliament, but was disfranchised at the Union. It is the seat of a diocesan school, and of three national schools, one of which is attached to the Roman Catholic convent. A newspaper, printed at Maryborough, is also published here.

**NA'BOB**, or **Nabab**, a corruption of the word *Nawâb* (deputy), was the title belonging to the administrators, under the Mogul empire, of the separate provinces into which the district of a *Subahdar* (q. v.) was divided. The title was continued under the British rule, but it gradually came to be applied generally to natives who were men of wealth and consideration. In Europe, and especially in Britain, it is applied derisively to those who, having made great fortunes in the Indies, return to their native country, where they live in oriental splendor.

**NABONA'SSAR**, Era of, was the starting-point of Babylonian chronology, and was adopted by the Greeks of Alexandria, Berossus and others. It began with the accession of Nabonassar to the throne—an event calculated (from certain astronomical phenomena recorded by Ptolemy) to have taken place 26th February 747 B.C.

**NÂBULU'S**, or **Nâblu's** (a corruption of the Gr. *Neapolis*, New City, the name given to it in the reign of Vespasian), anciently called **SHËCHEM** or **SICHEM**, in the New Testament (John iv. 5), **SYCHAR**; is a town of Palestine, possessing, it is said, "the only beautiful site from Dan to Beersheba." It lies between Mount Ebal and Mount Gerizim, on the south side of the valley of Erd-Mâkhna, and has a population variously estimated at from 8000 to 14,000, of whom about 600 are Christians, 150 Samaritans, and 50 Jews; the rest are Mohammedans, fierce, turbulent, and fanatical. The houses are pretty good, but the streets (as usual in the East) are narrow, gloomy, and filthy. The chief productions are soap, cotton, and oil—the soap-manufactories are large, and the oil is considered the best in Syria.—See Porter's "Hand-book for Syria and Palestine," and Stanley's "Palestine."

**NACRE**. See **MOTHER OF PEARL**.

**NADIR**, an Arabic word signifying that point in the heavens which is diametrically opposite to the zenith, so that the zenith, nadir, and centre of the earth are in one straight line. The zenith and nadir form the poles of the Horizon (q. v.). See **ZENITH**.

**NADIR SHAH**, of Persia, belonged to the Afshars, a Turkish tribe, and was born near Kelat, in the centre of Khorassan, Persia, in 1688. When 17 years old, he was taken prisoner by the Usbeks, but escaped after four years of captivity; entered the service of the governor of Khorassan, and soon obtained high promotion. Having, however, been degraded and punished for some real or supposed offence, he betook himself to a lawless life, and for several years was the daring leader of a band of 3000 robbers, who levied contributions from almost the whole of Khorassan. An opportunity having occurred, N. seized the town of Kelat, and gradually extended his territorial authority. Persia was at this time ruled by Melek Ashraf, an Afghan of the tribe of Ghilji, whose grinding tyranny and cruelty produced in the mind of every Persian a deadly hatred of the very name Afghan, which exists to the present day. N. having avowed his intention of expelling the hated race from the country and restoring the Saffavean dynasty, numbers flocked to his standard, and Meshed, Herat, and all Khorassan were speedily reduced. Ashraf, signally defeated in several engagements, fled before the avenger, who, with a celerity only equalled by its thoroughness, purged the provinces of Irak, Fars, and Kerman of even the semblance of Afghan domination. The assassination of Ashraf, during his retreat, terminated the war. The rightful heir, Tamasp, then ascended the throne, and N. received for his services the government of the provinces of Khorassan, Mazanderan, Seistan, and Kerman, assuming at the same time the title of Tamasp-kuli (the Slave of Tamasp), the title of khan being subsequently added. He was sent against the Turks in 1731, and defeated them at Hamadan, regaining the Armenian provinces which had been seized by the Turks in the preceding reign; but his sovereign having in his absence engaged unsuccessfully the same enemy, N. caused him to be put in prison, and elevated his infant son, Abbas III., to the throne in 1732. The death of this puppet, in 1736, opened the way for the elevation of N. himself, who was crowned as *Nadir Shah*, February 26, 1736. He resumed the war with the Turks; and though totally defeated in the first two battles by the Grand Vizier Asiman, turned the tide of fortune in the subsequent campaign, and granted peace to the Turks on condition of receiving Georgia. He also conquered Afghanistan, and drove back the invading Usbeks. His ambassador to the Great Mogul having been murdered along with all his suite at Jelalabad, and satisfaction having been refused, N. in revenge ravaged the North-west Provinces, and took Delhi, which he was, by the insane behavior of the inhabitants, reduced to the necessity of pillaging. With booty to the amount of £20,000,000, including the Koh-i-nûr (q. v.) diamond, he returned to the west bank of the Indus. He next reduced Bokhara and Kharezm, restoring to Persia her limits under the golden reign of the Sassanides. From this period, his character underwent a sudden change: he was formerly open-hearted, liberal, and tolerant; he now became suspicious, avaricious, and tyrannical. The empire groaned under his extortions, and he was finally assassinated on the 20th June 1747. His only surviving son was carried to Constantinople, and thence to Vienna, where he was brought up as a Catholic, under the surveillance of the Empress Maria Theresa, and died a major in the Austrian service, under the title of Baron Semlin. N.'s tyranny has now been forgotten; and at the present day, he is regarded with pride and gratitude as the "Wallace" of Persia.

**NÆVIUS**, Cn., one of the earliest Latin poets, was born, probably in Campania, in the first half of the 3d c. B. C. In his youth, he served in the first Punic war; but about the year 235 B. C., he made his appearance at Rome as a dramatic writer. Of his life, we know little; but of his character, rather more. He was very decidedly attached to the plebeian party; and in his plays, satirised and lampooned the Roman nobles with all the virulence and indiscretion of a hot-blooded impetuous Campanian—that Gascon of ancient Italy! His rashness ultimately caused his banishment to Utica in Africa, where he died, 204 or 202 B. C. Besides his dramatic writings, comprising both tragedies and comedies, he wrote an epic poem, "De Bello Punico," in the old Saturnian metre. Of these, only a few very unimportant fragments are extant, which may be found in Bothe's "Poetarum Latiorum Scenici

corum Fragmenta" (Halberstadt, 1824); or Klunmann's collection of the same (Jena, 1843), enriched by a life of N., and an essay on his poetry. See also Sellars's "Poets of the Roman Republic" (Edin. 1863).

**NÆVUS** (known practically as *mother-spot* or mole) is a congenital mark or growth on a part of the skin. Sometimes it is merely a dark discoloration of the surface as described in the article **MACULÆ**, in which case it is termed a mole and is perfectly harmless; but often it consists of a dense network of dilated blood-vessels, forming a reddish or livid tumor, more or less elevated above the surface of the surrounding skin. The most frequent situations of these vascular nevi are the skin and subcutaneous cellular tissue of the head; but they may occur elsewhere. The popular belief is, that they are caused by the longing of the mother during her pregnancy for a lobster, or strawberry or raspberry, or some other red-colored article of food, and that the influence of her mind has impressed upon the fœtus a more or less vivid image of the thing she longed for; and hence the name of *mother-spot*. Sometimes these tumors waste away spontaneously, and give no trouble; but frequently they increase rapidly, invade the adjacent tissues, and ulcerate or slough, and thus become dangerous to life by hæmorrhage. When these tumors do not shew a tendency to increase, no treatment is necessary. When they are obviously increasing in size, the continual application of cold (by means of freezing mixtures), with moderately firm pressure, is sometimes of service; but a more certain method is to employ means to produce such an amount of inflammation as to obliterate the vessels; for this purpose, the seton, the application of nitric acid, and vaccination of the tumor, have been successfully applied. The injection of strong astringents, with the view of coagulating the blood, has sometimes effected a cure. If all those means fail, extirpation, either with the ligature or knife, must be resorted to; the ligature being regarded as the safest and best method. For the various methods of applying the ligature, the reader is referred to any standard work on operative surgery. If the tumor is in an inaccessible spot, as in the orbit of the eye, and is increasing rapidly, the only course is to tie the large vascular trunk supplying it. The common carotid artery has in several instances been tied with success for vascular nævus in the orbit.

**NÄFELS**, a village of Switzerland, in the canton of Glarus, and five miles north of the town of that name, in a deep valley, is one of the most famous battle-fields in the country. Pop. (1870) 2490. Here, in 1388, 1500 men of Glarus, under Matthias am Buhl, overthrew an Austrian force of from 6000 to 8000 men. The event is still celebrated yearly.

**NA'FTIA**, Lago, a curious small lake in Sicily, about two miles from Mineo, in Catania. It is situated in a plain, amidst craggy hills, and is of a circular form, commonly sixty or seventy yards in diameter, and about fifteen feet deep, but in dry weather shrinking to a much smaller size, and being occasionally altogether dried up. In the midst of it are three small craters, two of which perpetually send up water in jets to the height of two or three feet; the third is more intermittent. The water is greenish, or turbid, and has an odor of bitumen. The whole lake resembles a boiling cauldron, from the escape of carbonic acid gas, rushing upwards with great force. The atmosphere is consequently fatal to birds attempting to fly across the surface of the lake, and to small animals which approach it to satisfy their thirst; and an approach to it is attended with headache and other painful circumstances to man himself. The ancients regarded these phenomena with great dread. They supposed that Pluto, when carrying off Proserpine, drove his fiery steeds through this lake, ere his descent to the lower regions. A temple was erected here to the gods of the two craters, the *Dii Palici*, who were supposed to be twin sons of Jupiter, by the nymph Thalia. Pilgrims flocked to this shrine; and it afforded an inviolable asylum to slaves who had fled from their masters. An oath by the *Dii Palici* was never broken by the master, who found himself compelled here to come to terms with his runaway slave. No remains of the temple of the *Dii Palici* are left, although it is described as having been magnificent.

**NAGA** is, in Hindu Mythology, the name of deified serpents, which are represented as the sons of the Muni Kas'apa and his wife Kadra, whence they are also called *Kādraveyas*. Their king is Śeṣha, the sacred serpent of Vishnu.

**NAGAPATA'M**, a seaport of British India, on the Coromandel coast, in the province of Tanjur, 15 miles south of Karikal. It was taken by the Dutch in 1680, but fell into the hands of the English in 1781. Its site is an open sandy plain, elevated only three or four feet above sea-level. The port is visited by small vessels, and carries on some trade with Ceylon. Pop. at the census of 1871, 46,525.

**NAGARJUNA**, or Nāgasena, is the name of one of the most celebrated Buddhist teachers or patriarchs—the thirteenth—who, according to some, lived about 400 years, according to others, about 500 years, after the death of the Buddha S'ākyamuni (i. e., 143 or 43 B.C.). He was the founder of the Mādhyamika school, and his principal disciples were Aryadeva and Budhapālita. According to the tradition of the Buddhas, he was born in the south of India, in a Brahmanical family. Even as a child, he studied all the four Vedas; later, he travelled through various countries, and became proficient in astronomy, geography, and magical arts. By means of the last, he had several amorous adventures, which ended in the death of three companions of his, but in his own repentance, and, with the assistance of a Buddhist mendicant, in his conversion to Buddhism. Many miracles are, of course, attributed to his career as propagator of this doctrine, especially in the south of India, and his life is said to have lasted 800 years.—See E. Burnouf, "Introduction à l'Histoire du Bouddhisme Indien" (Paris, 1844); Spence Hardy, "A Manual of Buddhism" (Lond. 1853); W. Wassiljew, "Der Buddhismus, seine Dogmen, Geschichte und Literatur" (St Petersburg, 1860).

**NAGASA'KI**, or Nansensiki, a city and port of Japan, opened to foreign commerce by the treaty of 1858, on the first July 1859, is situated in 32° 44' n. lat., and 139° 51' e. long., on the western side of a peninsula in the northwest of the Island of Kiusiu. Previously to 1859, it was the only port in Japan open to foreigners. The harbor, which is one of the most beautiful in the world, is about six miles in width, and three or four in length. To a person inside, it appears completely land-locked, and it is surrounded by hills of about 1500 feet in height. These are broken into long ridges and deep valleys; while the more fertile spots are terraced and under cultivation. The town of N., which is about a mile in length, and three-quarters of a mile in width, lies on the north side of the bay; its population is estimated at 70,000. The streets in general are clean and well-paved, but the houses are not particularly good, except those possessed by courtesans, and known as "tea-houses." On the hills behind the town are various temples, those dedicated to "Sinto," or the worship of the sun goddess, which is the old national religion of Japan, and those in which the Buddhist worship, imported from China, is followed. The foreign settlement lies to the south of the native town, the British, French, German, Prussian, and Portuguese, consulates occupying the hilly ground back from the bay. On the opposite side of the bay, the Japanese have a steam-factory, under the direction of Dutch officers, and close by is the Russian settlement. The climate of N. is genial but variable. The trade of N. is inferior to that of Kanagawa. Sea-weed, salt-fish, and other articles are exported to China. The exports to Europe are mainly tea, tobacco, coal, ginseng, vegetable wax, and copper. The chief imports are cotton piece-goods, woollen goods, sugar, oils. The total value of imports in 1875 amounted to 1,617,000 dollars, and of the exports to close on 2,000,000 dollars. The import trade suffers (according to the consular report of 1872) from the very confined outlet of this market, the absence of wealthy native merchants, and of all the banking facilities, both foreign and native, existing at Hiogo, Osaka, and Yokohama.

**NA'GELFLUE**, the provincial name for a bed of conglomerate belonging to the *Molasse* (q. v.), which forms a considerable portion of the strata in the central region of Switzerland, between the Alps and the Jura. It is said to attain the enormous thickness of 6000 and 8000 feet in the Rhigi near Lucerne, and in the Speer near Wesen.

**NAGESUR**, the name under which the blossoms of the *Mesua ferrea* are sold in the bazars of India. See *GUTTIFERÆ*.

**NAGPUR**, a city of British India, capital of the province of the same name, and situated near its north-west extremity, in an unhealthy swampy hollow, 430 miles in a direct line east-north-east of Bombay. Inclusive of its extensive suburbs,

Nagpur  
Nails

380

it is seven miles in circumference. It contains no important edifices. The great body of the inhabitants live in thatched mud-tents, interspersed with trees, which prevent the circulation of air, and secrete moisture, thus rendering the town unnecessarily unhealthy. The mean temperature of N. is estimated at about 80° F. Cotton cloths, coarse and fine chintzes, turbans, silks, brocades, blankets, woollens, tent-cloths, and articles in copper and brass, are manufactured. Here, on the 26th and 27th November 1817, a small British force of 1353 men, commanded by Colonel Scott, defeated a native army of 18,000 men. Pop. (1872) 84,441.

NAGPUR, an extensive inland province of British India, is under the chief commissioner of the Central Provinces. Its area is 22,843 square miles, and its population in 1872 was 2,280,081; but this designation has been used to include a much greater area. The north part of the province is mountainous in character, being traversed by spurs of the great Vindhya range; the general slope of the surface is from north-west to south-east, and the Bay of Bengal receives the drainage of the country chiefly through the rivers Māhānadīff and Wain Gangā—the latter a tributary of the Godāvāri. The climate is not healthy, and is especially insalubrious in the extensive tracts of low marshy land which abound in the province. The Gonds (see INDIA), supposed to be the aborigines, are the most remarkable class of the inhabitants. They rear fowls, swine, and buffaloes; but their country, forming the south-eastern tracts—about one-third of the whole—is covered with a dense jungle, swarming with tigers. In the more favored districts, where the inhabitants are more industrious, rice, maize, oil, and other seeds, and vegetables are extensively cultivated. The rajahs of N., sometimes called the rajahs of Berar, ruled over a state formed out of that part of the great Mahratta kingdom. The dynasty, however, died out in 1833 and the territory came into the possession of the British. The province has five divisions—capital, Nagpur.

NAG'S HEAD CONSECRATION. This story, which was first circulated by the Roman Catholics forty years after the event, with respect to Archbishop Parker's consecration, was to the following effect. On the passing of the first Act of Uniformity in the first year of Queen Elizabeth, fourteen bishops vacated their sees, and all the other sees excepting that of Llandaff being vacant, there was a difficulty in maintaining the hitherto unbroken succession of bishops from apostolical times. Kitchin of Llandaff refused to officiate at Parker's consecration, and consequently the Protestant divines procured the help of Scory, a deprived bishop of the reign of Edward VI., and all having met at the Nag's Head Tavern in Cheapside, they knelt before Scory, who laid a Bible on their heads or shoulders, saying: "Take thou authority to preach the word of God sincerely;" and they rose up bishops of the New Church of England! The story is discredited by the Roman Catholic historian Lingard, and is carefully refuted by Strype in his life of Parker. The facts of the case are, that the election took place in the chapter-house at Canterbury, the confirmation at St Mary le Bow's Church in Cheapside, and the consecration in the chapel of Lambeth Palace. Scory, then elected to the see of Hereford; Barlow, formerly Bishop of Wells, then elected to Chichester; Coverdale, formerly of Exeter, and never reappointed to any see; and Hodgkin, suffragan of Hereford, officiated at the consecration. The Nag's Head story probably arose from the company having possibly gone from Bow Church, after the confirmation, to take a dinner together at the tavern hard by, according to the prevailing custom. The due succession of bishops in the English Church has never been broken.

NAGY, a Hungarian word, meaning "great." It is prefixed to the names of many towns in Hungary and Transylvania. In the present work, many of the towns that take this prefix are given under the name that comes after it.

NAGY BA'NYA. See BANYA.

NAGY ENYE'D a small town of Transylvania, on the Maros, 17 miles north-north-east of Karlsburg. It contains a famous Calvinistic college. Pop. (1869) 5719.

NAGY KARÓLY (i. e., Great Karóly), a town of Hungary, capital of the county Szathmar, 37 miles east-north-east from Debreczin, on a small feeder of the Theiss. It has several important annual fairs, and a trade in corn and cattle. Pop. (1869) 12,754.

**NA'HUM**, one of the twelve minor prophets, was a native either of Elkosh, in Galilee, or the son of a man named Elkosh. The identification of his birthplace with Capernaum (Nahum's Village) or a place called Elkosh, on the east side of the Tigris, not far from Nineveh, is the result of vague speculation. He was probably a contemporary of Isaiah, and flourished about 713-711 B.C. The burden of his "vision" (in 3d chap.) is the destruction of Nineveh and the downfall of the Assyrian kingdom. His style is full of animation, fancy, and originality, and at the same time clear and rounded. His language throughout is classical, and in the purest Hebrew, belonging to the second half of Hezekiah's reign, or to the time immediately following the defeat of Sennacherib before Jerusalem (2 Kings xix. 35, &c.). A commentary on N., with special reference to the Assyrian monuments lately discovered, has been written by O. Strauss (Berlin, 1853).

**NA'IA**. See **AKF** and **COBRA**.

**NA'IADES**, Naiadaeae, or Potameae, a natural order of endogenous plants divided by some botanists into several orders (*Juncagineae*, *Zosteraceae*, &c.), containing in all not quite 100 known species, all aquatic plants, some of them inhabiting the ocean, some found in lakes and ponds, some in streams. They are all of very cellular structure; the leaves have parallel veins, and the flowers are inconspicuous. To this order belongs the Pondweed (*Potamogeton*), of which a number of species abound in the still waters of Britain, and of which some are found as far north as Iceland. To this order also belongs the **GRASSWRAKE** (q. v.) of our shores, used for stuffing mattresses. The Lattice-leaf (q. v.) of Madagascar is one of the most interesting species, and one of the few which attract notice as in any way beautiful.

**NA'IADES**, in Grecian Mythology, the nymphs of fresh-water lakes, rivers, and fountains. They were believed to possess the power of inspiration; hence, soothsayers and others are sometimes called *nympholeptoi* (seized by the nymph). They were represented as half-clothed maidens, and not unfrequently as companions of Pan, of Hercules, the patron of warm springs, or of the Sileni and the Satyrs, in whose jovial dances they join.

**NA'IAST**, or **Na'taut** (Lat. *natare*, to swim), a heraldic term applied to a fish when borne horizontally across the shield in a swimming position.

**NAIGUE**, or **Naik**, a native subaltern officer among Indian and Anglo-Asiatic troops, whose functions are somewhat analogous to those performed among European troops by the drill-sergeant.

**NAILS** are flattened, elastic, horny plates, which are placed as protective coverings on the dorsal surface of the terminal phalanges of the fingers and toes. Each nail consists of a *root*, or part concealed within a fold of the skin; a *body*, or exposed part attached to the surface of the skin; and a free anterior extremity called the *edge*. The skin below the root and body of the nail is termed the *matrix*, from its being the part from which the nail is produced. This is thick, and covered with highly vascular papillae, and its color is seen through the transparent horny tissue. Near the root, the papillae are smaller and less vascular; hence the portion of nail corresponding to this part is of a whiter color; from its form, this portion is termed the *lunula*. It is by the successive growth of new cells at the root and under the body of the nail that it advances forwards, and maintains a due thickness, whilst at the same time its growth in a proper direction is insured. The chemical composition of the nails is given in the article **HORNY TISSUES**, to which class of structures they belong. According to the observations of Beau, the finger-nails grow at the rate of about two-fifths of a line in a week, while the toe-nails only grow with about one-fourth of that rapidity. When a nail has been removed by violence, or has been thrown off in consequence of the formation of matter (pus) beneath it, a new nail is speedily formed, provided the matrix has not been seriously injured.

There is a very common and troublesome affection popularly known as *ingrowing nail*. Its most usual seat is by the side of the great toe. It does not in reality arise from any alteration of the nail, but from the adjacent soft parts being constantly pressed by the use of tight shoes against its edge. These parts become swollen and inflamed; suppuration ensues, and an intensely sensitive ulcer is formed, in which the nail is embedded. Surgical advice should at once be resorted to in these cases,

as there is no probability that the ulcer will heal spontaneously, especially if the patient continue to move about, and thus keep up irritation. In obstinate cases, it is not unfrequently necessary to remove a portion of the nail, an operation attended with much pain, although quickly performed.

**NAILS**, pointed pieces of metal, usually with flattened or rounded heads, used for driving into wood-work, for the purpose of holding the pieces together. A variety, in which the head is very large, and the spike portion small, used by shoemakers for protecting the soles of boots and shoes from wear is called the *shoe-nail*; another, which is made by cutting thin plate-iron into thin pointed pieces of various lengths, is called *brads*; these sometimes are without heads, but are usually made with a slight projection by way of a head. When made small, with flat heads, for attaching cloth or hangings in upholstery-work, they are called *tacks*; and when very large for heavy carpentry, *spikes*.

*Nail-making*.—Formerly, all nails were hand-made, by forging on an anvil; and in Britain and the north of Europe, vast quantities are still made in this manner, being preferable, for many kinds of carpenters' work, to those made by machinery. In France, the greater part of the nails used for light carpentry-work are made of soft iron wire, pointed with the hammer; and in order to head them, they are pinched in a toothed vice, which leaves the portion for the head projecting, and makes below it three or four grooves in the nail, which increase its hold on the wood when driven home. The head is beaten into a counter-sinking on the vice, which regulates the size.

The iron used for hand nail-making in Britain is sold in bundles, and is called *nail-rods*; it is either prepared by rolling the malleable iron into rods or small bars of the required thickness—which process is only employed for very fine qualities—or by cutting plate-iron into strips by means of rolling-shears; these shears consist of two powerful revolving shafts, upon which are fixed discs of hard steel with squared edges. The discs of one shaft alternate with those of the other; they are of the thickness of the plate to be cut, and the shafts are so placed, that a small portion of one set of the discs are inserted between those of the other set. When the shafts are revolving, a plate of iron is pressed between the discs, and it is forcibly drawn through, the steel discs cutting the plates into strips with great rapidity. The quantity produced in this way is enormous, some mills turning out at the rate of ten miles per hour of nail-rods.

Several inventions, in which America took the lead, have been introduced, and are successfully worked, for making nails direct from plate-iron, either by cutting them out cold or hot; and a very large proportion of the nails in use are made in this way. Nail-making by machinery was originated in Massachusetts in 1810.

**NAIN DE TILLEMONT**. See **TILLEMONT**.

**NAIRN**, in the county of the same name, is a royal, parliamentary, and municipal burgh, and is 15 miles north-east by rail from Inverness. It is situated at the mouth of the river Nairn, on the west side, and for that reason was anciently called *Inver-Nairn*. Lying on the southern shore of the Moray Firth, which is here about eight miles across, it commands a grand and extensive view of the coast of Ross-shire, including Cromarty Bay, nearly opposite. N. was regalsied by William the Lion. It has little historical interest, and few objects worthy of antiquarian attention. It is principally remarkable for the excellency of its sea-bathing and artificial baths, in which respect it is equal, if not superior, to any town in the north of Scotland, as a resort in summer. The temperature is mild and equable. The inhabitants enjoy a remarkable immunity from epidemic diseases. There is a commodious harbor. The town has a literary society, a museum, a newspaper, three branch banks, and a savings bank. It is conspicuous for good and cheap education. Pop. in 1871, 8751. N. unites with Inverness, Forres, and Fortrose in sending a member to parliament.

**NAIRNSHIRE** is bounded on the n. by the Moray Firth, and on its other sides by the counties of Inverness and Moray, of the latter of which it anciently formed a part. It extends north and south 22 miles, and 15 miles from east to west. Its area is 21½ square miles, or 137,500 acres, of which about 26,000 are under cultivation. Pop. in 1871, 10,225, including the burgh of Nairn. Along with Elginshire, it returns one member to parliament. Constituency (1876—1877), 263; rental, £34,941. Nairn is

the only royal burgh in the county, but there are the villages of Cawdor and Auldern. The soil is for the most part light and sandy. There is, however, considerable agricultural activity, though the county is perhaps better known for its cattle-breeding. An important cattle "tryst" is held at Cawdor once a month during the greater part of the year. The climate of this country is distinguished for its salubrity, and the temperature is remarkably equable. The thermometer in the shade has not risen above  $78^{\circ} 8'$ , or fallen below  $11^{\circ} 2'$ , during the last twenty years. According to the latest observations, the yearly rainfall did not amount to more than 26 inches, the greatest fall being in October, and the least in April. At Brackla Distillery, which belongs to Robert Fraser, Esq., from 40,000 to 50,000 gallons of spirits are manufactured annually. The river Nairn runs through the county in a beautiful valley, which presents particularly attractive and romantic scenery in the neighborhood of Cawdor Castle, one of the residences of the Earl of Cawdor. This castle is of uncertain antiquity, and is in an excellent state of preservation. It was the residence of the ancient Thanes of Cawdor, one of whom is mentioned in "Macbeth." About the year 1510, the estates belonging to the earldom passed by marriage from the old family of Calder into the hands of a son of the Duke of Argyll, and are still in the possession of his descendants. Not a few other objects of antiquarian interest are to be found in the county of Nairn.

NAISSANT, a term applied in heraldic blazon to an animal depicted as coming forth out of the middle—not like *Issuant* or *Jessant* (q. v.), out of the boundary line—of an ordinary.

NAKHICHEVAN, on the Don, a thriving town of South Russia, in the government of Ekaterinoslav, on the right bank of the Don, and near the mouth of that river, two miles east of Rostov. It was founded in 1779 by Armenian settlers from the Crimea, and has (1867) 16,584 inhabitants, mostly Armenians, belonging to the Greek-Armenian Church. The inhabitants are engaged in the manufacture of silver ornaments and woollen goods, and an extensive trade is carried on.

NAKSHATRA (a Sanscrit word of doubtful etymology, but probably a compound of an obsolete base *naksha*, night, and *tra*, protecting, i. e., literally night-protecting) means properly star, and is used in this sense in the Vedas. At a later period, it was applied to the asterisms lying in the moon's path, or to the mansions in which the moon is supposed to rest in her, or rather, according to Hindu notions, *his* path. The number of these asterisms was reckoned originally at 27, later at 28; and mythology transformed them into as many daughters of the patriarch Daksha, who became the wives of the moon. See MOON. Biot, the distinguished French astronomer, endeavored to shew that the Hindu system of the Nakshatras was derived from the Chinese *shen*; but his theory, though supported by very learned arguments, has been refuted by Professor Whitney, in his notes to Burgess's translation of the "Sūrya-Siddhānta" (New Haven, United States, 1860), and by Professor Müller in his preface to the 4th volume of the "Rig-Veda" (Lond. 1862); for their arguments leave little doubt that the system of the Nakshatras originated from the Hindu mind.

NALA is a legendary king of ancient India—a king of Nishadha—whose love for Damayanti, the daughter of Bhīma, king of Vidarbha, and the adventures arising from, or connected with, it—the loss of his kingdom, the abandonment of his wife and children, and their ultimate restoration—have supplied several Hindu poets with the subject of their muse. The oldest poem relating to Nala and Damayanti is a celebrated episode of the "Mahābhārata" (q. v.), edited both in India and Europe, and translated in Latin by Bopp; in German by Kosegarten, Bopp, Rückert, and Meier; and in English by Dean Milman. The two other renowned poems treating of the same legend, but with far less completeness, are the "Nalodaya" (q. v.) and the "Naladhacharita" of Śrī-Harsha.

NALODAYA is the name of a Sanscrit poem which is highly prized by the modern Hindus. Its subject is the story of Nala (q. v.), but more concisely narrated than in the episode of the "Mahābhārata," whence its contents are borrowed; and its reputed author is Kālidāsa (q. v.). Great doubts, however, must attach to the attribution of this authorship, if by Kālidāsa the author of "Śākuntala" is meant, and not some other poet bearing the same name; for the merits of this poem consist neither in elevation of thought nor in richness of fiction: they are sought for by the

**Namaqua** and  
Name

. 384

Hindus in its elaborate and artificial diction, and in its alliteration of every variety, which, to a European mind of culture and taste, would be no more than an intolerable jungle of sounds, devoid of all poetical worth. The text of the poem, with a modern commentary, has been edited (Berlin, 1830) by F. Benary; and (Calcutta, 1844) by W. Yates, who added to his edition a free metrical translation of the text, and an essay on Sanscrit Alliteration.

**NAMAQUALAND, Great.** The extensive region in South Africa north of the Cape Colony, extending from the Orange River, lat.  $29^{\circ} 30'$ , to Walfish Bay, lat.  $23^{\circ}$ , and stretching inland from the west coast to the Kalihari Desert, comprehending an area of about 100,000 square miles, is known under the name of Great N., being principally inhabited by wandering tribes of Namaquas, (q. v.). This region is drained principally by a large periodical water-course, called the Onp, Borradsale, or Great Fish River, which, running from north to south a distance of about 450 miles, joins the Orange River nearly at right angles, about 90 miles from its mouth. It is generally, except in its northern parts, where the country rises into extensive and lofty plateaus, a most sterile and barren region, and along a coast-line of upwards of 400 miles does not present a single running stream, much less a navigable river, although a few little bays along the coast, such as Augra Pequena, Sandwich Harbour, and Walfish Bay, afford safe anchorages. The valley of the Onp is bounded on each side by ranges of flat-topped barren mountains, which to the eastward die away into the waterless though wooded flats of the Kalihari Desert, and coastwards stretch into vast sandy downs, against which the Southern Atlantic beats an unceasing surf, rendering landing very dangerous, and enveloping the coast in a perpetual mist. The chief productions of the region are cattle, for the rearing of which the country seems favorable. On the edge of the Kalihari, ivory and ostrich feathers are collected, and copper ore seems abundant in several localities. Guano is found at Ichaboe and many little islands on the coast, and considerable fisheries are carried on by Cape houses in many of the bays.

The lion, giraffe, rhinoceros, hippopotamus, and large game generally, are still found in N., although fast diminishing before the firearms of the Namaquas. The snakes are considered especially venomous. The gemsbok, eland, and other large antelopes, now almost unknown in the Cape Colony, are still numerous in the little-frequented wastes of this region. The climate is extreme, and though, on the whole, not unhealthy, is very trying to European constitutions. The water is generally brackish. The first English traveller in N. was Sir J. Alexander, who, in 1837, traversed it from north to south. Charles John Anderson has also explored every part of it. Information on the region may be also found in the travels of Moffat, Campbell, and Le Vaillant. The native tribes, who may perhaps number about 40,000 souls, speak the Namaqua language, the purest type of the Hottentot.

**NAMAQUALAND, Little,** is a division of Cape Colony south of the Orange River, formerly part of the district of Clanwilliam, and included with the country north of it under the general name of Namaqualand. It is a very barren region, covered with rugged volcanic-looking hills, through which the Gariep or Great Orange River appears, through some convulsion of nature, to have forced its way to the sea. Little N. has of late years afforded a very large supply of copper ore of excellent quality (in 1878 near 12,000 tons); but the mines, although well known to the Dutch 200 years ago, were not worked till after 1852. The principal river is the Orange of the colonists, which divides the Cape Colony from Great Namaqualand; all the other streams are merely periodical torrents, often dry for years. The seat of magistracy is at Springbok Fontein, about 80 miles from the principal harbor, Hondeklip Bay, and where are situated the very rich mines of the Cape Copper Company. Many scattered tribes of Namaquas and Bastard Hottentots roam along the bank of the Orange River; and in the neighborhood of the mines are numerous Dutch farmers and English settlers. All the larger mammalia, except a few gemsbok, are extirpated; but troops of ostriches are still numerous on the grassy flats of the Bushman country. The geological features of this region are peculiarly interesting, and have been thoroughly explored by A. Wylie, on behalf of the Cape government. The rocks are generally of granite or gneiss, intersected with numerous veins of cupreous indications, and near the Orange River, present many very curious features. The coast-line extends for 100 miles, with a few little bays,

such as Port Nolloth and Hondeklip, where there is tolerably safe anchorage, and generally presents a shore covered with low granite rocks. At Hondeklip Bay, a large boulder painted red forms a distinguishing landmark.

**NAMA'QUAS**, the principal existing tribe of the race generally known under the name of Hottentot. They inhabit the region called Great Namaqualand, north of the Gariep or Orange River, and the country a few miles south of it, as far as the Kamiesbergen. They are a pastoral people of rather predatory habits, and live under the rule of their chiefs, whose powers, however, are of a very limited nature. Differing from the Bosjesmen Hottentots, the N. are a tall, well-made, active people, although presenting the usual peculiarities of the race, such as the light olive complexion, the oblique eye, and short tufted hair. They speak a dialect of the Hottentot language, which, however, differs considerably from that used by other tribes of that people. Mission stations of the Rhenish and Wesleyan societies have been for many years established amongst them, and in a few localities, near the Cape Colony, with considerable success; and the New Testament and some elementary works have been translated into the Namaqua dialect. On the northern borders of the regions they inhabit, the N., under the chief Afrikaner, the descendant of a fugitive slave from Cape Colony, have for many years kept up a predatory and bloody war with the tribes of Ovampos and Damaros, who live north of Walfish Bay. The total number of N. cannot exceed between 50,000 and 60,000 souls, scattered over a region of at least 150,000 square miles; and there is every prospect of the pure Hottentot tribes soon becoming extinct, or at least absorbed, being gradually supplanted by the more energetic and civilised Bastard races, who, in point of civilization and appearance, are very little inferior to the ordinary Dutch Boer of Cape Colony. Many of the southern N. possess wagons and oxen, and are employed in the transport of copper ore from the mines of Little Namaqualand to the shipping port at Hondeklip Bay.

A few of the peculiar customs of the Hottentot tribes, described by Kolben nearly 200 years ago, may be still traced amongst the more remote tribes of the N.; but contact with the Cape Colonists, and the efforts of the missionaries, have partially civilised this race, so that an ordinary Hottentot is quite as respectable a savage, or perhaps more so than his Boijouarn or Amakosa brethren.

**NAMAYCUSH** (*Salmo namaycush*), a fish nearly allied to the salmon and trout, a native of the great lakes and interior rivers of North America. It is often taken of a size varying from 20 to 40 lbs., and is said sometimes to reach 60 lbs. It is much esteemed for the table. It is caught at the same fisheries with the still more prized Whitefish (q. v.).

**NAME** (Sax. *nama*, Ger. *name*, Lat. *nomen*, Gr. *onoma*), the word by which a particular person or things is signified in distinction from other persons or things. A name attached to a person is called a proper name. Names distinguishing one individual from another have been in use from the earliest ages of human society. Among the Jews, the name given to a child either originated in some circumstance of birth, or was an expression of religious sentiment. Old Testament names are almost all original—i. e., given in the first instance to the person bearing them; but the Jews, like other nations, after accumulating a considerable stock of names, began to repeat them, and to find few names in the New Testament which had not been used before. In Old Testament times, it was an occasional practice to adopt a change of name on the occasion of an important event in one's life.

The Greeks bore only one name, given on the tenth day after birth, which it was the right of the father to choose, and alter if he pleased. The earliest Greek names are generally expressive of some quality in high estimation, as valor, skill, wisdom, or gracefulness (Callimachus, excellent fighter; Pherecrates, strength bringer; Sophron, wise; Melanthus, black flower). In later times, when the faith in the gods was on the wane, names, derived from Apollo and Athene, or indicative of the favor of Olympus (Apollodorus, gift of Apollo), came more into fashion. The eldest son generally bore the name of his paternal grandfather, and the confusion arising from the repetition of the same name was attempted to be obviated by appending the father's name (either simply, or turned into a patronymic), the occupation, the place of birth, or a nickname.

The Romans at a very early period bore two names, and afterwards every Roman

citizen had three. The *prænomen*, like our Christian name, was personal to the individual—Caius, Marcus, Cneius; in writing generally abbreviated to an initial or two letters, C., M., or Cn. It was given in early times on the attainment of puberty, and afterwards on the ninth day after birth. There were about thirty recognised *prænomina*. Women had no *prænomen* till marriage, when they took the feminine form of that borne by their husband. Every Roman citizen belonged both to a *gens* and to a *familia* included in that *gens*. The second name was the *nomen gentilitium*, generally ending in *-ius*, *-eius*, or *-aius*. The third name was the hereditary *cognomen* belonging to the *familia*. *Cognomina* were often derived from some bodily peculiarity, or event in the life of the founder of the family. A second *cognomen*, or *agnomen*, as it was called, was sometimes added by way of honorary distinction. In common intercourse, the *prænomen* and *cognomen* were used without the *nomen gentilitium*, as C. Cæsar for C. Julius Cæsar, M. Cicero for M. Tullius Cicero. The Roman names were in their origin less dignified and aspiring than the Greek; some were derived from ordinary employments, as Porcius (swineherd), Cicero (vetch grower); some from personal peculiarities, Crassus (fat), Naso (long-nosed); a few from numerals, Sextus, Septimus.

The Celtic and Teutonic names, like the Jewish and Greek, had been originally very significant; but at an early period their exuberance became checked; people contented themselves with repeating the old stock. While the speech of Europe was undergoing a transformation, the names in use remained the same; belonging to an obsolete tongue, their signification by and by became unintelligible to the people using them. Many are derived from "God," as Gottfried, Godwin; some from an inferior class of gods known by the title *as* or *ana*, whence Anselm, Oscar, Esmond; others from elves or genii, Alfred, Alboin, Elfric (Elf King). Bertha is the name of a favorite feminine goddess and source of light, from the same root as the word "bright;" the same word occurs as a compound in Albrecht, Bertram. To a large class of names indicating such qualities as personal prowess, wisdom, and nobility of birth, belong Hildebrand (war brand), Konrad (bold in counsel), Hlodwig (glorious warrior), called by us Clovis, and the original of Ludwig and Louis. The wolf, the bear, the eagle, the boar, and the lion entered into the composition of many proper names of men, as Adolf (noble wolf), Arnold (valiant eagle), Osborn (God bear). Respect for feminine prowess also appeared in such names as Mathilde (mighty amazon), Wolfhilde (wolf heroine). The spread of Christianity threw a number of the old names into comparative oblivion, and introduced new ones. The name selected at baptism was more frequently taken from the history of the Bible or the church than from the old traditional repertory, which, however, was never altogether disused. Many names, supposed to be local and very ancient, particularly in the Scottish Highlands, Wales, and Cornwall, are in reality but corruptions of names of Christian origin which are in use elsewhere. Owen, Evan, and Eoghau (the latter often Anglicised into Hector) seem all to be forms of John or John. A change of name was sometimes made at confirmation.

Periods of religious and political excitement have had a very powerful influence in modifying the fashion in names. The Puritans would only admit of two classes of names, those directly expressive of religious sentiment—Praise-God, Live-well—and names which occur in Scripture; these latter indiscriminately made use of, however obscure their meaning, or however indifferent the character of the original bearer of them. Old Testament names were used in preference to New, probably because they did not convey the notion of a patron saint. Old Testament names still prevail largely in America, where exists a medley of Christian names from all possible sources. At the French Revolution, names supposed to savor of either loyalty or religion were abandoned, and those of Greek and Roman heroes came into vogue instead. The Augustan period of English literature gave a temporary popularity to such feminine names as Narcissa, Celia, Sabina. In Germany, the names in use are particularly free from foreign admixture; they are almost all either of Teutonic origin, or connected with the early history of Christianity. In Britain, the number of names has, particularly since the Reformation, been more limited than in most other countries. In some families of distinction, unusual names have been handed down from father to son for centuries—e. g., Penrhyn among the Berties, and Sholto in the Douglas family. The accumulation of two or more Christian names only became common in the present century, and another

practice which has gained ground in Britain is the use of surnames as Christian names. More recently, various old names, particularly feminine names, as Mand, Florence, Ethel, have been withdrawn from their obscurity, and resuscitated.

The use of fixed family *surnames* cannot be traced much further back than the latter part of the 10th century. They first came into use in France, and particularly in Normandy. At the Conquest, they were introduced into England by the Norman adventurers, and were general at the Domesday Valuation. Many of the followers of William had taken names from their paternal chateaux or villages on the other side of the Channel, names which were used with the French preposition *de* before them. Their younger sons and others applied the "*de*" to estates awarded to them as their portion of the conquered country, and called themselves De Hastings, De Winton, &c., a prefix probably never in vernacular use in England, and completely discarded with the disappearance of Norman-French, unless in a few cases where it was retained for the sake of euphony, or from coalescing with the initial vowel, as in De la Bèche, Danvers (d'Anvers), Dangerfield (d'Angerville). When English was used in place of Norman-French, the "*de*" was always rendered into "*of*." The affectation of resuming it in recent times is as unwarrantable in theory as in taste. Such a designation as Lord De Tabley of Tabley House is an unmeaning tautology. The Scotch have a more expressive designation when they say Colquhoun of that ilk. In France and Germany, a territorial surname (denoted by "*de*" or "*von*") came, when surnames spread to all classes, to be the mark of nobility, so much so that in later times, when any one was ennobled by the sovereign, the "*de*" was prefixed to his previously plebeian and not territorial name. In Britain the "*de*" was never considered the test of nobility; the names of some of the most distinguished families were not territorial—e. g., Stewart, Butler, Spencer. In Scotland, surnames were hardly in use till the 12th c., and were for a long time very variable. The assumption of surnames by the common people is everywhere of much later date than their use by noble (gentle) families. As yet they can hardly be said to be adopted by the people of the wilder districts of Wales.

There are many existing local surnames in Britain besides those derived from the names of the manors of the gentry or landholders. Farms, homesteads, the natural features of the country, all gave their names to those who resided at or near them; hence such names as Wood, Marsh, Dale. The preposition "*at*" is in a few cases retained, as in Atwood, A'Court, Nash (atten-ash, i. e., at the ash). The travelling habits of the Scots account for such names as Inglis, Fleming, Welsh (the original of Wallace), applied to those who had visited foreign parts; and sometimes a Scotsman, wandering into England, returned with the acquired name of Scott.

A large class of surnames are patronymics, often formed by "*son*," or its equivalent in the language of the country, added to the Christian name of the father. Names of this sort often fluctuate from generation to generation. Alun Walterson had a son, Walter, who called himself Walter Alanson. The genitive case of the father's name sometimes served the same purpose, as Adams, Jones; and similarly in Italian, Dosso, Dossi. A fashion of using "*Fitz*," the equivalent of "*son*," before the ancestral name, as in Fitzherbert, prevailed temporarily in Normandy, whence it was imported into England. In the Highlands of Scotland, the prefix "*Mac*" (Macdonald) served the same purpose, which, however, fluctuated far longer than the patronymic surnames of England and the Lowlands; so also the "*O*" (grandson) of the Irish (O'Neill), and "*Ap*" of the Welsh (Ap Rhys, otherwise Apreece). The "*de*" of France had sometimes a similar origin, as in d'André, d'Hugues; and still more frequently the "*de*," "*dei*," or "*degli*" of Italy—di Cola, di Giacomo.

Office, occupation, or condition, gives rise to surnames—e. g., Knight, Marshall, Pace, Smith, Brewster, Shepherd; in Germany and Holland, Rauber and de Rogver (robber); and from such appellatives, patronymics may be again derived; thus, we have Smithson, de Maître (master's son), M'Nab (son of the abbot), M'Pherson (son of the parson), del Sarto (son of the tailor), &c. So also personal qualities—Black, White, Strong, Stark, Lang (long), Littlejohn, Crinkshanks; and nicknames have not infrequently been perpetuated as surnames. We have also surnames derived from the signs and cognizances which were borne in the middle ages, not only by fairs and shops, but by private houses. John at the Bell became John Bell; at Midleberg, in Holland, Simon, apothecary in the "Drake," or Dragon, became Simon Drack; hence, probably, the frequency of family names derived from animals, and

also of those beginning with "Saint," though this last class may, perhaps, sometimes have had its origin in the first owner of the name dedicating himself to the service of the saint in question. In Scotland and Ireland, "The" is a distinctive title borne by the heads of some old families—as "The Chisholm," "The O'Connor Don." In the Highlands of Scotland, the chief of a clan is usually addressed by the name alone in a marked manner: thus, "Macleod" implies specially Macleod of Dunvegan, in Syke, head of the clan Macleod; "Makinintosh," in like manner, applies solely to Mackintosh of Moy, in Inverness-shire.

In England, the number of existing surnames approaches to 40,000, or about one to every five hundred individuals; in Scotland, there are far fewer surnames in proportion to the population. The remarkable predominance of certain surnames in certain localities—as Campbell, Cameron, Macleau in Argyshire, Macdonald in Inverness, Mackay in Sutherland, Gordon and Forbes in Aberdeenshire, and Scott, Ker, Elliot, Maxwell, and Johnstone on the borders—arises from the clansmen having made a practice of taking the name of their chiefs, considering themselves members of their family by adoption, if not otherwise. Elsewhere than in Scotland, vassals often adopted the names of their lords, and servants those of their masters. Two or more surnames are often borne by one individual, in which case the paternal surname is sometimes placed first, sometimes last; and, in recent times, it is by the name which occurs last that the bearer of the two surnames is most frequently known.

The wife, with us at least, changes her surname to that of her husband on marriage. In the continent, it is not unusual for the husband to append his wife's name to his own; and in Spain, the wife retains her own name, while the son is at liberty to use either paternal or maternal name as he pleases, the choice generally falling on the best family.

*Change of name.*—Prior to the Reformation, surnames were less fixed than they have since become. Occasionally, younger sons, instead of retaining their patronymic, adopted the name of their estate or place of residence. A great matrimonial alliance was a frequent cause for adopting the patronymic of the wife. With the clergy, ordination was a common occasion of a change of name, the personal surname being exchanged for the name of the place of birth—thus, William Louge became William of Wykeham. In time of political troubles, a new name was often assumed for concealment; and in Scotland, the name of M'Gregor was proscribed in 1664 by an act of the privy council. In modern times, injunctions in settlements of land, and deeds of entail, are frequent grounds for a change of name, it being made a condition that the devisee or disponent shall assume a certain surname under penalty of forfeiture, a stipulation which the law recognises as valid. Such an obligation is often combined with one relative to arms. In a Scotch entail, it is a very frequent condition that each succeeding heir of entail, or husband of an heiress of entail, shall assume the entailor's name and arms, or his name and arms *exclusively*; in the former case, he may, if he pleases, continue to use his own surname along with the assumed one. The heir of entail is not held legally to take up any arms not otherwise his own, unless he have applied to the heraldic authorities for leave so to do. Where a Scotch entail contained an injunction to bear arms which had no existence in the official record of arms, the condition has not been held to be null; the heir of entail must apply to the Lord Lyon for a grant of arms bearing the designation of those disposed. In England, it used to be common to obtain a private act of parliament to authorise one to change his surname; and authority for such a proceeding has generally been given in later times by royal licence, which is granted only on a reasonable ground being established for the alteration, to the satisfaction of the kings-at-arms, to whom a remit is made. It has sometimes been supposed that this royal licence is necessary to legalise such a change, but the highest legal authorities have laid it down that there is nothing in the law of England to prevent any one, who may consider it for his interest so to do, to change his surname, or even his Christian name. The idea, lately prevalent to some extent, is equally erroneous, that an advertisement in a gazette or newspaper, or the execution of some deed, is a necessary form in order to effect a change of name. There are always great inconveniences in changing one's name, which sufficiently account for the general indisposition to do so, except from a questionable motive. As there is no law to prevent a person from changing his

name, so there is, on the other hand, no law to compel third parties to use the new name, and disputes and annoyances arising from such a state of things are matters of course. The change tends to a certain extent to destroy the means of identification after the lapse of years, which may or may not be the object desired. Notwithstanding these difficulties and inconveniences, there are many examples of persons who have succeeded after a few years in being generally known under a new name, and of the public as well as his friends recognising it. The change of name, in general, produces no change whatever on the legal status. A party is equally punishable for swindling, larceny, and other cognate offences, whatever name he uses; and, on the other hand, if he is legat-e, he is not prevented from establishing and receiving his legacy, whatever name he has adopted. It follows from what precedes that no person is punishable for using a new name, though it is sometimes an ingredient for a jury to take into consideration when they are required to infer a particular motive of conduct. The royal licence is practically required to be obtained by Englishmen (not Scotchmen) holding commissions in the army, as also when the change of name is to be accompanied by a change of arms, it being the practice of the English Heralds' College to refuse to grant arms corresponding to such change, unless the royal licence have been obtained. In Scotland, a *bona fide* change of name requires neither royal, judicial, nor parliamentary authority, the sole exception being the case of members of the College of Justice, who require the permission of the Court of Session. A royal licence is not generally applied for by natives of Scotland, as it is not required to be produced to the Lord Lyon on applying for a corresponding change of arms. The arms will generally be granted when the Lord Lyon is satisfied that the change has been made on some reasonable ground, and not from a purely capricious motive; and the fact of the change of name, with the reason why it has been made, are narrated in the new patent of arms. When such change of surname and corresponding change of arms has been made by a Scotsman who is an officer in the army, the authorities of the War Office are in the habit of requiring a certificate from the Lyon Office to the effect that the change is recognised there.

*Names of places.*—These, like names of persons, belong, in a great measure, to the language of past races. All over Great Britain, a very large proportion are derived from the Celtic names for natural features of the country. From *Gwyng*, *afon*, *lawn*, *llyn*, *cydyl*—in the Celtic speeches equivalent to *water* or *river*—we have Eak, Avon, Wye, Thames, Tavy, Clyde. *Pen* or *Ben*, hill, gives rise to the names of hills in England and Wales (Penrhye, Peuzance), and still more in Scotland (Ben Nevis). So, also, *cwm*, *comb*, valley—as in Cumberland, land of valleys. The memory of the Roman invasion has been preserved in the termination *-chester* (derived from *castra*) in the names of towns, as Manchester. Though surnames often originated in local names, the reverse process also occurred; as where *vill*, *ton* or *ington*, *ham* or *burgh*, has been appended to the name of the owner of the land, e. g., Charleville, Johnston, Wymondham, Edinburgh (i. e., Edwin's burgh).

See Pott's "Die Personennamen und ihre Entstehungsarten" (2 vols., 1858; 2d ed. 1860); Miss Yonge "History of Christian Names" (Lond. 1863); Lower, "On English Surnames" (Lond. 1849); Professor Innes, "Concerning Some Scotch Surnames" (Edin. 1860).

NAMUR, a province of Belgium, bounded on the n. by Brabant and Liège, e. by Luxemburg, w. by Hainault, and s. by France. Area about 1400 square miles. Pop. (December 1874) 819,336. The principal rivers are the Meuse—which entirely intersects the province—the Sambre, and the Lesse. N. presents generally an alternation of fruitful valleys and low hilly tracts; but in some parts, where the heights constitute offshoots of the Ardennes, and are densely wooded, they attain a considerable elevation. With the exception of the land in the south-west, where there are large tracts of bog and heath, the soil is extremely rich, yielding abundant crops and fine pasture. The chief products of N. are wheat, oats, hops, oil yielding plants, and flax. Besides iron, copper, lead, and coal mines, N. has marble and slate quarries, and yields sulphur, alum, cadmium, alumina, flints, &c. It has good steel, iron, and smelting works, breweries, paper-mills, &c. N. is divided into the three arondissements of Namur, Dinant, and Philippeville. At the close of the 12th c., N. was united to Luxemburg, after having existed as an independent countship for upwards of 150 years. Towards the middle of the 18th c., it passed by purchase to the

Namor  
Nanking

390

House of Flanders, which retained possession of it till 1430: when, on the death of Count John III., without direct heirs, the countship, which was in a state of extreme financial embarrassment, was purchased for 132,000 gold ducats, by Philip the Good, Duke of Burgundy, and subsequently shared the fate of the other Burgundian states.

NAMUR (Flem. *Namen*), the chief town of the province of the same name, is situated at the confluence of the Sambre with the Mense, and is a strongly fortified town and the seat of a bishop. Pop. in 1876, 25,066. Among its seventeen churches, the cathedral, or St Aubin's, which was consecrated in 1172, is one of the most beautiful churches of Belgium. M. has an academy of painting, a conservatoire for music, two public libraries, a museum, and hospital for aged paupers, a theological seminary, and two colleges, one conducted by Jesuits. The present citadel was constructed in 1754, but the city has been fortified from the earliest period of its history; and in 1692, its defensive works were repaired and strengthened by Coehoorn, only, however, to be taken in the following year by Louis XIV. and Vauban, the latter of whom added considerably to its original strength. The reputation of its citadel made N. a prized stronghold in every war of later times; and after having been gallantly defended by its French conquerors, in 1815, against the Prussians under Pirch, it was finally restored to the Netherlands after the battle of Waterloo, and at once put into thorough repair. N. is noted for its cutlery, its leather-works, and its iron and brass foundries.

NA'NAS, a town of Hungary, in the midst of extensive morasses, about 110 miles east-north-east from Pesth. The population, partly Protestant and partly Roman Catholic, is employed in cattle-husbandry and agricultural pursuits. Pop. 11,300.

NANA SAHIB, a Hindu, one of the leaders of the sepoy revolt of 1857. He was said to be the son of a Brahmin from the Deccan, and his real name was Dindaia Pant. He was born about 1820, and was adopted as a son in 1827 by Bajee Rao, the childless ex-pelshwa of Poona, thereby, according to Hindu law and custom, acquiring most of the rights of a legitimate son. He was educated as a Hindu nobleman—taught English, and brought much in contact with the European officers, in whose amusements he seemed fond of participating. A decision was, however, come to by the government of Calcutta, that they should not recognise rights to pensions or indemnities acquired by adoption; and in consequence, N. S. was refused the continuance of a pension of eight lacs of rupees, paid to his adopted father under a treaty made in 1818. This is believed to have rankled in his mind, along with slights he received from the supercilious English youth with whom he came in contact. He was allowed to retain some of the state of a native prince—a retinue of 200 soldiers, with 3 field-pieces, and a fortified residence at Bithoor, 10 miles west of Cawnpore. When the mutiny broke out in May 1857, he offered to assist the English, but instead, he treacherously placed himself at the head of the mutineers. The European troops were induced, on the 25th of June, to capitulate to N. S., who promised they should be sent down the Ganges in safety. They got on board boats provided for them, but had no sooner done so, than two guns were unmasked, and a murderous fire was opened upon them. The sepoys were ordered to shoot the men, but to spare the women and children, who, when their husbands and parents had been shot, were removed to a house in Cawnpore. On the 15th July, Sir H. Havelock, who had advanced to their assistance from Allahabad, defeated the sepoys in two engagements, one within 8 miles of Cawnpore; and N. S. next day directed that the women and children should be put to death, an order carried out with unparalleled atrocity. A long series of engagements against N. S. followed, in which he was always the loser, and he was ultimately driven beyond the English frontier into Nepal. In 1860, his death was announced, but two years later, new movements were discovered, which were attributed to him, and it is not certainly known whether he is dead or alive. Several persons have been arrested on suspicion of being N. S., but in all cases a mistake has been made. A column has been erected at Cawnpore in memory of those who perished in the massacre.

NANCY, a beautiful town of France, capital of the department of Meurthe-et-Moselle, is situated on the left bank of the river Meurthe, at the foot of wooded

and vine-clad hills, 220 miles east of Paris, on the Paris and Strasburg Railway. Pop. (1876) 66,303. It is divided into the old and new towns (the former irregular and with narrow streets, the latter open and handsome), and comprises also two suburbs. It contains many handsome squares and imposing edifices, and owes much of its architectural ornamentation to Stanislaus Leczinsky, who, after abdicating the crown of Poland in 1735, continued to reside here as Duke of Lorraine till his death, in 1766. His statue stands in the Place Royale, a fine square, surrounded by important public buildings, as the Hôtel de Ville, theatre, &c. The gates of N. look more like triumphal arches than the ordinary entrances of a town. Among the institutions are the university-academy, the normal school, the school of medicine, the lyceum, the public library, and numerous art and scientific societies. Cotton, woollen, and linen manufactures are carried on; but the principal branch of industry is the embroidering of cambric, muslin, and jaconet goods. N. is known to have existed in the 11th c. Two centuries later, it became the capital of the Duchy of Lorraine (q. v.). Charles the Bold was killed while besieging N. in 1477.

NA'NDU, or American Ostrich (*Rhea*), a genus of South American birds allied to the ostrich, cassowary, and emu, and most nearly to the ostrich, from which it differs in having the feet three-toed, and each toe armed with a claw; also, in being more completely feathered on the head and neck; in having no tail; and in having the wings better developed and plumed, and terminated by a hooked spur. The wings are indeed better developed than in any other of the *Struthionidae*, although still unfit for flight. The neck has sixteen vertebrae. There are at least three species. The best known species (*R. Americana*) is considerably smaller than the ostrich, standing about five feet high. It is of uniform gray color, except on the back, which has a brown tint. The male is larger and darker colored than the female. The back and rump are furnished with long feathers, but of a more ordinary kind than those of the ostrich. This bird inhabits the great grassy plains of South America, southward of the equator, abounding on the banks of the La Plata and its more southern tributaries, and as far south as lat. 42° or 43°. Its range does not extend across the Cordilleras. It is generally seen in small troops. It runs with great celerity, using its wings in aid. It is polygamous, one male securing possession of two or more females, which lay their eggs in a common nest, or drop them on the ground near the nest, to which the male rolls them. Contrary to the usual habit of birds, incubation is performed by the male. The N. is shy and wary, but is successfully hunted by the Indians, generally on horseback. The flesh of the young is not unpleasant. The N. is capable of being domesticated.—A smaller and more recently-discovered species (*R. Darwini*) has light-brown plumage, each feather tipped with white. It inhabits Patagonia. A third species (*R. macrorhyncha*) is distinguished by its large bill.

NANKEEN CLOTH. Calico of the kind called "nankeen" or nankin, was formerly imported extensively from China to Europe, and said to be the manufacture of Nanking; the color, a yellowish-buff, being a favorite one. It was supposed that the Chinese held a secret for dyeing this color, which was found to be remarkably durable; but it became known that it was not an artificial color at all, the cloth being made of a colored variety of cotton, which was produced occasionally in China and India. Artificially dyed nankeen cloths now form a considerable export from England to China.

The color of artificial nankeen cloth is produced by an elaborate process, in which the yarn or cloth is first dipped in a saturated solution of alum; then in a decoction of oak-bark; then in a bath of lime-water; and next in a bath of nitro-muriate of tin. Another, but less permanent, nankeen dye is produced by boiling alumina in a strong solution of pearl ashes, and diluting with water to the required tint.

NANKING, capital of the province of Kiangsu, formerly the capital of China, on the Yangtze River, 90 miles from the beginning of its estuary, n. lat. 32° 40' 40", e. long. 118° 47'. Its name signifies the Southern Capital. Since the removal of the seat of government to Peking (Northern Capital), it has been called by the Chinese Kiangning-fu. The walls enclose an area of nearly 20 miles in circumference, the greater part of which, however, is entirely waste. They reach in many places an elevation of 70 feet, and are fully thirty feet in thickness at the

base. According to Chinese accounts, the population of N. was once 4,000,000, but a more recent estimate made it 309,000. As the city, however, has of late passed through so many vicissitudes. It is impossible to ascertain its present number of inhabitants. The inhabited portion of the walled area lies toward the west, and several miles from the bank of the river. It is no longer possible to speak of N. in the language which former travellers used. The barbaric desolations to which it was subjected during the Taeping rebellion left it a sort of wreck, and one can only describe it as it was, before the victorious assault of the rebels, on the 19th March 1852. N. is the seat of the vice-regal government for the provinces grouped together under the name of Kiangnan. Here, as elsewhere in China, there was, and again is, a Manchu garrison, or military colony, separated by a wall from that portion of the city which is occupied by the Chinese. Some of the finest streets of N. were in the Tartar city; several being nearly 40 feet wide, having a space in the middle of about 8 feet in width, flagged with well-hewn blocks of blue and white marble, and on each side of this a brick pavement 14 feet or more wide. A deep canal or ditch runs from the river directly under the walls on the west, serving to strengthen the defences of the city on that side. The ancient palaces have all disappeared. The offices of the public functionaries were numerous, but, like the shops, presented the general features common to all Chinese towns. The objects most worthy the inspection of the traveller are found, in ruins, outside the precincts of the modern city. Among these is the summer palace of the Emperor Kienlung. It consisted of a number of one-story buildings, with spacious courts between, and flanked by smaller buildings on the sides. Enough still remains to shew that the workmanship was of the most elaborate and unique character. When under cultivation, the spot must have been exceedingly beautiful. The tombs of the kings are remarkable for their sepulchral statues, which form an avenue leading up to the graves; they consist of gigantic figure, like warriors cased in a kind of armor, standing on either side of the road, across which, at intervals, large stone tablets are extended, supported by huge blocks of stone instead of pillars. Among the buildings totally destroyed by the rebels was the far-famed Porcelain Tower. It was erected by the emperor Yungloh, to reward the kindness of his mother; the work was commenced in the 10th year of his reign (1418), at noon, on the 16th day of the moon, in the sixth month of the year, and was completed in nineteen years. The board of works was ordered, according to the plan of the emperor, to build a tower nine stories high, the bricks and tiles to be glazed, and of "blue colors;" and it was to be superior to all others, in order to make widely known the virtues of his mother. Its height was to be 322 feet. The ball on its spire was to be of brass, overlaid with gold, so that it might last forever and never grow dim. From its eight hooks as many iron chains extended to the eight corners of its highest roof; and from each chain nine bells, suspended at equal distances apart; these, together with eight from the corners of each projecting roof, amounted to 144 bells. On the outer face of each story were 16 lanterns, 128 in all; which, with 12 in the inside, made 140. It required 64 cattles of oil to fill them. On the top of the highest roof were two brazen vessels, weighing together 1900 pounds, and a brazen bowl besides, weighing 600 pounds. Encircling the spire were nine iron rings, the largest being 68 feet in circumference, and the smallest 24 feet, altogether weighing nearly 5000 pounds. In the bowl on the top were deposited one white shining pearl, one fire-averting pearl, one wind-averting pearl, one water-averting pearl, one dust-averting pearl, a lump of gold weighing 50 ounces, a box of tea-leaves, 1000 taels of silver, one lump of ornament, altogether weighing 4000 pounds; one precious stone-gem, 1000 strings of copper coin, two pieces of yellow satin, and four copies of Buddhist classics. N. continued in possession of the Taeping rebels till the successes of the troops under Major Gordon had crushed one after another all their outlying forces, when at length, on the 19th of July 1864, the city was stormed by the imperialist soldiers under the viceroy Tseung Kwo-fan. The last blow was thus dealt to the Taeping rebellion, whose principal leader perished by his own hand amid the blazing ruins of the palace he had occupied for eleven years. Since its recapture, N. has resumed its former position as the seat of the vice-regal government, but shews few signs of revival from its desolation. It has, however, been made the headquarters of a large military force, and also of an arsenal for the manufacture of cannon and other warlike stores on the European model. Although specified in the Treaty of

Tientsin (1858) as a river-port to be opened, no steps have been taken to proclaim it one.—Dr Macgowan, "North China Herald," and "Treaty Ports of China and Japan" (1867).

NANTES, (anc. *Namnetes*, or *Nannetes*), an important seaport town of France, capital of the department of Loire-Inférieure, is situated on the right bank of the Loire, 30 miles from its mouth, and at the point of confluence with it of the Erdre and the Sèvre-Nantaise, both navigable streams. Besides railways, there is communication with the interior by steamers on the Loire. The natural beauties of the site have been much improved by art, and now, the noble river on which the town is placed, covered with craft of every size and description, the islands that stud its channel, the meadows that skirt its banks, and the bridges (upwards of 16 in number) that cross it and its tributaries here, combine to make the scene a highly picturesque one. N. contains numerous squares and churches. Several districts of the town are nearly as fine as the best districts of Paris, the old town having been pulled down between 1865 and 1870. This town possesses numerous striking and beautiful buildings; among which the cathedral of St Pierre, containing the splendid monument of Francis II., the last Duke of Bretagne, and of Marguerite, his wife; and the old castle, the temporary residence of most of the kings of France since Charles VIII., and built in 938, are the chief. There is a public library containing 50,000 vols.; a museum of paintings; and a museum of natural history. The quays, lined on one side with houses, and in some cases planted with trees, afford an agreeable and interesting promenade of about two miles in length. The most beautiful promenade, however, formed by the Cours St Pierre and the Cours St André, extends from the Erdre to the Loire. It is planted with four rows of trees, bordered with lines of palatial houses, and ornamented with statues. The harbor, 1968 yards in length, is capable of accommodating upwards of 500 vessels. Formerly, vessels of no more than 200 tons could reach the port, all vessels of greater burden unloading at Palmbœuf, at the mouth of the river; but within recent years, much has been done by dredging for the improvement of the river-bed, and large vessels can now reach the harbor. The chief manufactures of N. are varieties of linen and cotton fabrics, calicoes, flannels; musical, mathematical, and optical instruments; refined sugar and salt; chemical products, cordage, &c. It contains tanneries, copper foundries, brandy distilleries, &c., and numerous establishments engaged in the various manufactures to which a port gives rise, as ship-building, the preparation of preserved meats, &c. In 1872, the imports of N. were valued at 70,000,000 of francs, the exports at 66,000,000. Population in 1876, 116,093.

NANTES, Edict of, the name given to the famous decree published in that city by Henry IV. of France, 13th April 1598, which secured to the Protestant portion of his subjects freedom of religion. Among its more important provisions were—liberty to celebrate worship wherever Protestant communities already existed; to establish new churches, except in Paris and the surrounding district, and in the royal residences; and to maintain universities, or theological colleges, of which they had four, those at Montauban, Saumur, Montpellier, and Sedan; adherents of the Reformed faith were also to be eligible to all civil offices and dignities; but, on the other hand, they were not allowed to print books on the tenets of their religion, except in those places where it existed; and they were obliged to outwardly celebrate the festivals of the Catholic Church, and to pay tithes to the Catholic priesthood. From this period the Reformers or Huguenots (who then counted 760 churches) had a legal existence in France, but gradually their political strength was crushed by the mighty genius of Richelieu—who, however, never dreamed of interfering with their liberty of worship. Neither did his successors, Mazarin and Colbert; but under the influence of a "penitence," as corrupt and sensual as the sins which occasioned it, Louis XIV., after a series of detestable *Dragonnades* (q. v.), signed a decree for the revocation of the edict, 18th October, 1685.—The result of this despotic act was that, rather than conform to the established religion, 400,000 Protestants—among the most industrious, the most intelligent, and the most religious of the nation—quitted France, and took refuge in Great Britain, Holland, Prussia, Switzerland, and America. The loss to France was immense; the gain to other countries, no less. Composed largely of merchants, manufacturers, and skilled artisans, they carried with them their knowledge, taste, and aptitude for business.

Nantucket  
Naphtha

394

From them England, in particular, learned the art of manufacturing silk, crystal glasses, and the more delicate kinds of jewellery.

**NANTUCKET**, an island and town upon it, on the south-east coast of Massachusetts. The island is 15 miles long and an average of 4 wide, with an area of 80 square miles. It was bought from the Indians by Thomas Macy, in 1659, for £20 and two beaver-hats. N. was at one time a great seat of the whale fishery, having in 1775 had as many as 150 whaling vessels; but this branch of industry has declined since 1846, and since the civil war has become extinct. The harbor is commodious and safe. N. has 2 newspapers; pop. (1870) 4123.

**NA'NTWICH**, a small market-town of Cheshire, England, on the Weaver, 30 miles south-east of Chester. Many of its houses are interesting from their age and construction, being built in many cases of timber and plaster, and with overhanging upper stories. The parish church, one of the finest country churches in England, was thoroughly restored in 1864 at great cost. N. was famous in former times for its brine-springs and salt-works. Shoes, gloves, and cotton goods are manufactured, and mailing is carried on. Pop. (1871) 6673.

**NA'OS** (Gr. a dwelling), the cell or enclosed chamber of a Greek temple.

**NA'PHTHA** is derived from the Persian word *nafta*, to exude, and was originally applied to an inflammable liquid hydrocarbon (or rather a mixture of several hydrocarbons) which exudes from the soil in certain parts of Persia. (According to Pelletier and Walter, it consists of three hydrocarbons—viz.,  $C_{12}H_{18}$ , which boils at  $190^{\circ}$ ;  $C_{16}H_{22}$ , which boils at  $239^{\circ}$ ; and  $C_{20}H_{32}$ , which boils at  $314^{\circ}$ .) The term is, however, now used not only to designate a similar and almost identical fluid, that issues from the ground in many parts of the world, and is known as petroleum, rock-oil, &c., but is also applied to other liquids which resemble true naphtha in little else than in their volatility and inflammability. Thus, wood-spirit or methylic alcohol is often spoken of as *wood-naphtha*, and acetone is sometimes described as naphtha. Coal-tar yields by distillation a liquid which has a heavier specific gravity and a lower boiling-point than Persian naphtha, but resembles it in general properties, and can generally be substituted for it. See **GAS-TAR**.

Crude Naphtha, whether occurring as a natural product, or as obtained from coal-tar, is purified by agitation with strong sulphuric acid; after which it must be well washed with water (in which it is quite insoluble), and finally distilled from quicklime. Pure naphtha is colorless, and of a peculiar taste and odor; it is soluble in about eight times its bulk of alcohol, and dissolves in all proportions in ether and in the essential oils. Hot naphtha dissolves phosphorus and sulphur, but deposits them on cooling. It is an excellent solvent for gutta-percha, caoutchouc, camphor, and fatty and resinous bodies generally; and hence it is extensively used in the arts for these purposes, and its employment as a source of artificial light is now becoming universal. In consequence of its containing no oxygen, it is employed by chemists for the preservation of potassium and other metals, which have a powerful affinity for oxygen. Owing to its volatility and inflammability, it must be handled with great caution, many fatal cases having arisen from its vapor catching fire on the approach of a candle.

The principal kinds of naphtha known in commerce are native naphtha, coal naphtha, Boghead naphtha (also called paraffin oil and photogen), shale naphtha, and naphtha from caoutchouc or caoutchine.

Native naphtha, petroleum, or rock-oil, is found in many parts of the world, as in Japan, Birmah, Persia, the shores of the Caspian Sea, Siberia, Italy, France, and North America. It is of various degrees of consistency, from a thin, light, colorless fluid found in Persia, with a specific gravity of about 0.750, to a substance as thick as butter, and nearly as heavy as water. But all the kinds when rectified have nearly the same constitution. They contain no oxygen, and consist of carbon and hydrogen compounds only. Bitumen and asphaltum are closely allied substances in a solid or semi-solid form. From a very early period in Persia and Japan, and at least since last century in Italy, native naphtha has been used to burn in lamps.

Coal-tar naphtha (see **GAS-TAR**), as stated above, is of a higher specific gravity than native naphtha—viz., from 0.860 to 0.900, and has a more disagreeable and penetrating odor.

Paraffin oil, for some time known also as Boghead naphtha, has become, of late years, so important a manufacture, that a brief history of its origin cannot be uninteresting. In the year 1847, Mr James Young, now of the Bathgate Chemical Works, had his attention called to a petroleum spring at Alfreton, in Derbyshire, from which he distilled a light thin oil for burning in lamps, obtaining at the same time a thicker oil, which was used for lubricating machinery. After a year or two the supply began to fail, but Mr Young, noticing that petroleum was dropping from the sandstone roof of a coal-mine, conjectured that it originated by the action of heat on the coal-seam, the vapor from which had condensed in the sandstone, and supposed from this that it might be produced artificially. Following up this idea, he tried a great many experiments, and ultimately succeeded, by distilling coal at a low red-heat, in obtaining a substance resembling petroleum, which, when treated in the same way as the natural petroleum, yielded similar products. The obtaining of these oils and the solid substance paraffin from coal formed the subject of his now celebrated patent, dated October 17, 1850.

In the years 1860 and 1864, long and costly litigations as to the validity of Mr Young's patent took place in Edinburgh and London, resulting in the main in his favor. Many years ago, Reichenbach had, by distilling 100 lbs. of pit-coal, obtained nearly two ounces of an oily liquid exactly resembling natural naphtha; and various other chemical writers were appealed to, as proving that methods substantially the same as Mr Young's were previously known and practised. One thing seems to have been admitted, that previous to his patent, no one had succeeded in producing the oil on a commercial scale.

The processes by which the oil and paraffin are obtained are simple. The material best adapted for the purpose was for years believed to be Bog-head coal, a very rich gas-coal, occurring in a field of limited extent near Bathgate in Linlithgowshire. All cannel coals, however, give the same products, and some of them in nearly as large quantity; but, as stated below, shale is now generally used and treated in the same way. The coal is broken into fragments like road-metal, and gradually heated to redness in cast-iron retorts, which are similar to those used for coal-gas (see Gas). The retorts are most usually upright, about 10 feet long and 14 inches in diameter at the bottom, tapering to 12 inches at the top, and built in sets of 3, 4, or 6, so that one fire may heat each set. The coal is fed by means of a hopper on the top of the retort, and after passing through it at a low red-heat, is drawn out as coke at the bottom, where there is a water lute to prevent the escape of oil or gas. There is a spherical valve in the hopper, counterpoised with a weight, which closes the retort at the top. The volatile matters distilled from the coal are conducted by a pipe to the condensers (similar to those used for coal-gas), where they are condensed into a thick black oil, of a specific gravity of about 0.900, along with a little water. Great care is necessary to prevent the heat from becoming too high, because gas and gas-tar, and not paraffin oil, are obtained when coal or shale is distilled at a high temperature. A ton of Boghead coal gave about 120 gallons of crude oil.

The crude oil from the first distillation is then distilled again in long cylindrical malleable-iron stills. From this second distillation a "green oil" is obtained, and the residue is removed as coke from the bottom of the still. This oil is then mixed with from 5 to 10 per cent. of sulphuric acid, and afterwards with about the same quantity of soda, the mixture being made in circular tanks with revolving stirrers. Both the acid and the soda mix with impurities, which fall to the bottom as heavy tarry matters, and are run off by a stop-cock, till only the clear supernatant oil remains. After being so far purified, the oil undergoes three further distillations, being at the same time treated with strong acid (1 per cent.) and soda. The final result is, that a small quantity of light naphtha is obtained in the later distillations, three-fourths of what is left being a light and nearly colorless oil used for burning in lamps, and the remainder a thicker oil containing paraffin. This latter portion is pressed in a hydraulic press, which squeezes out the greater portion of the paraffin, leaving an oil which is sold for lubricating machinery.

The crude paraffin, after being subjected to hydraulic pressure three or four times is chiefly purified, by repeated crystallisations, from naphtha. Steam is afterwards blown through it in a melted state, and when finally treated with 8 per cent. of animal charcoal, it is an exquisitely beautiful substance, resembling the purest white wax. It is largely manufactured into candles, which equal, or even excel, in

**Naphthalic**  
**Napier**

396

appearance those made from wax, and are only about half as costly. Paraffin has now a number of curious minor applications.

Shale naphtha, or "shale-oil," is a substance which has been manufactured, for many years, from bituminous shales both in England and on the continent. Partly because the Boghead coal has become practically exhausted, but chiefly because the volatile products from it are more easily purified than from any coal, beds of bituminous shale found in the carboniferous formation are now almost entirely used in Scotland as the raw material from which paraffin oil and paraffin are obtained. Previous to 1856, these shales were turned to no account. See SHALE.

Naphtha from caoutchouc, or caoutchine, is obtained from caoutchouc by destructive distillation. In composition it consists mainly of hydrocarbons, having the same proportion of carbon to hydrogen as india-rubber. Caoutchine has the reputation of being one of the best known solvents for india-rubber.

Until the discovery of the Pennsylvanian, the Burmese (Rangoon) petroleum or rock-oil was one of the best known. It is obtained in a treacherous state, by sinking wells about sixty feet in the soil, and consists of several fluid hydrocarbons, with about ten or eleven per cent. of the solid hydrocarbon paraffin. The different naphthas it contains are highly prized as burning and lubricating oils, and for removing greasy stains, on account of their agreeable smell. The naphtha which is found abundantly at Baku, on the shores of the Caspian Sea, closely resembles the Rangoon in its qualities. The Persian naphtha is frequently pure enough for burning without rectification.

Prominent among the wonders of our time, however, as regards new fields of industry and wealth, stand the discoveries of the naphtha, or, as they are called, the petroleum regions of the United States. Some of these sources of native naphtha were known to the Indians, by whom it was at one time collected for sale; but it is little more than twenty years since, by sinking deep wells, the great extent of the oil-bearing strata became known. The principal supplies are obtained in Pennsylvania, West Virginia, and Ohio, a considerable quantity being also obtained in West Canada. Other regions in North America produce it, but the Pennsylvanian yield is six or seven times greater than all the rest put together. Consul Korrigh, in his report on the states of Pennsylvania, Ohio, &c., for 1870 and 1871, says: "The oil regions are 100 miles in length by 30 to 50 in breadth, and the number of wells to be tapped so great, that the supply is considered to be sufficient for a century to come at least."

Much curiosity exists respecting the origin of these great natural sources of petroleum. It seems to be the general opinion of geologists that it has in most cases been produced by the decomposition of both vegetable and animal matters. In this respect it differs from coal, which has arisen from the decay of vegetable matter alone. It would appear that the Pennsylvanian oil proceeds from shales of carboniferous age; the Canadian, from those of Devonian age. In both countries the oil is found in cavities in sandstone, and has therefore been derived from subjacent rocks. It is now known that petroleum has formed in rocks of nearly all geological ages. Professor Dana, the American mineralogist, says that the conditions favorable to the formation of native naphtha, as shewn by the characteristics of the deposits in which it is found, are: (1) the diffusion of organic material through a fine mud or clay; (2) the material in a very finely divided state; and (3), as a consequence of the preceding, the atmosphere excluded as far as possible from the material undergoing decomposition.

In Pennsylvania the first borings for petroleum took place in 1859, and in that year 89,000 barrels (reckoned at 43 gallons each) were obtained; in 1861, the produce had reached 2 million barrels; and since then, as a rule, it has increased from year to year. In 1872, the total produce of North America was 7,394,000 barrels; Canada furnishing 530,000 barrels. In the same year the total exports from the United States of refined petroleum amounted to 2,951,310 barrels, an enormous quantity, considering the first exports took place so recently as 1861. Of late years, the petroleum trade is said to have employed in North America as many hands as coal-mining and the working of iron.

In 1862 and 1871, acts of parliament were passed limiting the amount of petroleum to be kept in store, and regulating the sale of such kinds as give off an inflam-

mable vapor below 100° F. There are special warehouses for the reception of petroleum at the London and Liverpool docks.

Terrible accidents have now and then happened with some of the more inflammable American oils, by reason of their vapors exploding in the reservoirs of lamps. Most of these have, no doubt, taken place with oils whose vapors form an explosive mixture with air at a temperature below 100° F., but they can hardly be considered safe if their vapors will take fire on the approach of a light at less than 120° F. The vapor of the paraffin oil prepared for illuminating purposes by Young's Mineral Oil Company, and no doubt by other firms, from Scotch shale, will not form an explosive mixture below 120° F., and it is therefore quite safe. Since this oil has to compete with petroleum, such a standard can only be kept up at a loss, and there is therefore a great temptation to keep down the firing-point of these burning oils as low as possible, with a view to greater profit; and although accidents have happened with paraffin oil, as well as with American petroleum, there is little doubt that the latter cannot be so thoroughly relied upon for safety. It could easily be made so, however, if the lighter hydro-carbons which it contains were carefully removed.

**NAPHTHALIC GROUP OR SERIES.** The starting-point of the group is *Naphthalin* ( $C_{10}H_8$ ), a substance of great interest in the history of organic chemistry, from its being that upon which Laurent chiefly founded his Theory of Substitutions. It may be obtained in various ways, but is most easily and abundantly produced from the last portions of the distillate of coal-tar, which become semi-solid on cooling. The liquid part of this mass is got rid of by pressure, and the naphthalin is then taken up by hot alcohol, from which it is obtained in a pure state by crystallization and sublimation.

Naphthalin crystallises in large, thin, rhombic plates, which are unctuous to the touch, and have a pearly lustre. Exposed to light under a glass covering, it gradually sublimes at an ordinary temperature in splendid crystals. It has a somewhat tar-like odor, and a pungent and somewhat aromatic taste. It fuses at 174°, and boils at 428°. Its specific gravity, in the solid state, is 1.15, and as a vapor, 4.92. It is not very inflammable, and when ignited, burns with a white smoky flame. It is insoluble in water, but dissolves readily in alcohol, ether, and the fixed and essential oils.

By acting on naphthalin with an excess of sulphuric acid, we obtain *sulpho-naphthalic acid* ( $C_{10}H_6S_2O_6 + 2Aq$ ), from which, by substitution processes, a large number of compounds are produced. With nitric acid, naphthalin yields nitro-naphthalin [ $C_{10}H_7(NO_2)$ ], dinitro-naphthalin [ $C_{10}H_6(NO_2)_2$ ], and trinitro-naphthalin [ $C_{10}H_5(NO_2)_3$ ], the group ( $NO_2$ ), or its multiples, being substituted for one, two, and three equivalents of the hydrogen of the naphthalin. The final product of the prolonged action of boiling nitric acid on naphthalin is a mixture of oxalic and *naphthalic* or *phthalic acid*; the re-action being shewn by the equation:

Naphthalin. Oxygen. Oxalic Acid. Naphthalic Acid.

This acid is also obtained by the continued action of nitric acid upon alizarin, which is an important fact, since it indicates a connection between naphthalin and the coloring matter of madder.

Laurent has discovered a very numerous series of substitution compounds formed upon the type of naphthalin, into the composition of which chlorine enters. They are of little practical importance although their investigation has exerted a remarkable influence upon the progress of organic chemistry.

**NAPIER, John, Laird of Merchiston,** was born at Merchiston Castle, near Edinburgh, in 1550, and died there on the 4th of April 1617. After attending the regular course in Arts at the university of St Andrews, he travelled for some time on the continent, and returned to his native country highly informed and cultivated for the age. Declining all civil employments, for which his many accomplishments eminently fitted him, he preferred the seclusion of a life devoted to literary and scientific study. From this time his history is a blank till 1593, when he published his "Plaine Discovery (or 'Interpretation') of the whole Revelation of St John" (Edin. 5th ed. 4to, 1645), a work displaying great acuteness and ingenuity, but, it is scarcely neces-

sary to add, not in any sense a "plaine discovery" of the apocalypse. In the dedication to King James VI., he gave his majesty some very plain advice regarding the propriety of reforming his "house, family, and court;" and on republishing the work, he added a supplement, resolving "certaine doubts mooved by some well-affected brethren." About this time he seems to have devoted much of his time to the invention of warlike machines, but these inventions were never perfected, probably from motives of humanity. Like other eminent men of the time, N., though a strict Presbyterian, seems to have been a believer in astrology and divination, but there is no satisfactory proof that he ever practiced these arts. In 1596, he proposed the use of salt as a fertiliser of land, an idea which, though scouted at the time, is now generally received. Another large blank in his history here occurs, and terminates in 1614, at which date he first gave to the world his famous invention of Logarithms (q. v.), in a treatise entitled "*Mirifici Logarithmorum Canonis Descriptio*" (4to, Edin.). This was followed by another work, "*Rab-dologice, seu numerationis per Virgulas libri dus*" (Edin. 1617), detailing an invention for simplifying and shortening the processes of multiplication and division. See **NAPIER'S BONES**. He also prepared a second work on Logarithms, shewing their mode of construction and application, with an appendix containing several propositions of spherical trigonometry, and those formulæ which are now known by his name. This work was published after his death by his son Robert, under the title of "*Mirifici Logarithmorum Canonis Constructio, &c., quibus accessere Propositiones ad Triangula spherica facilloro calculo resolvenda, &c.*" (Edin. 1619), and occurs along with the "*Canonis Descriptio*." The latter work is included in Baron Masere's extensive collection, the "*Scriptores Logarithmici*" (Lond. 1808). N.'s eldest son, Archibald, was raised to the peerage as the first Lord Napier by Charles I. in 1627, and his descendants still bear the title. Two lives of N. have been published, the one by the Earl of Buchan (1781), and the other by Mr Mark Napier (1834).

**NAPIER**, Sir Charles James, G.C.B., English general, one of several brothers distinguished for their bravery, three of whom—Charles, William, and George—were known in the Peninsular War as "Wellington's Colonels." They were sons, by a second marriage, of Hon. Colonel George Napier, grandson of Francis, fifth Lord Napier, who was fifth in descent, but through two females in succession, from the inventor of Logarithms. Charles, the eldest was born at Whitehall, Westminster, August 10, 1752. Before he had finished his twelfth year, young N. received a commission in the 22d Foot. His first service was in Ireland, where he assisted in putting down the rebellion. He commanded the 50th Foot during the retreat on Corunna; and at the fatal battle in which Sir J. Moore fell, he was wounded in five places and made prisoner. Marshal Ney dismissed him, with permission to go to England on parole. On his return, he engaged in literary works, and even wrote an historical romance. In 1811, he returned to the Peninsula. At Coa, where he fought as a volunteer, he had two horses shot under him. At Busaco, he was shot in the face, having his jaw broken and his eye injured. He recovered in time to be present at the battle of Fuentes d'Onoro and the second siege of Badajoz. After distinguishing himself in innumerable skirmishes, the daring soldier returned to England. He next took part in a fighting cruise off the Chesapeake, capturing American vessels, and making frequent descents upon the coasts. He did not return to Europe soon enough for Waterloo, but was engaged in the storming of Cambrai, and accompanied the army to Paris. After the peace he was, in 1818, made governor of the island of Cephalonia, the affairs of which he administered with great energy and intelligence. Being, however, of an excessively combative disposition, he became embroiled with the authorities at home. In 1841, he was ordered to India to assume the command of the army at Bombay. This was the most splendid period of his career, resulting in the conquest of Scinde against terrible odds. His destruction of a fortification called Emaan Ghar in 1843, was described by the Duke of Wellington as one of the most remarkable military feats he had ever heard of. The fearful battle of Meanee followed, where N., with 1600 English and sepoys, defeated near 30,000 Beloochees, strongly posted, with the loss of 6000 men. The Ameers surrendered, except Shere Mahomed, who brought 25,000 men into line of battle at Hyderabad. N. had only 5000 men, but in three hours his little army gained a decisive victory. A few days afterwards, N. was in the palace of the Ameers, and

master of Scinde. He was fortunate in possessing the entire confidence of Lord Ellenborough, who made him governor of Scinde. His civil administration was scarcely less remarkable or less successful than his military operations. He gained the respect and reverence of the inhabitants, but soon became engaged in an acrimonious war of despatches with the directors. In 1847, he returned to England. After attending a series of festivals in his honor, he lived in retirement until the disasters of the last Sikh war caused the eyes of his countrymen to be turned to the hero of Scinde as the deliverer of our Indian empire. He went to India, but found on his arrival that the Sikhs had been routed. He now turned his attention, as commander-in-chief of the army in India, to the subject of military reform. He bade a final adieu to the East in 1851, and returned to his native country, where he resided until his death, which took place at his seat, at Oaklands, near Portsmouth, August 29, 1853. He had then attained the rank of lieutenant-general, was G.C.B., and colonel of the 22d Foot. It must be remembered to his honor that he was the first English general who ever recorded in his despatches the names of private soldiers who had distinguished themselves, side by side with those of officers. Brave to rashness, ready alike with tongue, pen, and sword, quarrelsome with his superiors, but beloved by his soldiers, and, to crown all, of a strangely wild yet noble and striking appearance, N. was one of the most remarkable men of his time, and in losing him the country lost one of its brightest military ornaments. His statue was, after his death, erected in Trafalgar Square. The story of his "Conquest of Scinde" has been written by his brother, Lieutenant-General SIR WILLIAM FRANCIS PATRICK NAPIER, K.C.B., born 17th December 1785, who served in the Peninsular campaign, and was engaged from 1824 to 1840 in preparing his "History of the Peninsular War," the greatest military history in the English language. He died February 12, 1860, at Scinde House, Clapham, and was followed in a few weeks to the tomb by his wife, Lady Napier, niece of the great C. J. Fox. Her extraordinary skill in translating French documents written in cypher, and her indefatigable labors as her husband's amanuensis, are touchingly commemorated in the preface to the edition of the "History of the Peninsular War," published in 1851.

NAPIER, Sir Charles, K. C. B., English admiral, was cousin to the hero of Scinde and the historian of the Peninsular War. His father was the Hon. Captain Charles Napier, R. N., second son of Francis, fifth Lord Napier. He was born March 6, 1784, at the family seat, Merchiston Hall, in the county of Stirling. At 18, he went to sea as a naval volunteer. In 1808, he received the command of the *Recruit*, 18 guns, and had his thigh broken by a bullet. He kept up a running fight, in his 18-gun brig, with the rearmost of three French line-of-battle ships, the *D'Hautpoult*, which escaped from Guadeloupe, and was thus instrumental in her capture. This obtained him a post-captaincy; but being thrown out of active service, he served ashore as a volunteer in the Peninsular army, and was wounded at Busaco. Commanding the *Thames* in 1811, he inflicted an incredible amount of damage upon the enemy in the Mediterranean, and also conducted several desperate land operations with marked success. In 1814, he was ordered to America, and led the way in the hazardous ascent and descent of the Potomac. He afterwards took an active part in the operations against Baltimore. In 1822, he received the command of the *Galatea*, a 42-gun frigate, and was employed on "particular service" on the coast of Portugal. Becoming acquainted with the leaders of the Constitutional party, he accepted the command of the fleet of the young queen; and by defeating the Miguelite fleet, he concluded the war, and placed Donna Maria on the throne. He was made admiral-in-chief of the Portuguese navy, and attempted to remodel it; but official and corrupt influence was too strong for him, and he returned to England. In the war between the Porte and Mehemet Ali, he organized a land force, with which he stormed Sidon, and defeated Ibrahim Pasha among the heights of Mount Lebanon. He took part in the naval attack on Acre, and did not hesitate to disregard the orders of his chief, Admiral Stopford, when he saw the way to bring the battle to a speedy termination. He next blockaded Alexandria, and concluded a convention with Mehemet Ali. In 1847, he received the command of the Channel fleet. When the Russian war broke out, he was sent out to command the Baltic fleet; but the capture of Bomarsund failed to realise the high expectations formed of N.'s exploits. He twice sat in parliament, and, until his death, November 6, 1860, he labored with

Napier  
Naples

400

success to reform our naval administration. He was at the time of his death a vice-admiral and a knight of several foreign orders.

**NAPIER**, The Right Hon. Sir Robert Cornelis, Baron Napier of Magdala, was born in Ceylon, 6th December 1810, and was educated at the Military College at Addiscombe. He entered the Bengal Engineers in 1830, served in the Sutlej campaign, was wounded while acting as chief engineer at the siege of Moultan, and had a prominent share in the battle of Gujerat. As chief engineer of the Punjab, with the rank of colonel, he greatly developed the resources of the country. During the Indian mutiny, he was chief engineer in Sir Colin Campbell's army, and especially distinguished himself at the siege of Lucknow. For his services in the Chinese war of 1858, he was made major-general and K.C.B. As commander of the expedition in Abyssinia in 1868 he achieved a brilliant success, both by his whole management of the short campaign and in the storming of Magdala, which ended it. On his return he received the thanks of parliament, an annuity of £3000 and a peerage. In 1870, he was appointed Commander-in-chief of the forces in India, and nominated a member of the Indian Council. In 1877 he was made governor of Gibraltar.

**NAPIER'S BONES**, an invention of the celebrated Napier (q. v.) of Merchiston, for the purpose of performing mechanically the operations of multiplication and division. The "bones" were narrow slips of bone, wood, ivory, or metal, about 3 inches long by 3-10ths of an inch in breadth, and divided by transverse lines into nine compartments; each of these compartments being divided into two portions by a diagonal line running from the upper right hand to the lower left hand corners. The "bones" were divided into sets, all those of one set having the same digit occupying the top compartment, and the several multiples of that digit occupying in order the eight lower compartments; when the multiple consisted of two figures, these were placed one on each side of the diagonal line. There was necessarily a set of bones for each digit. There was also another rod similarly divided into compartments, in which were placed the nine digits; this was called the *index-rod*. Multiplication was performed as follows; e. g., if 6795 is to be multiplied by 97324, four rods whose top digits were 6, 7, 9, 5 are selected and arranged in the order of the figures in the multiplicand, and the index-rod placed alongside them, as in the figure; the several figures of the multiplier are then sought for on the index-rod, the two lines of figures opposite each figure on the index are then added together diagonally, and the five sums thus obtained are arranged as follows:

9	61155
7	47565
8	54360
3	20385
4	27180

664782030 = the product required.

Division is performed in an analogous manner. The contemporaneous invention of logarithms for the same purpose of converting multiplication and division into addition and subtraction, caused Napier's bones to be overlooked, and they are now scarcely ever used.

**NAPLES** (Ital. *Napoli*, anc. *Neapolis*), a city of Southern Italy, capital of the province of Naples, is built partly at the base, partly on the slopes of two crescent-shaped acclivities on the famous bay of the same name. Pop. (1872) 448,335. Lat. 40° 51' 8" N., long. 14° 15' 5" E. The wonderful beauty of the site and of the surrounding prospect, the delicious softness of the climate, and the clear atmosphere, make N. famed among the cities of the world. It is one of the chief centres of commerce and industry of Italy, possesses a very extensive mercantile shipping, and is one of the principal stations of Mediterranean steam-navigation.

The public buildings of Naples are numerous and grand, but are devoid of architectural symmetry in consequence of the antiquity of their origin and the irregularity of their site. Many of the old streets are paved with lava, and inconveniently narrow, with houses of great height. The modern streets, however, are spacious and splendid. The city is divided into the Old and the New Town, or the East and

West Crescent, by a lesser range of heights—viz., the Capodemonte, the St Elmo, and the Pizzofalcone, terminating in the rocky promontory called the Castel dell' Ovo. In 1688, a landslide destroyed a number of houses at the foot of Pizzofalcone. The eastern division of N. is the most ancient and the most densely peopled; it contains the principal public structures, and is intersected by the splendid Via or Street di Toledo. The western, or modern section, contains the famous Riviera di Chiaia, or the Quay, a fine road running along the bay in a curved course of three miles, flanked on the right by a row of palaces, and bordered on the left by the beautiful pleasure-grounds of the Villa Reale, which lie between it and the sea, and of which the natural beauty is heightened by the interspersions of temples, fountains, and statuary groups amidst the acacia, myrtle, and orange groves. The public squares, or *larghi*, of N. are adorned with fountains and obelisks; and within the precincts of the city, there are several highly-prized springs both of fresh and mineral waters. The fortified castles are numerous. Amongst the principal are the Castel Nuovo, called the Bastile of Naples, somewhat similar to the Tower of London, and adorned with a fine triumphal arch, erected in honor of Alfonso of Aragon; the Castel dell' Ovo, so called from its oval or egg shape, standing on a promontory, and connected by a bridge with the mainland; the Castel Sant' Elmo, commanding a magnificent view from its ramparts, and formerly of immense strength; and the dismantled Castle del Carmine. The churches are upwards of 800, and many are rich in architectural and archeological interest. The cathedral dedicated to St Gennaro (Januarius; q. v.) contains the celebrated phials in which the liquefaction of St Gennaro's blood is alleged to take place on two annual festivals; it also contains the tombs of Charles of Anjou and of Pope Innocent IV., besides numerous fine paintings and statues. The educational institutions of N. embrace famous schools of surgery, law, and general science. A magnificent aquarium has been opened since 1871, with a zoological laboratory in which many distinguished foreign naturalists are at work. The philanthropical establishments are on an immense scale, and are richly endowed. There are also several theatres in the city, of which that of *San Carlo* (devoted to the Opera) is one of the largest and most celebrated in Italy; but the characteristic theatre of N. is the *Teatro di San Carlino*, the headquarters of *Pulcinella* ("the Italian Punch." There are four grand public libraries; and in the Museo Borbonico, N. contains an unrivalled collection of art, comprising frescoes, paintings, mosaics, sculptures, bronzes, antiquities, coins, medals, inscriptions, and the renowned collection of precious objects excavated from Herculaneum and Pompeii.

The environs of N., apart from their extreme beauty of scenery, are highly interesting. The locality which contains the tomb of Virgil, the disinterred towns of Herculaneum and Pompeii, Vesuvius (from an eruption of which N. suffered in 1872), and the Roman remains, must possess an inexhaustible source of interest for scientific, antiquarian, and classical investigators. The modern villas of N. are splendid and luxurious. One of the most striking features of N. is its unique population and the universal publicity in which life is passed. The inhabitants forever swarm in the thoroughfares, where an incessant throng of vendors, purchasers, and idlers intermingle with asses, mules, hand-carts, and conveyances, dazzling the eye with their brilliant variety of costume, and the pantomimic expressiveness of their frantic gestures and attitudes; while the ear is stunned by the shrill conflicting cries of the ambulatory vendors of every conceivable commodity, by the piercing notes of the improvisatore's song, and the uproarious hilarity and high-pitched shouts of the countless masses, whose sole abode appears to strangers to be the thronged public squares and streets. The popular language of N., which is a corrupt dialect of Italian and Spanish, is in prevalent use among all classes of society; it lends itself especially to the satirical and facetious equibs and compositions in which the Neapolitans excel. The popular Neapolitan songs in the native patois are exquisitely naïve and expressive in sentiment, and are set to popular melodies which exert a maddening charm over this southern populace. The physical condition of the lower classes of N., and especially of the *lazzaroni* (q. v.), has of late years sensibly improved both as regards raiment and lodging.

The name Naples (Gr. *Neapolis*, new city) had reference to an older town in the neighborhood, called originally Parthenope, and, after the foundation of the new town, *Palaepolis* (old town), which was situated most probably on the ridge called *Pasillipo*, that separates the Bay of Pozzuoli or Baïæ from that of Naples. Both

Naples

towns were Greek settlements, apparently colonies from the neighboring Cumæ, joined by immigrants direct from Greece. In 337 B.C., Paleopolis was besieged and taken by the Romans, and thenceforth disappears from history; Neapolis submitted without resistance, and became a favored and faithful ally, or rather provincial city of Rome. It long, however, retained its purely Greek character and institutions; and there is evidence that the Greek language continued to be used, even in public documents, as late as the 2d c. of the Christian era. N. was a flourishing and populous city during the Roman empire; and notwithstanding the vicissitudes of the Gothic conquest of Italy, and the reconquests by the Byzantine emperors, it continued to be one of the most important and opulent places in Italy. About the 8th c., it threw off allegiance to the Byzantine emperors, remained independent till it fell into the hands of the Normans in 1140 A.D., and became the capital of the kingdom of Naples.

**NAPLES**, Bay of, an indentation of the Mediterranean Sea on the south-west coast of Italy, opposite the city of Naples, is 20 miles wide from Cape Miseno on the north-west to Cape Campanella on the south-east, and from this line extends inland for about ten miles. The scenery is very beautiful. On the shores are many towns and villages; the prospect is bounded on the east by Mount Vesuvius, and on the outskirts of the bay are the islands of Iachia and Capri.

**NAPLES**. The Italian provinces (formerly kingdom) of N. and Sicily, or the Two Sicilies, occupy the south end of the Italian peninsula, and consist of the continental territory of N. and the insular dependency of Sicily. The distinctive physical features of N. and Sicily are noted under the names of the different provinces of Italy and in the article SICILY. They are favored by nature with a salubrious and almost tropical climate, unbounded fertility, and teeming population; and they present natural features of rare attractiveness. The rural population are an acute, frugal, and laborious race, and form a strong contrast to their idle and debased brethren of the towns. For statistics of products, exports, and population, see ITALY and SICILY. N., in ancient times, was divided into numerous petty states independent of each other, and its inhabitants were of various races. Many of these states arose from Greek colonies, which had been founded in the country previous to the 5th c. B.C. The ancient historical importance of N. is attested by the splendor of its cities, and the warlike renown of its population. On its conquest by the Romans, the great Neapolitan cities severally adopted the municipal, federative, or colonial form of government, and gradually assimilated their laws and customs to those of their conquerors. After the downfall of the Western Empire, N. was seized by Odoacer, but soon afterwards, (490 A.D.) it was subjected by the Goths, and in the following century by the Lombards, who established in it various independent duchies, as Benevento, Spoleto, Salerno, Capua, &c. Most of these were overthrown by invading bands of Arabs, Saracens, and Byzantines, who were in turn expelled, and the whole country subdued by the Normans in the 11th century. The Normans subsequently erected N. and Sicily into a kingdom, and established a new political, ecclesiastical, and military system. To the Norman dynasty succeeded that of the Hohenstaufen, whose rule was marked by an immense intellectual and social advancement of the people; but the vindictive enmity with which the papal see regarded this dynasty, led to the invasion of N. by Charles of Anjou, who, notwithstanding the heroic resistance of King Manfred (q. v.), by the battle of Benevento (1266) annihilated the power of the Hohenstaufen. The ascendancy of Charles of Anjou was further effectually secured by the treacherous defeat and decapitation (1268) of Konradin (q. v.), the last male heir to the throne. By the *Sicilian Vespers* (q. v.) the island of Sicily was, however, wrested in 1283 from his grasp, and became an appanage of the Spanish crown. The predominance of the Neapolitan Guelph or papal party during the glorious reign of Robert I., who was the patron of Dante and Boccaccio, the depraved libertinism of his heirs and granddaughter Joanna, the fearful ravages committed by predatory bands of German mercenaries and by the plague, the futile attempts of the Anjou sovereigns to recover Sicily, and the envenomed feuds of rival claimants to the throne, are the leading features of the history of N. during the rule of this dynasty, which expired with the profligate Joanna II. in 1435; and was followed by that of Aragon, which had ruled Sicily from the time of the Sicilian Vespers. During the tenure of the

Aragon race, various unsuccessful attempts were made by the House of Anjou to recover their lost sovereignty; and the country, especially near the coast, was repeatedly ravaged by the Turks (1480). In fact, after the death of Alfonso, the first ruler of the Aragon dynasty, the country groaned under a load of misery. Wars, defensive and offensive, were incessant, the country was impoverished, and a conspiracy of the nobles to remedy the condition of affairs was productive of the most lamentable results, both to the conspirators themselves, and to the other influential Neapolitan families. In 1495, Charles VIII. invaded N., and though he was compelled to withdraw in the same year, his successor, Louis XII., with the treacherous assistance of Ferdinand (the Catholic) of Spain, succeeded in conquering the country in 1501. Two years afterwards, the Spaniards under Gonsalvo di Cordova (q. v.) drove out the French, and the country from this time became a province of Spain. Sicily had previously (1479) been annexed to the same kingdom. During the two centuries of Spanish rule in N., the parliaments which had existed from the time of the Normans fell into desuetude, the exercise of supreme authority devolved on viceroys, and to their ignorance, rapacity, and oppressive administration may be solely ascribed the unexampled misery and abasement of this period. In the words of Sismondi, "no tax was imposed save with the apparent object of crushing commerce or destroying agriculture, and the viceregal palace and the tribunals of justice became public offices in which the highest dignities and most sacred interests of the state were openly bartered to the wealthiest bidder." During the Spanish rule, a formidable rebellion took place in 1647, headed first by Masaniello (q. v.), and afterwards by Henry V., Duke of Guise; the whole population of the province renounced their allegiance to their Spanish sovereigns, but the arrival of a new viceroy, who was equal to the occasion, resulted in the capture of the Duke of Guise and the re-subjugation of the country. At length, during the war of the *Spanish Succession* (q. v.), N. was wrested from Spain by Austria in 1707, and Sicily in the following year; but while N. was secured to Austria by the treaties of Utrecht (1713) and Rastadt (1714), Sicily was handed over to Savoy by the former treaty. In 1720, however, both Sicilies were reunited under the Austrian rule, and in 1735 were given to Don Carlos, third son of Philip V. of Spain, who ascended the throne as Charles I., and founded the Bourbon dynasty. His reign was marked by equity and moderation; great reforms were effected in the administration of public affairs, science and literature were encouraged, and splendid works of public utility were erected throughout the kingdom. It was during his reign that Pompeii and Herculaneum were discovered. His successor, Ferdinand IV., followed in the course of legislative reform; but on the proclamation of the French Republic (1789), his states were invaded by a French army, and the kingdom of N. was erected into the Parthenopean Republic (1799). Ferdinand retired with his court to Sicily, and for a brief period enjoyed the restoration of his sovereign rights in N.; but a second invasion by Napoleon (1806) ended in a proclamation of his brother, Joseph Bonaparte, as king of N.; and on this latter assuming the Spanish crown in 1808, that of N. was awarded to Joachim Murat, brother-in-law of Napoleon. On the defeat and execution of Murat in 1815, the Bourbon monarch, Ferdinand IV., was restored. The liberal insurrectionary movements in N. in 1821 and 1830 were the forerunners of the revolution of 1848; and in each case the party of progress was combated by the respective kings with ruthless severity, and perfidious concessions, to be cancelled and avenged with sanguinary fury when the disarmed and credulous patriots were at the mercy of the sovereigns. See article GARIBALDI for the ultimate overthrow of the Bourbon dynasty in the kingdom of N., and its subsequent annexation to the kingdom of Italy under King Victor Emmanuel; also articles FERDINAND II. and ITALY. For the history of Sicily previous to its annexation to and during its various separations from N., see SICILY.

**NAPLES-YELLOW** is a pigment used by artists. It consists of antimoniate of lead, and is obtained by the direct combination of antimonic acid and oxide of lead under the influence of heat.

**NAPOLÉON BONAPARTE**, Emperor of the French, was born at Ajaccio, in the island of Corsica, 15th August 1769. (For an account of the family to which he belonged, see **BONAPARTE, FAMILY OF**.) At the age of 10 he entered the Military

School at Brienne, as a king's pensioner. Here he remained five years and a half. During that period he displayed a great aptitude and predilection for mathematics, history, and geography, and an indifference to merely verbal and literary studies. His manner was sombre and taciturn, but as Bourrienne (who was his schoolfellow) says, this arose chiefly from the circumstance that he was a foreigner, poor and unaccustomed to the use of French, which he first learned at Brienne. In October 1784, he proceeded to the Military School to complete his studies for the army, and in rather less than a year obtained his commission as sub-lieutenant in the artillery regiment *de la Perte*. When the Revolution broke out, N. was in garrison at Valence. He took the popular side, but in a quiet and unobtrusive way, for he did not love the boisterous enthusiasm of unmanageable mobs. When the armed rabble of Paris poured out to the Tuilleries on the famous 20th of June 1792, N., who was then in the city, followed the "despicable wretches" (as he called them), along with his friend Bourrienne; he saw them force the poor king to stick the red cap on his head, and smile fatuously from the windows of his palace. "It is all over henceforth with that man," said the young officer, and returned to Paris. He was more thoughtful than Bourrienne had ever seen him. After the scenes of the 10th August, he left for Corsica, where General Paoli held the chief command. The excesses of the Septembrists and Terrorists, however, induced Paoli to throw off his allegiance to the Convention, and to seek the assistance of England. N. was active but unsuccessful in his opposition to the designs of the general, and was obliged, along with his relatives, to flee from the island.

He now petitioned the Convention for employment, and was sent to assist in the reduction of Toulon, with the rank of lieutenant-colonel of artillery. The city was captured (19th December 1793) entirely through the strategic genius of N.; and in the following February he was raised to the rank of brigadier-general, and placed at the head of the artillery in the army of the south. Later in the year, he was sent to Genoa, to examine the state of the fortifications of the city, and to discover the political disposition of the inhabitants. In the beginning of 1795, he was again in Paris seeking active employment and thinking, from sheer ennui, of transferring his services to the Sultan of Turkey. The Convention was now in great peril, on account of the mutinous spirit of the *arrondissements* of the capital, and, on the suggestion of Barras, Carnot, Tallien, and others, N. was made commander of the troops provided for its defence. On the 18th Vendémiaire (4th October 1795), the national guard, 30,000 strong, attempted to force its way into the Tuilleries, where the Convention was sitting, but was routed and dispersed by a terrible cannonade directed by the young artillery officer. N. was immediately appointed to the command of the army of the interior. About this time, he made the acquaintance of Josephine Beauharnais, whom he frequently met at the house of Madame Tallien. Captivated by her elegant manners and amiable disposition, he proposed marriage to the graceful widow, and was accepted. The ceremony took place 9th March 1796. A few days before, he had been appointed to the supreme command of the army of Italy, and he was obliged to leave his bride almost at the altar. On his arrival, he found the troops in a wretched condition. He had only 36,000 available men, and even these were half-starved, and only half-clothed, to oppose to an Austrian and Piedmontese force of 75,000. Yet he was not afraid to undertake the conquest of Upper Italy. Leaving Nice at the close of March, he won his first victory over the Austrians at Montenotte (11th April), which opened the Apennines for him; three days later, a second success at Millesimo separated the allied armies; and, finally, his victory at Mondovi (on the 22d) compelled Sardinia to implore peace. He now hoped to utterly crush the Austrian army under Beaulieu, and at the battle of Lodi (on the 10th May) nearly accomplished it. His opponent did not venture to defend the line of the Mincio, but hastily throwing a garrison into the city of Mantua, retreated into the Tyrol. N. immediately entered Milan and took possession besides of all the principal cities of Lombardy. Now began that system of enormous and unscrupulous plunder in Northern and Central Italy which gives something of a barbaric character to the conquests of the French. The Directory gave orders that N. should levy contributions from all the states which he had gratuitously freed, and according to his own account, he sent to France not less than 50,000,000 francs. His officers and commissaries actually seized whatever they wished, provisions, horses, and all manner of stores; and because Pavia ventured to make some slight resist-

ance to the shameful extortions of the Republicans, N. gave it up to havoc for 24 hours! A body of savans (including Monge, Berthollet, and others) were despatched to Italy to superintend the spoliation of its artistic treasures; and both now and in the subsequent Italian campaigns, pictures, statues, vases, and MSS. were carried off in great numbers, to gratify the vanity of the Parisian sight-seers. In this way Lombardy, Parma, Modena, Bologna, and the States of the Church were savagely harried before the end of June—Pope Pius VI., in particular, being forced to submit to conditions of extreme rigor.

Meanwhile, Austria had resolved to make another effort for the recovery of Lombardy. About the close of July, Marshal Wurmser advanced from Trent at the head of 60,000 men, forced Napoleon to raise the siege of Mantua, but was himself defeated, with the loss of all his cannon, near Castiglione (5th August), and again at Bassano (8th September), in consequence of which, he was driven to take refuge within the fortress of Mantua with some 16,000 troops—the shattered remains of his 60,000. Austria, however, was not disheartened. A third army was dispatched in two divisions: 30,000 from Carinthia, under Marshal Alvinzi; and 20,000 from the Tyrol, under General Davidowich. This was a terrible campaign for N.; his veterans were exhausted, his new recruits had not arrived; he himself was dependant, while the Austrians were fresh and hopeful. At first, the latter were completely successful; but the great victory of Arcola, won by N. (17th November), after three days' fierce fighting, in which he lost nearly all his general officers, decided the fate of the campaign. His dispatches to the Directory, penned about this period, shew how thoroughly he apprehended the state of parties in Italy, and also how utterly indifferent he was to any considerations beyond those that advanced the interests of France. In January 1797, a fourth campaign was commenced by Austria. At the head of 50,000 fresh troops, Alvinzi descended from the Tyrol, but was completely routed by N. at Rivoli, on the 14th of the month; while not long after, Wurmser was starved into surrender at Mantua. A fifth army was assembled on the Tagliamento, under the command of the Archduke Charles: but his troops were mainly raw recruits, while those of N. were leagued to war, and flushed with innumerable triumphs. In consequence, he was forced to retreat, which, however, he did slowly and in good order, hoping to surround his opponent in the interior of the country. N.'s design was to march on Vienna, and he actually penetrated as far as Jndenburg, in Upper Styria, only eight days' march from the capital. The Austrian government at length was seized with alarm, made overtures of peace; and finally, on the 17th October 1797, the famous treaty of Campo-formio was signed, by which Austria ceded the Netherlands, Lombardy, and some other smaller territories to France; while she herself obtained in return, through disgraceful treachery on the part of the victor, possession of the province of Venice. It is generally said that N.'s military genius was never more brilliantly displayed than in these early Italian campaigns. In ingenuity of plan, celerity of movement, audacity of assault, he far outshines all his adversaries; it is, moreover, but just to him to state further, that he made desperate efforts to stop the excesses of the most scoundrelly commissariat in Europe; and that while in the main he shewed no hesitation in carrying out the brigand-like orders of the Directory, he does not appear to have appropriated a single penny to himself. It was power, not gold, that he cared for.

In December 1797, N. returned to Paris, where he was received with the utmost enthusiasm. At this time, there was much talk, and probably some vague design, on the part of the Directory, of invading England, and N. was appointed commander-in-chief of the invading army. It has been thought, however, that this was merely a feint to mask the real design of the Directory, viz., the invasion of Egypt, as perhaps a preliminary step to the conquest of British India. Be that as it may, an expedition against Egypt was resolved on by the Directory; and on the 19th of May, 1798, N. sailed from Toulon, with a fleet containing 30,000 soldiers, and a body of savans to investigate the antiquities of the country. He reached Alexandria on the 20th of June. At this moment, France was at peace with Turkey; the invasion of Egypt, a Turkish dependency, was therefore an act utterly unjustifiable, and reminds us not of European warfare, but rather of the irruption of a horde of barbaric Tartars. N. having lauded his troops, captured Alexandria, and marched on Cairo. The Mamelukes presented resistance; but on the 21st July, at the battle

of the Pyramids, they were completely defeated, and the French became, in a surface-way, masters of Egypt. N. now entered the capital, and immediately commenced to reorganise the civil and military administration of the country—for he took a great, but also an ostentatious pleasure in this sort of work. Meanwhile, on the 2d of August, Nelson had utterly destroyed the French fleet in Aboukir Bay, and so cut off N. from communication with Europe. A month later, the sultan declared war against him. This was followed by disturbances in Cairo, which were only suppressed by horrible massacres. It was obviously necessary that N. should go somewhere else. He resolved to meet the Turkish forces assembling in Syria; and in February 1799, crossed the desert at the head of 10,000 men, stormed Jaffa on the 7th March, after a heroic resistance on the part of the Turks; marched northwards by the coast, and reached Acre on the 17th. Here his career of victory was stopped. All his efforts to capture Acre were foiled through the desperate and obstinate valor of old Djezzar Pasha (q. v.), assisted by Sir Sidney Smith, with a small body of English sailors and marines. On the 21st of May, he commenced his retreat to Egypt, leaving the whole country on fire behind him, and re-entered Cairo on the 14th of June. It was during his absence that the savans made their valuable researches among the monuments of Upper Egypt. About the middle of July, the Sultan landed a force of 18,000 men at Aboukir, who were attacked by N. on the 25th, and routed with immense slaughter. But the position of the victor was far from comfortable, and he therefore resolved to return to France—especially as news had come to him of disasters in Italy and confusions in Paris. On the 23d of August, he sailed from Alexandria, leaving his army behind him, under the command of Kleber; and after narrowly escaping capture by the English fleet, landed near Frejus on the 9th October. He hastened to Paris, soon mastered the state of affairs, threw himself into the party of Sieyès, and overthrew the Directory (q. v.) on the famous 18th Brumaire. A new constitution was drawn up, chiefly by Sieyès, under which N. became First Consul, with the power of appointing to all public offices, of proposing all public measures in peace or war, and the entire command of all administrative affairs civil and military. In a word, he was ruler of France; and though far from satisfied with the clumsy machinery of Sieyès's plan, he could afford to wait the future. About the end of January 1800 he took up his residence in the Tuilleries. The country was tired of revolutions, discords, and confusions; it was proud of its young leader, who seemed inspired but not enslaved by the ideas of his age, and who knew how to enforce obedience, as well as to panegyrise principles. It therefore regarded his assumption of sovereign power with positive satisfaction. N. displayed extraordinary vigor as an administrator, recruited the national treasury, by various sagacious expedients, repealed the more violent laws passed during the Revolution, such as punishment for matters of opinion, reopened the churches, and terminated by policy the Vendean struggle. But he knew well that his genius was essentially military, and that his most dazzling and influential triumphs were those won on the battle-field. France was still at war with Austria, and he resolved to renew the glories of his first Italian campaign. Leaving Moreau in command of the army of the Rhine, he assembled, with wonderful rapidity and secrecy, an army of 86,000 men on the shores of the Lake of Geneva, and on the 13th May (1800), began his magnificent and daring march across the Alps. Almost before the Austrian general, Melas, was aware, N. had entered Milan (2d June). Twelve days afterwards, was fought the fiercely contested yet decisive battle of Marengo, which compelled the Austrians to resign Piedmont with all its fortresses, and (for the second time) Lombardy to the French. Later in the year, hostilities were recommenced; but the Austrians, beaten by Moreau in Germany (at Hohenlinden, &c.), and by N. in Italy, were at last forced to make peace; and on the 9th February 1801, signed the treaty of Lunéville, which was mainly based on that Campo-formio. In the course of the same year, France and England also made peace, but the treaty (known as that of Amiens) was not definitively signed till the 27th of March 1802. Not less important for the consolidation of affairs in France was the famous "Concordat" (q. v.) between N. and Pope Pius VII., also concluded in 1801. In January 1802, N. became President of the Cisalpine Republic; and on the 2d August following, was declared Consul for life by a decree of the French senate.

Meanwhile N. was busy superintending the drawing up of a code of civil laws for

France. He assembled the first lawyers in the nation, under the presidency of Cambacérès, and frequently took part in their deliberations; the results of their labors were the "Code Civil des Français," "Code de Procédure," "Code Penal," and "Code d'Instruction Criminelle," besides commercial and military codes, all of which often go loosely under the name of the "Code Napoléon." The first of these is an admirable production, and is in force to the present day. Considerable attention was besides paid to such branches of education as were likely to promote efficiency in the public service. Mathematics, physical science in all its departments, engineering, &c., were as vigorously encouraged as philosophy, ethics, and political speculation were discouraged. But the best proof that N. wanted not an educated people, but only active and expert tools and agents, was the indifference that he manifested to primary and elementary education. In a population of 32,000,000, the number of pupils under ten years is given by Fourcroy at only 75,000! The internal government was the acme of despotic centralisation. N. appointed all prefects of departments, and all mayors of cities, so that not a vestige of provincial or municipal freedom remained. He ruled France as he ruled the army of France, and was already an emperor in almost everything but the name.

Peace between France and England did not last long. N.'s policy in Italy irritated the British government, and as remonstrances were ineffectual, war was declared against France, 18th May 1803. The English fleet scoured the seas, paralysing the commerce of France; while N. threatened to invade England, and assembled a large army at Boulogne. So utterly did he misconceive the character and condition of Englishmen, that he felt sure (by his own statement) he should be welcomed as a liberator by the people! While these warlike preparations were going on, occurred the dangerous conspiracy of the Chouan chief, George Cadoudal (q. v.), Pichegru (q. v.), Moreau (q. v.), and others. Its discovery (February 1804) alarmed N. excessively, and led to what has been considered one of the blackest deeds in his career—the murder of the Duke d'Enghien (q. v.) on the 20th of March following. He now appears to have felt it necessary to assume the title of emperor. France, he alleged, wanted an empire as a symbol of permanent security. An appeal was made to the nation. Upwards of 8,000,000 votes were given in favor of the proposed change in the form of government; only 3000 or 4000 against it. But where there is no municipal freedom, one does not know what value to put on votes. On the 18th May, N. assumed the title of Emperor at St Cloud, and was crowned by, or rather in the presence of, the pope (for N. rudely crowned himself), on the 2d December. In the following summer (May 26) he was also crowned king of Italy, in the great cathedral of Milan; and Eugène Beauharnais, his step-son, was appointed to the office of Viceroy.

This policy of aggrandisement, which set at naught the conditions of the treaty of Lunéville, alarmed the other nations of Europe, especially Austria, who saw her Italian possessions seriously threatened. In 1805, a coalition was formed between England, Russia, Austria, and Sweden, mainly through the persevering policy of the first of these countries; and war again broke out in the month of September. N. acted with amazing celerity. Concentrating his widely-scattered forces at Mainz, he marched at once across Bavaria, compelled General Mack to capitulate at Ulm with 20,000 men (11th October); and on the 18th of November entered the capital of Austria. France was electrified; the rest of Europe was thunder-struck. But a more glorious triumph was yet to come. The Russian army was already in Moravia, under the immediate command of the Emperor Alexander I., and was there being joined by the scattered Austrian troops. N. did not lose a moment. Hurrying north, he gave battle to the allies at Austerlitz, on the 2d of December. The contest was tremendous; but the victory was complete. N.'s opponents were utterly crushed; and next day the Austrian emperor sought an interview, and sued for peace. A treaty was signed at Presburg on the 26th December, by which Austria ceded to France all her Italian and Adriatic provinces; other changes effected by it were, the dissolution of the old German empire, and the formation of the *Confederation of the Rhine* (q. v.).

In February 1806 a French army conquered Naples, and the crown was conferred by N. on his brother Joseph; in the following June, another brother, Louis, was made king of Holland. Prussia now, when it was too late, assumed a hostile attitude. She had bungled off partly through fear and partly through selfishness, from the

great anti-French coalition of the previous year, and now, when circumstances were almost hopelessly adverse, she madly rushed against her colossal enemy. Austria, with more magnanimity than prudence, lent her help, but the star of N. was still in the ascendant. The battle of Jena (October 14) absolutely annihilated the power of Prussia; five days later N. entered Berlin, whence he issued (November 21) his celebrated "Decrees" against British commerce, hoping to ruin her by shutting out her ships from every harbor in Europe. His expectations, it need hardly be said, were disappointed. His policy well-nigh ruined the commerce of his own and other countries, but it only increased the prosperity of England. Her fleets and cruisers swept the seas; nothing could be got from the colonies save through her, and the merchants of the continent were obliged—in order to supply their customers as before—to let her carry on a vast contraband traffic. See **ORDERS IN COUNCIL**.

After the capture of Berlin, N. proceeded northwards to encounter the Russians, who were advancing to the help of Prussia. On his way, he summoned Poland to rise, but only with partial success. At Pultusk (December 28, 1806), and at Eylau (February 8, 1807), the French were beaten and driven back on the line of the Vistula; but after some months, he received heavy reinforcements, and on the 13th of June fought and won the great battle of Friedland, which led to the treaty of Tilsit, signed on the 7th of July. By a secret article of this treaty, Russia promised to close her ports to British vessels. It is important to observe here, that, as the military triumphs of N. increased, the civil and political liberties of his subjects diminished. Consequent on the treaty of Tilsit, a decree of the imperial senate abolished the tribunate—the only political body in France that preserved the semblance of national self-government. In August, N. created his brother Jerome sovereign of Westphalia—having patched up a kingdom for him in his usual unscrupulous way—and soon after, entered on a war with Portugal—the beginning of the great Peninsular War. The occasion of the war was the refusal of the Prince-regent of Portugal to carry out the Berlin decree in regard to British shipping. In March 1808, occurred that extraordinary instance of trepanning at Bayonne, by which the whole royal family of Spain fell into the hands of N.; and in the following July, his "dearly beloved brother" Joseph was ordered to exchange the throne of Naples for the "crowns of Spain and the Indies." His successor was the "handsome swordsmen" (*beau sabreur*), Joachim Murat. Spain rose in insurrection, and an English force, under Sir John Moore, was despatched to its assistance. N. invaded the country about the close of October, defeated the Spanish forces, and captured Madrid (4th December). But his presence was urgently needed elsewhere, and he was forced to let Soult and other generals conduct the war in the peninsula. Austria, again irritated and alarmed at his aggressive policy, especially in Italy (where he had seized Tuscany and the States of the Church), once more prepared for war, which broke out in the spring of 1809. Her army of Germany, commanded by the Archduke Charles, was in splendid condition; but still fortune was adverse. N. hurried into Bavaria, routed the Archduke at Eckmühl (22d April), compelled him to retreat into Bohemia; and on the 12th of May, entered Vienna for the second time. But the struggle was not over. The Archduke rallied his scattered forces, worsted N. in the terrible conflicts of Aspern and Essling (21st and 22d May), and drove him to take refuge for a time on an island of the Danube. The battle of Wagram (6th July), however, once more prostrated, or at least intimidated Austria; and on the 14th of October, she signed the peace of Schönbrunn.

N. appears to have now come to the conclusion, that he could only put a stop to the hostile machinations of the old legitimate dynasties by intermarrying with some one of them. Besides, his wife Josephine had no children—and he was ambitious of perpetuating his power in his family. With that callousness to everything except his own interests, which is a prominent feature of his character, he immediately proceeded to divorce her. The act of divorce was solemnly registered on the 16th December. Less than three months afterwards, he married Maria Louisa, Archduchess of Austria. He was now at the zenith of his power, and so, according to the old Greek belief, Nemesis was on his track. What caused his ruin was really that outrage on civilisation—the Berlin Decrees. Russia found it impossible to carry it out, without permanent injury to her great landowners; Sweden and other countries were in a similar predicament. This led to evasions of the decree, and these, again, involved Russia particularly in further complications, until finally, in May

1812, N. declared war against her; and in spite of the advice of his most prudent counselors, resolved to invade the country. Every one knows the dreadful history of the Russian campaign. N., wringing contingents from all his allies—Germans, Austrians, Italians, Poles, and Swiss—concentrated between the Vistula and the Niemen an army of half a million of men. The vast horde crossed the latter river (24th and 26th June) in three divisions, captured Wilna (28th June), and ravaged Lithuania. The Russian generals retreated before the invading host, deliberately wasting the country, and carrying off the supplies, but avoiding as far as possible, all engagements—their design being to surround N. in the heart of the country, and by the help of famine and the rigors of a northern winter, to annihilate him in his hour of weakness. N. followed up the retreating foe with reckless resolution. He risked everything upon the chance of striking some overwhelming blow. The horrors of his march—in Lithuania alone, 100,000 dropped off (dead, sick, or captured by the swarms of Cossacks that hung upon his flanks)—are too familiar to require description. When he reached Smolensk (16th August), the Russians had just left it—on fire! Three weeks or so later, he made up on the enemy at Borodino, where an obstinate and bloody battle was fought (7th September). The French remained in possession of the field, but of nothing else. A week after, N. entered Moscow, hoping to find rest for a time in the ancient metropolis of the country. But the city was deserted by its inhabitants; and on the 16th a fire broke out, which raged till the 19th, and left Moscow a heap of ruins. After five weeks' stay, N. was obliged to commence his retreat (19th October). His army was reduced to 120,000 men. The winter set in much earlier than usual, and he had to return through the very districts which had been wasted on his advance. When he left Smolensk (14th November), he had only 40,000 fighting-men; when he crossed the Beresina (26th and 27th November), he had not more than 25,000. With the excuse—which was in itself no doubt true—that his presence was urgently needed in France, he now abandoned the miserable remains of his army; and, on the 5th of December, leaving Murat in command, set out in a sledge for Paris, where he arrived on the 18th of the same month. He instantly set about a fresh conscription; and in the spring of 1813 marched into Germany at the head of 350,000 men; but the Russian campaign had broken the spell of terror which his name had till then exercised. The spirit of all Europe was thoroughly roused. A conviction was—somewhat unconsciously—seizing every mind (at the close of the campaign of 1814, even France shared it), that the world had had “enough of Bonaparte” (*assez de Bonaparte*). Prussia, in particular, was burning to wipe out the disgrace of Jena, and all the bitter humiliations to which she had been subsequently subjected. The victories of the British in Spain, the fame of which was spreading all over the continent, also proved to her that French soldiers could be beaten, not once or twice only, but through whole campaigns. An alliance was formed between the king of Prussia and the Emperor Alexander. At first, Austria remained neutral, but afterwards she joined the coalition. N.'s military genius, it has been often remarked, never shewed to greater advantage than in this and the next campaign, which cost him his crown and his liberty. He was for some months successful in winning battles—at Lützen (2d May), Bautzen (21st May), and Dresden (24th, 25th, and 27th August); but the invincible temper of the allies who knew that he was playing his last card, made these victories almost fruitless. They were convinced that one grand defeat would neutralise all his triumphs. This was inflicted, after several minor defeats, at Leipzig—the great *Battle of Nations*, as it has been called (16th, 18th, and 19th October). The result justified their expectations—N. was hopelessly ruined! He commenced his retreat towards France, followed by the allies. When he recrossed the Rhine, he had only 70,000 or 80,000 men left out of his 350,000. All the French garrisons in the Prussian towns were compelled to surrender. N. appeared at Paris 9th November; and though great discontent prevailed in the country, and a spirit of opposition shewed itself even in the legislative body, the senate decreed, at his bidding, another conscription of 300,000 men, with which N. began, in January 1814, to attempt to drive the allies out of France. The skill and energy which he displayed were extraordinary; but they only marked the intensity of his despair. On the 30th of March, the allied forces captured, after a severe engagement, the fortifications of Paris; next day, the Emperor Alexander and the king of

Napoleon  
Narbonne

410

Prussia entered the city *amid the shouts of the populace*; on the 4th of April, N. abdicated at Fontainebleau. He was allowed to retain the title of emperor, with the sovereignty of the island of Elba, and an income of 6,000,000 francs, to be paid by the French government. A British ship conveyed him to Elba, where he arrived on the 4th of May.

After a lapse of ten months, most of which was spent in intrigues, N. made his escape from the island, landed near Frejus on the 1st of March, 1815, and appealed again to France. The army went over to him in a body, and several of his marshals, but the majority remained faithful to Louis XVIII. On the 20th of March, he reached Paris, reassumed the supreme power, promised a liberal constitution, and prepared once more to try the fortune of battle with the allies. At the head of 125,000 men, he marched (15th June) towards Charleroi, on the Flemish frontier, where the English and Prussian forces were assembling. The Duke of Wellington, who, the year before, had completed the deliverance of Spain, was appointed by the Congress of Vienna commander-in-chief of the armies of the Netherlands. The campaign lasted only a few days. On the 16th, N. defeated the Prussians, under Marshal Blücher, at Ligny, which compelled Wellington to fall back on Waterloo, where, on the 18th, was fought the most memorable and decisive battle of modern times. It resulted in the utter and irrevocable ruin of Napoleon. The despot, who knew what awaited him—for France had not recalled him from Elba; he came at the desire of a faction, whose interests were identical with his—returned to Paris. The House of Representatives fiercely insisted on his abdication. He did so (22d June) in favor of his son, Napoleon II.; they further demanded that he should leave the country for ever, and he retired to Rochefort, with the design of embarking for the United States. On the 7th July, the allies again entered Paris, and refused to acknowledge the acts of the French provisional government. N., who saw that he could not escape either by sea or land, voluntarily surrendered (15th July) to Captain Maitland of the *Bellerophon*, claiming the protection of British laws! It was, however, resolved by the British government to confine him for life on the islet of St Helena, a lonely rock in the Southern Atlantic, 1000 miles from the coast of Africa. He was conveyed thither by Admiral Cockburn, and landed at St Helena, 16th October, 1815. The remainder of his life was politically insignificant. His chronic quarrels with his governor—or jailer, as the French prefer it—Sir Hudson Lowe; his conversations with friends and visitors about his past career; his deliberate attempts to falsify history in his writings, are familiar to every one. After more than a year of bad health, he expired, 5th May, 1821. He was buried with military honors. In 1840, his remains were removed to France, and deposited in the *Hôtel des Invalides*.

NAPOLEON II., son of Napoléon Bonaparte. See REICHSTADT, DUKE OF.

NAPOLEON III., nephew of Napoléon Bonaparte. See LOUIS NAPOLEON.

NAPOLEON, or in full, Napoléon Joseph Charles Paul Bonaparte, is the son of Jerome, King of Westphalia, and was born at Trieste, in 1822. When the insurrection broke out in the Romagna in 1831, he was staying in Rome with his grandmother, Madame Letitia Bonaparte, but was forced to leave the city for Florence on account of his consuls (see LOUIS NAPOLEON) being implicated in the revolutionary disturbances. He was educated at a boarding-school in Geneva, and at the Military School of Ludwigsburg, in Würtemberg, completing his studies in 1840, after which he travelled for five years in Germany, England, and Spain. In 1845, he obtained permission to visit Paris under the name of the Comte de Montfort; but his relations with the democratic party, and his advanced political opinions, rendered him suspected by the government, who ordered him to quit the country. He, however, again made his appearance on the eve of the revolution of February 1848. After the fall of Louis-Philippe, he offered his services to the provisional government, and was elected by the *Correlans* a member of the Constituent Assembly, where he voted with the moderate republicans. He held for a short time, in 1849, the office of minister-plenipotentiary at Madrid. After the *coup d'état*, he withdrew into private life; but on the restoration of the Empire he reappeared to share in the honors that now fell thickly on his family. By a decree of the senate, 23d December 1853, he was pronounced a French prince, with the right to a place in the Senate and the Council of State; at the same time, he received the insignia of the Grand Cross of the Legion of Honor, and

—though he had not served—the rank of General of Division. In the Crimean war, he commanded a division of infantry-reserves at the battles of Alma and Inkermann, but soon after returned to France, on the plea of ill-health. N. was President of the Imperial Commission of the Paris Exhibition in 1865. In 1868, he was appointed head of the ministry for Algiers and the colonies, but held the office only for a short time. During the same year he married the Princess Clotilde, daughter of Victor Emmanuel, and in the Italian war of 1869, commanded the French army of reserve in the south of Italy, but was not engaged in actual hostility. In 1861, he made a speech in the senate, reflecting on the Orleans family, for which he was challenged by the Duc d'Aumale. The challenge was not accepted, much to the disgust of the French army. N. was President of the French Commission at the London Exhibition of 1862. In 1865, he was appointed president of the commissions for the Paris Exhibition of 1867, but resigned this post and the vice-presidency of the privy council owing to a reprimand from the emperor about a speech. Afterwards, however, he was intrusted with many delicate missions, and urged the emperor to a liberal policy. He had no command in the late war. In 1874, he was returned to the French Assembly for Corsica; but in the election of 1877 was rejected.

**NAPOLEON-VEKDÉE**, Bourbon-Vendée, or La Roche Sur Yon, a town of France, the capital of the dep. of Vendée, pleasantly situated on a hill on the right bank of the Yeu, 37 miles south from Nantes. The town has no manufactures, and little trade, but derives its importance chiefly from its being the seat of departmental administration. The town contained only 800 inhabitants when Napoleon I. selected it for the capital of the department, granted great sums for its improvement, and called it *Napoleon-Vendée*, changed to *Bourbon-Vendée* at the restoration of the Bourbons, the former name coming again into use under Napoleon III. It is now known as *La Roche sur Yon*. Pop. (1872) 7110.

**NARAKA** is the hell of the Hindus. Manu (q. v.) enumerates twenty-one hells or divisions of N., and gives a general description of the tortures which await the impious there. The Purân's, however, are more systematic. The Vishn'u-Purân'a, for instance, not only names twenty-eight such hells, but distinctly assigns each of them to a particular class of sinners. Thus, a man who bears false witness is condemned to the hell *Raurava* (i. e., Fearful); the murderer of a Brâhman, stealer of gold, or drinker of wine, goes to the hell *Sâkara* (i. e., Swine), &c. Besides these twenty-eight which the Purân'a knows by name, we are told of "hundreds and thousands of others in which sinners pay the penalty of their crimes."

**NARBONNE**, a town in the south of France, in the department of Aude, 55 miles south-west of Montpellier, on a branch (La Robine) of the Canal du Midi. It is the *Narbo Martius* of the Romans; but there is reason to believe that it was well known to the Greeks 500 years before the Christian era. It was colonised by the Romans 115 B.C., and probably got the designation *Martius* from Q. Marcius Rex, one of the consuls at the time. Situated only about 8 miles from the sea, on the direct road into Spain and into the basin of the Garonne, N. was in early times a place of great commercial prosperity. It was the second settlement founded in South Gallia by the Romans, and was considered by them an important acquisition, both for its strength and as the key to the road into Spain. Under Tiberius, it flourished greatly; the arts and sciences being cultivated with success, and its schools rivaling for a long time those of Rome. About 309 A.D., it became the capital of Gallia Narbonensis, and contained among other buildings a capitol, theatre, forum, aqueducts, triumphal arches, &c. It was taken in 719 by the Saracens, who planted here a Moslem colony, and destroyed the churches. In 859, it fell to the arms of the Northmen. During the 11th and 12th centuries, it was a flourishing manufacturing city, but subsequently it fell into comparative decay, and is now entirely destitute of any monument of its former splendor. A considerable number of architectural fragments—as capitals, marble slabs with inscriptions, friezes, &c.—have been found, and have been grouped into a collection of antiquities.

The present very dirty town contains one imposing building, the Cathedral of St Just, founded in 1271, but still unfinished. The honey of N. is the best in France, both for color and flavor. Manufactures are carried on to some extent. Pop. (1876) 12,326.

**NARCISSUS**, according to a Greek fable, was the son of the river god Cephalus and of the nymph Liriope or Liricessa of Thespise, in Boeotia. He was a youth of extraordinary beauty, of which he was excessively vain; and for this he was punished by Nemesis, by being made to fall in love with himself on seeing the reflection of his own face in a fountain. He died of this love-sickness; and on the place where he died, sprung up the flower which bears his name. The story of N., finely narrated by Ovid, is of comparatively late origin.

**NARCISSUS**, a genus of plants of the natural order *Amaryllidaceæ*, having a perianth of six equal petal-like segments, and a bell-shaped corona of various magnitude. The species are natives of the south of Europe, the north of Africa, and the temperate parts of Asia. The Common Daffodil (q. v.) is the only one which can be regarded as truly a native of Britain. Many are cultivated in gardens, for the sake of their beautiful and often fragrant flowers, which in general appear early in the season. Some of them are known by the names of Daffodil (q. v.) and Jonquil (q. v.). The name N. is popularly restricted to those which have flat—not rush-like—leaves, and a short not bell-shaped corona. Of these, one of the best known is the Poet's N. (*N. poeticus*), with generally one-flowered scape, the flower white and fragrant, the corona with a deeply-colored border; others, with one or two flowers on the scape, are in common cultivation.—The **POLYANTHUS NARCISSUS** (*N. tazetta*) has a number of flowers on the scape. It grows wild in stony places near the Mediterranean and eastwards to China. Many varieties of it are in cultivation. It is not only grown in gardens and green-houses, but in water-glasses, like the hyacinth. It is very common in gardens in India, where it is highly esteemed as a flower. The narcissi in general are propagated either by seed, or by offset bulbs. They succeed best in a rich light soil.

**NARCO'TICS** (Gr. *narkê*, stupor) are remedies which, in moderate doses, lessen the action of the nervous system. Their full operation is sleep or coma. Opium is the type: from which most descriptions of this class of medicines have been drawn; but although most narcotics more or less resemble opium in their action, almost every one presents some peculiarity in the way in which it affects the system. These medicines are primarily stimulating, especially when given in small or moderate doses; but this stage of their action is comparatively short; and when the dose is large, the excitement is scarcely perceptible. Their power of inducing sleep has procured for them the names of Hypnotics and Soporifics; while many of them are termed Anodynes, from their possessing the property of alleviating pain. Next to opium, Henbane, Indian Hemp, and Aconite may be regarded as the most important narcotics. It has been already mentioned that there are differences in the mode of operation of the different members of this class. "Some dilate, while others contract the pupil; some appear to concentrate their sedative action more particularly upon the functions of the encephalon, others upon the contractile power of the alimentary and bronchial tubes, while a strict distinction is to be drawn between those which occasion constipation and those which do not; all these things being of great practical importance. Ballard and Garrod's "Elements of Materia Medica," p. 18.

Narcotics are usually administered either with the view of inducing sleep or of alleviating pain or spasm. As, however, their action is much modified by a variety of circumstances—such as age, idiosyncrasy, and prolonged use—they should be administered with extreme caution; and as a general rule, only under competent advice. The various quick medicines for children which are known as *Carmenatives*; *Soothing Syrups*, &c., contain some form of opium, and are a fertile cause of the great mortality that occurs in early life, especially among the poorer classes.

It is almost unnecessary to add, that all the narcotics when taken in excess are poisonous.

**NARCO'TINE** ( $C_{16}H_{25}NO_4 + 2Aq$ ) is one of the organic bases or alkaloids occurring in opium, in which it usually exists in the proportion of 6 or 8 per cent. It is nearly insoluble in water, but dissolves readily in alcohol, ether, and chloroform. Its ethereal solution, when submitted to spontaneous evaporation, yields it crystallised in colorless acicular groups or in rhombic prisms. A mixture of concentrated sulphuric and nitric acids produces a blood-red color with narcotine and its compounds. Narcotine possesses very slight alkaline properties; its salts do not readily crystallise, and are even more bitter than those of morphia, although the substance

itself is almost tasteless. When first discovered (in 1803), it was supposed to be the stimulant principle of opium; but in reality it possesses very little activity. It has been prescribed in gradually increased doses up to a scruple, without the least injury. Its sulphate has been used in India as a substitute for quinine; and nearly 200 cases of intermittent and remittent fevers, treated by it with success, have been published by Dr O'Shaughnessy.

**NARD AND NARDO-STACHYS.** See **SPIKENARD**.

**NARDO** (anc. *Neretum*), a town of South Italy, in the province of Lecce, 8 miles north-north-east from Gallipoli. N. has manufactures of cotton goods and snuff, from cotton and tobacco grown in the neighborhood. The surrounding country abounds in olive plantations. Pop. about 8500.

**NARDOO** (*Marsilea quadrifida*), a plant of the acotyledonous natural order *Marsileaceae* (q. v.), the only plant of that order which is used in any way by man. It has but recently become known to botanists. It is found in Australia, and affords important supplies of food to the natives of some regions; it has also been of great use to some recent exploring-parties. It grows in places occasionally covered with water; vegetating whilst moisture abounds, and then exhibiting abundance of green clover-like foliage, the leaves consisting of three leaflets at the top of a stalk some inches in length. When the water dries up, the remains of the plants are often covered with dried mud. It is then that the spore-cases are gathered for food. They are oval, flattened, about an eighth of an inch in length, hard and horny, and requiring considerable force to pound them when dry, but becoming soft and mucilaginous when moistened. The spore-cases, pounded with their contents, are made into cakes like flour.

**NARDUS**, a genus of grasses, having a simple spike, spikelets all on one side, no glumes; each spikelet consisting of one floret, which has two paleas, the outer ending in a long point. *N. stricta* is one of the most common of British grasses, growing in dry elevated situations, and very characteristic of them. It grows in tufts, and is often called **MAT-GRASS**. It is perennial, purplish, short, rigid, and very worthless, as almost no animal but the goat will eat it.

**NAREW**, a river of West Russia, an affluent of the Bug, rises in the government of Grodno, and flows west-south-west to the main stream, which it joins at Strock, after a course of 294 miles. The waters of the N. are about as great in volume as those of the Bug. It is navigable to Tykoczyn, 150 miles from its mouth.

**NARO**, a town of Sicily, in the province of Girgenti, and 14 miles east of the town of that name. It has 10,253 inhabitants, who trade in oil, wine, and sulphur. Numerous tombs, medals, and other antiquities have been found here.

**NARSES**, a celebrated statesman and general, and almost the last stay of the old Roman empire in Italy. was born towards the last quarter of the 5th century. The place of his birth is uncertain. His parentage was obscure, and he was probably sold as a slave in childhood, having, according to the barbarous usage of the period, been previously emasculated. From some menial office in the imperial household at Constantinople, he rose by successive steps to the post of *cubicularius*, or private chamberlain of the Emperor Justinian, and ultimately to that of keeper of the privy purse. In the difficult art of courtiership, N. long maintained a pre-eminence. More remarkable, however, considering his condition, was the distinction which he attained in military affairs. In 528 he was sent to Italy in command of a body of troops, professing to act in concert with Belisarius (q. v.), but in reality, it is conjectured, with a secret commission to observe and to control that general. After some successes, N. having disputed with Belisarius, assumed an independent authority; but his separate command was unfortunate, and he was recalled to Constantinople in 529. After some years, however, Belisarius was recalled, and N. was appointed to the chief command in Italy. His conduct of that expedition extorted the admiration even of his enemies. Not having the command of a sufficient number of transports, he marched his army along the whole circuit of the shore of the Adriatic, and while the enemy's fleet were still in possession of the sea, was enabled to encounter them in the plain of Santagino, near Targia, where, after a desperate engagement, the Goths were totally defeated, and their king, Totila, slain. N. took possession of Rome, and after a

Narther  
Nasallia

414

series of successes both in Southern and Northern Italy, completely extinguished the Gothic power in that peninsula. Justinian appointed N. exarch of Italy in 553. He fixed his court at Ravenna, and continued, till the death of Justinian, to administer the affairs of Italy with a vigor and ability which did much to stay the progress of that decay which had long infected all its social, political, and military institutions. The only blot on the character of his administration is the avarice with which he is charged by his contemporaries. His exactions pressed heavily on the exhausted resources of the population; though their severity may be in some degree palliated by the splendor and utility of the public works on which he partly expended the public resources. On the death of Justinian, his ascendancy came to an end. The Romans, on the accession of Justin, complained to him of the exactions of N., and that emperor deprived him, in 565, of his office; a proceeding to which a special indignity was imparted by an insulting message from the empress, that it was time for him to "leave arms to men, and to spin wool among the women of the palace." To this bitter taunt (according to Paulus Diaconus, "*De Gest. Long.*" ii. 6), N. replied that he would "spin for her a thread which she would find it hard to unravel;" and he is accused of secretly luring with Alboin, king of the Lombards, to incite a new invasion of Italy, at the same time submissively offering his services to the emperor for the purpose of repelling the invasion. This account, however, seems uncertain, and perhaps improbable; and as N. died at Rome in 568, just on the eve of the Lombard invasion, no light is thrown upon this story by the actual events of the war. His age at the time of his death is a subject of much curious controversy. According to the popular account, it was no less than 95 years; but this is doubted by most of the historians.

NA'RTHEX, a part of the early Christian churches separate from the rest by a railing or screen, and to which the catechumens and penitents were admitted.

NA'RNA, a Russian town in the gov., and 95 m. w. a. w. of St Petersburg, is situated on the Narova, 10 m. from its mouth in the Gulf of Finland. It was founded in 1233 by Waldemar II., king of Denmark, and came into the possession of Russia in 1704. The navigation of the Narova is impeded by a waterfall near N., 14 feet high. In 1873, 163 ships, of 18,175 lasts (1 last = 1 11-14 ton), entered the port; the exports, chiefly flax and timber, were £180,693; the imports, £402,340. At the waterfall above the town there are sawmills, and an extensive cotton-mill, which employs 1700 workmen. Though belonging to the government of St Petersburg, N. is ruled by the laws of the Baltic provinces. Here, in November 1700, Charles XII., with 6000 men, defeated a Russian army of 60,000 men, under Peter the Great and the Duke of Croy. Pop. (1867) 6175.

NARVAEZ, Don Ramon Maria, Duke of Valencia, a Spanish general and statesman, was born at Loja, in Andalusia, 4th August 1805, and when very young, served in the war of Liberation against the French. He was an officer in 1820, when constitutional government was re-established in Spain, and in 1822, when a reactionary party of the royal guard took up arms to destroy the work of the revolution, N. ranged himself on the side of the liberals, and contributed by his courage to the repression of the mutiny. Shortly after, under the command of Mina, he made the campaign of Catalonia against the guerrillas, who were assisted by the monks. The invasion of Spain by a French army in 1823 forced him to retire from active life. He withdrew to Loja, and lived there in obscurity until the death of Ferdinand VII. in 1832. In 1834, as captain of chasseurs, he maintained a hot struggle against the Carlists of the Basque provinces, and signalised himself in various engagements. In 1836, he commanded a division under the orders of Espartero, and in November of that year, completely routed the Carlist leader, Gomez, near Arcos. This was a decisive moment in his career. He now became immensely popular, aspired to the highest offices of the state, and was regarded as the rival of Espartero. In 1838, by acts of terrible severity, he cleared the district of La Mancha of brigands, and was appointed in 1840 captain-general of Old Castile, and general-in-chief of the army of reserve. When Espartero gave General Alaxa a place in the ministry, N. resigned his command. He took part in the insurrection against Espartero that broke out at Seville in 1840, but that having failed, he was compelled to flee to France, where he was shortly after joined by Queen Christina (see MARIA CHRISTINA), and commenced those plots against the government of Espartero which, in 1843, effected its

overthrow. In 1844, he was appointed president of council, and created Duke of Valencia. His ministry was thoroughly reactionary. He recalled Maria Christina, and revised the liberal constitution of 1837. The progressista party was dissatisfied, and petty insurrections broke out, which the rigorous soldier-statesman repressed with an iron hand. But his dictatorial manners finally alienated even his personal friends, and his ministry was overthrown (10th February 1846). After a brief exile as special ambassador at the French court, he returned to power in 1847, but soon afterwards quarrelled with Queen Christina, and found it necessary again to retire from office in 1851. In 1856, on the overthrow of O'Donnell's ministry, he again became president of council, and immediately commenced to strengthen the royal authority, and to restrict the liberty of the press. The intrigues of the court compelled his resignation in 1857. He returned to power in 1864, and (1865) was succeeded by O'Donnell, with whom he suppressed, in 1866, a military revolt in Madrid. He replaced O'Donnell in the same year, and, despite the efforts of O'Donnell and Prim, retained power till his death in 1868.

**NA'RWHAAL** (*Monodon or Narwhalus*), a genus of *Cetacea*, of the family *Delphinida*, resembling *Beluga* (q. v.) in form and in the want of a dorsal fin, but remarkably characterised by having no teeth at all, except two in the upper jaw, supposed to be canines, which sometimes remain quite rudimentary, even in the mature animal, as they are in the young, and are sometimes developed into great spirally twisted straight tusks, passing through the upper lip, and projecting like horns in front. Only one species is ascertained, *M. monoceros* or *N. vulgaris*; the other species which have been described by naturalists having been founded on exaggerations and untrustworthy observations. It inhabits the Arctic seas, and is very rarely found so far south as the Shetland Isles, although an accidental wanderer has reached the coast of England. Narwhals are often seen in great numbers among the ice-fields, and in the creeks and bays of the most northern coasts. They commonly associate in small herds. The tusks are much more frequently developed in the male than in the female, but in the female also they sometimes attain a large size. It is but rarely that both tusks are largely developed, although they sometimes are so, and then diverge a little; one of them generally continues rudimentary, or attains a length only of a few inches, whilst the other becomes a great horn, projecting straight in front, from which the animal has received the name of SEA UNICORN. A mature N. is generally about fifteen or sixteen feet in length, without reckoning the tusk, which is from 6 to 10 feet long. The body is less thick than that of the Beluga; the head is small, the forehead rises abruptly, the muzzle is very obtuse, the upper jaw projects a little; the first half of the body is nearly cylindrical, the remainder to the tail fin is conical. The tusk is hollow nearly to the point. Its use is rather conjectured than known. It is probably a weapon of defence, but Scoresby has suggested that it may be also used for breaking thin ice in order to obtain opportunity for respiration; and for killing fish, as he found remains of skates and other flat-fish in the stomach of a N., which it is not easy to imagine how a toothless animal, with rather small mouth and lips, could capture and swallow, unless the formidable tusk were first employed. Cephalopodous molluscs, however, are believed to constitute a principal part of the food of narwhals. The N. is a very active animal, swimming with great rapidity, lively, and playful. A group of narwhals playing together, projecting their great horns from the sea, and crossing them in their sport, is a very interesting sight. The N. is pursued by the Greenlanders and other inhabitants of the north, for the sake of its blubber, with which its whole body is invested to the thickness of about three inches, amounting to nearly half a ton in weight, and yielding a large proportion of excellent oil. The tusks are also valuable, being of an extremely compact white substance—denser, harder, and whiter than ivory—which is used as a substitute for ivory. The kings of Denmark have long possessed a magnificent throne of this material, which is preserved in the Castle of Rosenborg. The flesh of the N. is used by the Greenlanders as food. Great medicinal virtues were formerly ascribed to the tusks; but were merely imaginary.

**NASA'LIS**, or Proboscis Monkey (*Nasalis larvatus*), a monkey allied to the *Doucas* or *Semnopithecus*, but distinguished from all other monkeys by an extreme elongation of nose, that organ being nearly four inches in length in the mature animal. In the

young, the nose is comparatively undeveloped. The nostrils are placed quite at the extremity of the nose, and are separated merely by a thin cartilage. Of what use the magnitude of its nose is to the animal, is unknown. The N. inhabits Borneo and neighboring islands. It is gregarious. It is an animal of about three feet in height, if placed erect, a position it does not often assume. It can leap fifteen feet or more. Its fur is thick, not long, nor woolly; chestnut red, and in some parts golden yellow.

**NA'SCENT STATE**, in Chemistry. When an element or compound is liberated from some chemical combination in which it had previously existed, the element or compound so liberated is at the moment when it escapes said to be in a nascent state; and it is then often capable of exerting far more powerful combining action with other bodies than it can exhibit when brought in contact with them *after* it has been liberated. Arsenic and hydrogen will not directly combine if brought in contact with one another under ordinary circumstances, but the application of Marsh's test (see **ARSENIC**) depends upon the direct union of the nascent hydrogen (liberated by the decomposition of the water) with the arsenic, giving rise to arseniuretted hydrogen gas. Again, if hydrated protoxide of nickel ( $\text{NiO}, \text{HO}$ ) be suspended in a solution of caustic potash ( $\text{KO}, \text{HO}$ ), it will undergo no change if a current of oxygen gas be passed through the solution; but if a current of chlorine be substituted for the oxygen, the whole of the metallic protoxide will be converted into the brown sesquioxide ( $\text{Ni}_2\text{O}_3$ ), the resulting decomposition being shewn in equation:

This change arises from the action of the chlorine upon the potash, during which chloride of potassium (KCl) is formed, while the nascent oxygen which is liberated from the potash combines with the oxide of nickel. Again, cyanogen ( $\text{C}_2\text{N}$ ) and chlorine do not enter directly into combination, but if cyanogen at the instant that it is liberated from one of its compounds (as, for example, cyanide of mercury) comes in contact with chlorine, the two combine; and many other examples of similar action might be adduced.

**NA'SEBY**, a parish and village of England, in the county of Northampton, 13 miles north of the town of that name. Pop. (1871) 693. The battle of N., between Charles I. and the parliamentary army under Fairfax and Cromwell, took place here, June 14, 1645. It resulted in the total defeat of the royalists, the king being compelled to flee, after losing his cannon and baggage, and nearly 6000 of his army as prisoners.

**NASH**, Richard, better known by the name of *Beau Nash*, a fashionable character of the last century, who attained to a very remarkable notoriety, was the son of a Welsh gentleman, and was born at Swansea, in Glamorganshire, October 13, 1674. After studying at Oxford, he held for some time a commission in the army, and subsequently took rooms in the Temple, but the dissipations of society had more attractions for him than the pursuits of law. He became a dinner-out, a frequenter of good society, and contrived to support himself by gambling. But the grand turning-point in his fortunes was his visit, in 1704, to Bath—a then favorite haunt of elegant invalids, and the scene of the gayest intrigues. N. undertook the management of the public balls, which he conducted with a splendor and decency never before witnessed. In this way he came to acquire an imperial influence in the fashionable society of the place. It appears that he was also distinguished by a species of sentimental benevolence. He played hard and successfully; yet if he heard an individual sighing behind his chair: "Good Heavens! how happy would that money make me," N. would thrust his own winnings into his hands, with theatrical generosity, and exclaim: "Go, and be happy." His own equipage at this period of his career was sumptuous. He used, we are told, to travel to Tunbridge in a post-chariot and six grays, with outriders, footmen, French-horns, and every other appendage of expensive parade. He is praised for the great care which he took of the morals of the young ladies who attended the Bath balls, always putting them

on their guard against needy adventurers—like himself. In his old age, Benú N. sank into poverty, and often felt the want of that charity which he himself had never refused. He died at Bath, February 3, 1761, at the age of 87.

NASH, John, an architect, was born in London in 1752. He underwent the usual course of training for his profession, but soon entered into some building speculations which enabled him to buy a small property in Caermarthen. Here in fresh speculations he lost much money; therefore, in 1792, returned to London and architecture, in which he speedily rose to eminence. On the strength of having obtained a patent in 1797 for improvements in the construction of the arches and piers of bridges, he was in the habit of claiming a great part of the credit of introducing the use of cast-iron girders. A large part of his time was occupied in designing and constructing mansion-houses for the nobility and gentry in England and Ireland, but he is chiefly celebrated in connection with the great street improvements in London. From February 1815, when he was appointed "architect, valuer, and agent to the Board of Woods and Forests," down till near the end of his professional career, he was busily engaged in the planning of routes, grouping of buildings, and fixing of sites. Regent Street, Haymarket Theatre, Langham Place Church, and the terraces in Regent's Park, are specimens of his designs. The Pavilion at Brighton was another of his works. He retired from his profession in 1834, and died May 13, 1835. N., notwithstanding his many defects, possessed great power of effective grouping, as is well shewn in his works. In the architecture of mansion-houses, the designing of "interiors" was his forte.

NA'SHUA, a manufacturing city of New Hampshire, U. S., at the junction of the Merrimac and Nashua Rivers. The falls of the latter afford water-power to six large manufacturing companies, which have extensive cotton-mills, machine-shops, &c. It has ten churches, 8 banks, 2 newspapers. Pop. (1870) 10,548; (1880) 13,397.

NA'SHVILLE, a city, port of entry, and capital of Tennessee, U. S., on the Cumberland River, 200 miles above the Ohio, and a little north of the centre of the state. The river is navigable by steam-boats of 1500 tons fifty miles above Nashville. Five railways connect it with a vast and fertile country. It is a handsome, well-built city, with a state-house, which cost a million of dollars; court-house, 3 universities, hospital, custom-house, theatre, penitentiary, free academy, Protestant and Catholic orphan asylums, 84 churches, with numerous daily, weekly, and monthly publications. It has a large commerce, flour, saw, and planing mills, a large cotton factory (with 400 looms and 13,840 spindles in 1875), manufactories of engines and machinery, &c. The value of the wholesale trade in 1873 was 51,261,570 dollars. Near the city are the State Lunatic Asylum, and the "Hermitage," once the residence of President Jackson. N. was occupied by the Federal troops in 1862, and here the Federal General Thomas gained a victory over General Hood. Pop. in 1880, 43,350.

NA'SSAU, formerly a German duchy, now Wiesbaden, a district of the Prussian province of Hesse-Nassau, in 49° 50'—50° 50' n. lat. and 7° 30'—8° 45' e. long., is bounded w. and s. by the Main and the Rhine, the Prussian-Rhenish provinces, and the grand-duchy of Hesse; e. by the Hesse and Frankfort territories; and n. by Westphalia. Area, 1802 square miles. Pop. (1875) 690,215. Wiesbaden possesses very great physical advantages. In its southern districts, nearly the whole of its area is occupied by the Taunus Mountains, whose highest point, the Great Feldberg, attains an elevation of about 2750 feet. This range includes within its boundaries the fertile valleys known as the Rheingau. The northern part of the district includes the barren highlands of the Westerwald, whose most considerable peak, the Salzburger Head, is nearly 2000 feet high. Besides the Rhine and the Main, which are the boundary-rivers, Wiesbaden is traversed from east to west by the Lahn, which becomes navigable at Weilburg, and is augmented by the confluence of numerous other streams, as the Well, Ems, Aar, Dill, and Elbe. The productiveness of the soil is proved by the excellent quality of the numerous vegetable products, which include corn, hemp, flax, tobacco, vegetables, and fruits, including grapes, which yield some of the most highly esteemed Rhenish wines. The hills are well wooded, and abound with game of various kinds, and the rivers yield an abundance of fish and crustaceans. In the more mountainous districts, iron, lead, copper, and some silver are obtained, together with good building-stone, marble, and coal; the chief mineral wealth is, however, derived from the numerous springs, which, directly and indirect-

Nassau  
Natal

418

ly, bring the government a clear annual gain of more than 100,000 gulden. The most noted of these springs, of which there are more than 100, are Wiesbaden, Weilbach, Langen-Schwalbach, Schlangenbad, Ems, Selters, and Gellman, the majority of which were the property of the duke.

Wiesbaden, which is divided into 12 circles, has few towns of any commercial importance, but it boasts of many fashionable watering-places, which are annually crowded with visitors from every part of the world. Of these, the most considerable are Wiesbaden (q. v.), the capital of the district—pop. (1875) 43,674—Schwalbach, Schlangenbad, Fachingen, Selters, and Gellman. Höchst, an active little place on the Main, is the only manufacturing town of the duchy, but a brisk trade is carried on at many small ports on the Rhine, Main, and Lahn, from whence the mineral waters, wines, and other natural products of the country are exported. The exports are wine—including some of the choicest kinds, as Hochheimer, Johannisberger, Rüdesheimer, Markobrunner, Asmannshäuser—mineral waters, corn, iron, manganese, cattle, &c.; while the imports embrace colonial products, manufactured goods, salt, jewellery, &c.

N. had a representative form of government, based on the constitution of 1814; and the duke, who was also a Count-Palatine of the Rhine, Count of Sayn, Köttingen, Katzenellenbogen, and Dietz, &c., was assisted in the government by a council of state, presided over by a prime-minister. The legislative assembly consisted of an upper chamber, composed of 24 representatives, chosen for six years, and a second chamber, chosen annually. More than one-third of the population belonged to the Catholic Church, which was under the ecclesiastical jurisdiction of the bishop of Limburg, who was assisted by a board of commissioners, located at Eltville, on the Rhine; and excepting about 19,000 persons who belonged to the Jewish and other persuasions, the remainder of the people, including the then reigning house, professed the "evangelical" form of German Protestantism, and were comprehended in one episcopal see under the bishop of Wiesbaden. Ample provisions were made in the district for popular education, in furtherance of which there were upwards of 700 elementary schools, with about 1000 teachers, 10 normal schools, a gymnasium, various training, theological, polytechnic, military, and other educational institutions. In accordance with a treaty with Hanover, Göttingen constitutes the university for arts for Wiesbaden, which has also a Roman Catholic theological faculty in conjunction with Hesse-Cassel at the university of Marburg. Wiesbaden, which is the principal seat for all national institutions of literature, science, and benevolence, has a good public library, containing 80,000 volumes, a museum, &c.

N. occupied, in conjunction with Brunswick, the thirteenth place in the limited council of the diet, but it had two votes in the *plenium*, or full council. It furnished a contingent of 4279, with a reserve of 1833 men, to the army of the old confederation.

The receipts, according to the budget of 1866, were 4,461,410 florins derived from the crown domains and indirect taxes, and 317,935 florins from direct taxation, while the expenditure was estimated at 5,804,975 florins. The national debt at the close of 1864, represented a capital of 6,088,300 florins. The duke, who was in possession of very extensive domains, ranked as one of the richest princes of Germany.

In tracing the history of N. to its earliest origin, we find that the districts now known by that name were anciently occupied by the Alemanni, and on the subjugation of the latter people by the Franks, became incorporated first with the Frankish, and next with the German empire. Among the various chiefs who raised themselves to independent power in this portion of the Frankish territories, one of the most influential was Otto of Laurenburg, brother of King Conrad I., who became the founder of two distinct lines of princes. The heads of these lines were Walram and Otto, the sons of Count Henry I., who, in 1253, divided the land between them. Walram II., the elder, was the progenitor of the house of Laurenburg, which, towards the close of the 12th c., assumed its present name of N. from the name of its chief stronghold; while Otto, the younger, by his marriage with the heiress of Gelders, founded the line of Nassau-Gelders, whose last male representative died in 1423, but which still survives through a female branch, in the family now occupying the throne of the Netherlands. This junior branch of the house of Nassau, by

Inheritance from a collateral representative, acquired possession, in 1544, of the principality of Orange; and since that period, the representatives of the Otto line have been known as Princes of Orange (q. v.). The Walram line, which in 1292 gave an emperor to Germany, in the person of Adolf of N., was subdivided by the descendants of that prince into several branches, until, by the successive extinction of the other lines, the Nassau-Weilburg family, which at present reigns over the duchy, was left, in 1816, the sole heir and representative of the Walram dynasty in Germany. N. had been declared a duchy in 1806, and in 1817 the reigning Duke William granted a new constitution; but during the first sittings of the assembly, dissensions arose between the ducal government and the representatives, the former having attempted to establish the proposition that the ducal domains were the unconditional property of the royal house, and that all the expenses of the state would consequently have to be met by taxation.

This proved a fruitful source of dissension between the duke and his people, and the opposition and discontent to which it gave rise, were not finally allayed till 1834, when a more liberal ministry, under Count Walderdorff, succeeded the unpopular cabinet which had hitherto directed public affairs. Concessions were made by the ducal government, which met the requirements of the chambers, and a satisfactory compromise was effected in regard to the crown revenues. In 1836, N. joined the German *Zoll-Verrein*, and subsequently to that period, it has continued to advance in material prosperity. The reigning Duke Adolphus William, who succeeded his father, Duke William, in 1839, shewed the same conservative tendencies as his predecessor. The revolutionary crisis of 1848 found the people, who had been harassed by over-government and by a jealous dread of liberal sentiments, ripe for insurrection. The peasantry rose *en masse* in the rural districts, and revenged themselves for the severity of the game-laws, and other obnoxious restrictions, by perpetrating the most wanton destruction of game and wood in the forests belonging to the crown and nobility. These disorders were speedily put down by the aid of federal troops, but notwithstanding the concessions made by the government, the relations between the people and their ruler continued for many years to be unsatisfactory. For the events which led to the incorporation of Nassau with Prussia, see GERMANY.

NASSAU, the capital of New Providence, is the centre of the trade of the Bahamas (q. v.). It is pleasantly situated on the face of a hill, in lat.  $25^{\circ} 5' \text{ n.}$ , long.  $71^{\circ} 21' \text{ w.}$  Pop. 9000. The town is well laid out, has several handsome public buildings, and an excellent and well-sheltered harbor. The climate is very salubrious, and N. is a great resort of invalids from the north. It has extensive hotel accommodation, a lunatic asylum, and a leper-house, and is defended by two forts. N. exports cotton, pimento and salt. During the civil war in the United States, it became notorious in connection with the blockade runners.

NASSI'CK, or Nashik, a town of British India in the district of the same name, in the presidency of Bombay. 95 miles north-east of Bombay, on the river Godavery, not far from its source. It is a town of great sacredness in the estimation of the Hindus—more revered than even Benares—is a great place of pilgrimage, the chief seat of Brahmanism in the Deccan, and the residence of many families of Brahmans, some of them living in great affluence. It contains many temples, which are built along both banks of the Godavery, and on rocks in the river. They are all of black basalt, and dedicated to Shiva. Of far greater interest, however, are the Buddhist caves, about 5 miles from the town, which are situated in a conical hill at a height of about 100 yards from its base. They are rudely executed. The figures which they contain are in a state of good preservation, and the leading figures are those of Buddha; but the whole character of the remains is thought to indicate Buddhism in a state of transition or compromise with Brahmanism. One cave is 45 feet square, and its flat roof is wholly unsupported. Notwithstanding the Buddhist origin and character of these caves, the Brahmans of N., for the sake of gain, encourage the popular reverence for them. N. contains a resident pop. of (1872) 22,436.

NASTURTIUM. See CRESS and TROPÆOLUM.

NATAL. The region now forming the colony of Natal derives its name from its being discovered by the Portuguese on Christmas-day 1497. It was visited about

1822 by several white traders from the Cape, who found the country in possession of the Zulu chief Chaka, who ruled in a most sanguinary manner over all the tribes, from the Umzimvulu to the St Lucia River. He was killed and succeeded by his brother Dingaan in 1828, but the latter having treacherously murdered a party of emigrant Dutch Boers, who had paid him a friendly visit by invitation to buy land, he was attacked and finally destroyed by the Boers, who at that time had emigrated from the Cape Colony in large numbers, and who made his brother Panda paramount chief in his stead, and then settled themselves down in the country as his lords and masters. The British government, however, now interfered, and after a severe struggle on the part of the Boers, the country was formally proclaimed a British colony on the 12th May 1843, since which time it has progressed very satisfactorily. In 1856, it was erected into a distinct and separate colony, free from the control of the governor of the Cape. The attention of our colonial office has recently been called to the relations between the European and native population of N., by the case of Langalibalele, a Zulu chieftain, who, on slight grounds of suspicion, was treated very summarily by the colonial government, some of his people slain, and himself banished. The colonial secretary informed the government of the colony that their proceedings were illegal, and in 1875 Sir Garnet Wolseley was despatched to N. as temporary governor, and passed a Reform Bill likely to secure a more satisfactory state of affairs in regard to the position of the two races.

The colony of N. looks out on the Indian Ocean, being situated on the s.e. coast of Africa, about 800 m. n.e. of the Cape of Good Hope, between the 29th and 31st parallels of south latitude. Its n.e. boundary is the Tugela or Buffalo River, which divides it from Zululand, and its s.w. boundary is the Umzimvulu and Umiamous Rivers, separating it from Kaffraria proper. A lofty and rugged range of mountains called the Quathlamba, or Drachenberg, divides it from the Free State and Basutaland, and it contains a well defined area of 20,219 square miles.

These mountains are composed of a confused mass of granite, gneiss, sandstone, basaltic veins, and shale, and present both the flat top and serrated summits of the chain, of which they are a continuation, so well known in the Cape Colony as the Sneeuberg and Stormbergen. About lat. 28° 30', these mountains seem to reach their culminating point, and probably attain a height of 10,000 feet, forming a summit line of watershed, from which flow to all points of the compass the waters of the Orange, Umzimvubu, Vaal, Tugela, and other large South African streams. Towards the coast, these mountains present a scarped and almost inaccessible face; towards the interior, however, they gradually die away into the immense rolling plains of the Free State. Many offshoots from these mountains traverse the colony, dividing it into a series of steps or plateaux, gradually rising from the coast region to the foot of the mountains, and forming so many zones of natural productions.

The coast region, extending about 25 miles inland, is highly fertile, and has a climate almost tropical, though perfectly healthy. Sugar, coffee, indigo, arrowroot, ginger, tobacco, and cotton thrive amazingly, and the pine-apple ripens in the open air with very little cultivation. The midland terrace is more fit for the cereals and usual European crops; while on the higher plateau, along the foot of the mountains, are immense tracts of the finest pasturage for cattle and sheep.

The climate is very salubrious; the thermometer ranges between 90° and 38°, but the heat, even in summer, is seldom oppressive. The mean annual temperature at Pietermaritzburg, the capital, is 64° 71'. The winter begins in April and ends in September; the average number of rainy days being 13. In the summer season the thunder-storms are very frequent and severe. The annual rainfall on the coast is about 35 inches. Inland, it varies a good deal in different districts, and is greatest in summer. The south-east is the prevailing wind here in the summer months, as in the Cape Colony. Occasionally the sirocco or hot wind from the north-west is felt, which generally terminates in a thunder-storm.

N. has but one harbor on its coast, and that is D'Urban, or Port Natal, in lat. 31° 58'. It is completely landlocked, but a bar prevents vessels above a certain tonnage from entering. There is, however, generally a depth of water on it varying from 9 to 18 feet. There is secure holding ground in the outer anchorage. The harbor of D'Urban is of great importance to N., as it is the only one worthy of the name on the south-east coast. Many extensive engineering operations have been carried on with

the purpose of improving the harbor and increasing the depth of water at the entrance. The principal rivers are the Tugela or Buffalo, the Umcomanzi, Umgani, and Umsimela; like the majority of South African rivers, they are of no use for purposes of inland navigation; but their streams are permanent, and often available for irrigating purposes, thus giving N. in one very essential point a decided superiority over the Cape Colony.

Coal, copper-ore, iron, and other minerals are found in several places, and there is no doubt that, when the great mountain-range is properly explored, it will be found very rich in mineral wealth. Large forests of valuable timber abound in the kloofs of all the mountain-ranges, and many tracts along the coast are also well wooded. N. is divided into the following countries: D'Urban, Victoria, Alexandra, and Alfred on the coast region; Pietermaritzburg, Umcomanzi, and Umroli, central; and Klip River and Weenen at foot of the mountains. The capital is Pietermaritzburg, with about 6800 inhabitants, on a tributary of the Umgani River, about 50 mil. inland. It possesses a large military establishment, and many substantial public buildings. Its name is a compound of the Christian name of Pieter Rietief, and the surname of Gert Maritz, two celebrated leaders of the emigrant Boers who were murdered by Dugann. D'Urban, or Port Natal, is also a very flourishing town, having a railway connecting the landing-place at Point Natal with the town, and a population of (1872) 6276. It has 2 newspapers, and several banks and other public institutions. Verulam, Weenen, Richmond, Newcastle, and Ladysmith are also flourishing towns, and several other new villages have been recently formed.

N. is governed by a lieutenant-governor, aided by a legislative council, consisting of thirteen members appointed by the colonial office, and fifteen elected by the constituencies into which the colony is divided. Municipal institutions have been granted to the principal towns. It forms the diocese of a colonial bishop, and many stations of the Wesleyan, American, Norwegian, and Berlin missions exist. Education is receiving much attention, and schools are multiplying.

The De Beer and Bezuidenhout Passes are the only practicable roads across the mountains, and lead by very circuitous routes across the Free State into Cape Colony; and the numerous mountain streams wanting bridges render internal communication very difficult. Three lines of railway, of a total length of 104 miles, are in course of construction; the chief to connect D'Urban with the capital.

The principal articles of export from N. are wool, sugar, ivory, and hides. The wool exported to Great Britain in 1875 was valued at £514,810, and weighed 8,828,524 lbs. The total value of exports for the same year was £955,695. The exports comprise cotton, ivory, sugar, coffee, arrowroot, wool, hides, feathers, molasses, and rhinoceros horns. The value of imports in 1875 was £1,266,838. The revenue of the colony in 1875 was £260,271, principally raised from custom-duties, transfer dues, and taxes on native huts, &c. In 1848, the value of imports was £11,712, that of exports £1261, while the revenue was only £12,000. N. productions were very respectably represented in the Great Exhibition of 1862, and formed one of the most interesting of our colonial compartments. The population consists of Dutch Boers, who remained in the country after it became a British colony; of English and German settlers; and the remains of the Zulu tribes, who originally possessed the country. It numbered, in 1877, 35,512, of whom 22,654 were whites. The natives, the most industrious of the Kaffir races, possess horses, cattle, sheep, &c., valued at £1,500,000, and properly managed, make excellent servants.

The total tonnage of the vessels that entered and cleared the port of N. in 1875 was 137,227 tons, of which 121,822 were British. The discovery of diamond-fields on the Vaal River is an event in which the colony is deeply concerned.

The large animals are gradually disappearing, although elephants are still occasionally met with in the dense bush of the coast region. Lions, leopards, wolves, and hyenas still hang on the outskirts of civilisation. The smaller antelope are plentiful, and alligators are met with in nearly all the rivers north-east of the Umsimela. N., besides several poisonous snakes, produces a small species of boa, which sometimes attains a length of 16 feet. The hippopotamus is still found near the mouths of the rivers on the eastern frontier.

The botany of this region resembles that of Kaffraria proper, although generally of a more tropical character. All the timber-trees of the Cape Colony are found here,

Natal  
National

422

besides many new ones. The climate of the coast region, however, is too warm for the grape, at least for the purpose of wine-making.

Brook's "Natal," by Mann (1869); Hall's "South African Geography;" "Natal Almanac" (1875); "The Cape and South Africa," by John Noble (1878).

NATAL, or Rio Grande do Norte, a fortified seaport of Brazil, capital of the province of Rio Grande do Norte, and built on low lands about three miles from the mouth of the river of that name, 100 m. n. of Parahiba. Pop. 10,000.

NATAL, John William Colenso, D.D., Bishop of, a divine of the Church of England, was born in 1814, and educated at St. John's College, Cambridge, where he graduated as Second Wrangler and Smith's prizeman in 1836. From 1838 to 1842, he was one of the masters of Harrow School, and for the next four years, tutor of St. John's College. In 1846, he was appointed rector of Forncett St Mary, in the county of Norfolk, and in 1864, first bishop of N., South Africa. The works by which he was, until recently, most widely known were his two treatises on Algebra and Arithmetic. The treatise on Algebra was first published in 1849, and that on Arithmetic in 1863. They soon acquired great popularity, and have been adopted as text-books in many of the principal schools and colleges in Great Britain. He has also published other educational works. He first attracted public notice, however, by the dedication of a volume of Sermons to the Rev Mr Maurice (q. v.), at the moment when that gentleman was in disgrace with the "orthodox" section of the religious world. His affection and respect for Mr Maurice were further shown by his edition of the "Communion Service, with Selections from Writings of the Rev F. D. Maurice" (1855). In the same year appeared his "Ten Weeks in Natal;" in 1861, his "Translation of the Epistle to the Romans, commented on from a Missionary Point of View;" and "A Letter to his Grace the Archbishop of Canterbury, upon the Question of the Proper Treatment of Cases of Polygamy, as found already existing in Converts from Heathenism," in which he recommends, on grounds both of reason and Scripture, that Converts to Christianity, already possessing several wives, should not be forced to put them all away, except one. He admits that monogamy is most in harmony with the genius of Christianity, but would enforce it only in the case of those who married after their conversion. The outcry raised by his professional brethren against the "Letter" was sufficiently loud, but it was nothing to the tempest of disapprobation that burst forth in the following year (1862), when he published "The Pentateuch and Book of Joshua Critically Examined," in which he endeavored to prove that, as they stand, these books are not the products either of the age to which they are usually assigned, or of the authors whose names they bear; and that they are not entirely historical, but in many most important passages are overlaid with legendary, mythical, and symbolical incidents. Part VI. of this work was published in 1872. The Bishop of Cape Town, the metropolitan bishop, declared Colenso deposed from his see; but on an appeal to the Privy Council in 1865, the deposition was pronounced null and void. In 1874, Colenso visited England to plead the cause of Langalibalele (see NATAL). Other works by the bishop are "Natal Sermons" (1866); and "Lectures on the Pentateuch and the Moabite Stone" (2d ed., 1878).

NATANT. See NAIANT.

NATATORES (Lat. swimmers), the name given by Illiger, and many other ornithologists, to the order of birds called *Palmipedes* (q. v.) by Cuvier.

NATCHEZ, a city and port of entry in Mississippi, U. S., on the east bank of the Mississippi River, 230 miles north of New Orleans. It is finely situated on the bluff, 150 feet high, which here forms the bank of the river. A portion of the town at the bottom of the bluff is called Natchez-under-the-Hill, and was formerly the resort of the river gamblers, pirates, and other desperate characters. The city has eight churches, a court-house, jail, United States Marine Hospital, a daily and two weekly papers. It is the shipping port of a large and fertile cotton district, and has steam-boat connections with the whole Mississippi valley. N., which derives its name from a noted tribe of Indians, was settled by the French in 1716, and destroyed by the Indians in 1729, who were subsequently defeated, and banished to the West Indies. Pop. in 1870, 9057; 1880, 7038.

NATION (Lat. *natio*, from *natus*, born), a word used in two distinct senses. 1.

A state or independent society united by common political institutions; 2. An aggregate mass of persons collected by ties of blood and lineage, and sometimes of language. The modern dogma of nationalism, as maintained by a class of continental politicians, starts from an assumption that a nation in the latter sense ought necessarily to be also a nation in the former, and endeavors to assign limits to the several races of Europe, with the view of erecting each into a distinct state, separated from other states or nationalities. The extreme politicians of the national school seem to consider the supposed rights of nationalities as paramount even to the obligations of treaties, and the political conjunction of one nationality with another is looked on by them as an adequate ground for a revolt or separation, apart altogether from the question whether the nationality is well or ill governed. In point of fact, the different races in Europe are so commingled, that any reconstruction of the political map of Europe, on ethnological principles, would be impossible, even if desirable. The blood of nine-tenths of Europe has been mixed within the historical period. The test of language, on which nationality has sometimes been based, is a deceptive one, in so far as it is indefinite and perpetually fluctuating. The people on the frontier between two races, as in the South Tyrol, generally speak two languages. Then we have dialects, like the Walloon, the Gröduerisch of the Tyrol, and the Romansch of the Grisons—as also the Breton, Welsh, Gaelic, and Irish languages, which could hardly be made the basis of independent communities. The wellbeing of the people governed is properly the end of all government, and it has practically not been always found that a state is better governed when it consists of one race only, than when it includes an aggregate of races. Highly diversified nationalities may be united in one political system, provided only that the government respects and consults the peculiarities of the several races, and does not attempt to force the usages, habits, or language of one on the rest. See ETHNOLOGY.

**NATIONAL CONVENTION**, an assembly of deputies of the people, which assumed the whole government of France on the overthrow of the throne in 1792. When the National Assembly (see ASSEMBLY NATIONAL) had decreed the suspension of the king, 10th August 1792, it appointed the election of the N. C., which commenced its sittings 21st September. Its first act was to declare France a republic, 25th September. Upon this followed the trial and condemnation of the king. Through the support of excited mobs, the extreme Jacobin party became predominant in the Convention; where, from the elevated seats on which its members sat, it received the name of the *Mountain* party. The *Revolutionary Tribunal* was established; the chief administration of affairs was intrusted to the *Committee of Public Safety*, which exercised the most despotic powers. The Girondists (q. v.), at first a powerful party in the Convention, were destroyed, many of them perishing by the guillotine; and a new constitution, thoroughly democratic, was adopted, 16th August 1793; but its operation was suspended until peace should be restored. Meanwhile, the actual rulers of the country displayed marvellous energy; almost a million of citizens being placed under arms, and immense provision of all warlike stores made by means of requisitions. They also proceeded with merciless severity against their political opponents, dealing with them as traitors; hundreds of thousands were thrown into prison, and the number who died by the guillotine increased daily both in Paris and throughout France. The N. C. itself latterly became subject to the dictatorial power of Robespierre; many of its members were guillotined within a few weeks; and independent opinion was no longer expressed. The overthrow of Robespierre was followed by a great reaction; the Jacobins were suppressed; and finally the N. C., after concluding peace with Prussia and Spain, dissolved itself 26th October 1795 (4th Brumaire of the year IV.), leaving to the nation a new constitution, which placed the government in the hands of a Directory (q. v.).

**NATIONAL COVENANT**. See COVENANT.

**NATIONAL DEBT**. See DEBT, NATIONAL.

**NATIONAL EDUCATION**. The general subject of Education has been already treated under that head. By the term "National Education" is understood (1) the means taken by the body of any nation, either through the state or other organisations, for educating the people; (2) the objects which the nation ought to place before itself in its educational measures. These questions involve the whole inner and outer history of education, and are far too large and important to be capable of such

treatment here as would convey accurate notions to the reader. All we can do is to glance slightly at the history of the two branches into which the subject divides itself. Among ancient nations, and among not a few nations now existing, education in any definite sense did not, and does not, exist for the masses of the people. The children grow up in reflective or unreflective imitation of their fathers. But at all times, nations which have quite emerged from the savage state, have had some more or less organised scheme of education for the leisured and governing classes. The purpose kept in view in such education has been to fit the pupils to discharge certain duties of war or government. In addition to this, the priesthood had the education which their traditional hymns, laws, and customs afforded. That man as such, apart from any special practical ends, should be educated, was an idea late of being recognised, and occurred first to the Greeks, to whom the world owes so much. But neither among them nor their imitators, the Romans, was the education of the masses of the people ever contemplated. Education, properly so called, was confined to a few. In the centuries which succeeded the introduction of Christianity, the church was the great educating body—training those intended for the service of the altar, not only in Christian doctrine, but in all the learning of the past. This, at least, was the general tendency of education in the church. But it was not till the Reformation in the 16th c. that learning, even to the limited extent of reading and writing, was considered a worthy object of pursuit by any save those who, in some form or other, were destined to be drawn within the clerical ranks. The Reformation introduced the idea of educating the masses of the people—the leaders of this movement being, no doubt, forced to this conclusion by the necessity which their view of man's personal religious obligations imposed on them. It was manifestly a corollary from the position they took up that every man's intellect should be so trained as to be able to read, and inquire, and think for itself. It was only very slowly that so large a conception of the sphere of education could be given effect to. Gradually, however, popular schools arose in many parts of the continent of Europe, especially in Germany, and the number of gymnasia or grammar-schools was, during the same period, increased. In Scotland, so early as 1666, the government took up the matter, and ordained that there should be a school as well as a church in every parish, at the same time providing for their maintenance by a tax on land, and for their management by putting them under a certain number of those who paid the tax conjointly with the minister of the parish—all being subject to the presbyteries within whose bounds they were situated. The example of Scotland cannot be said to have been followed on anything like a national scale by any country till after the French Revolution had exhausted itself. Since 1815, the distinguishing idea of government administration may be said to be the necessity of educating the people, and all the people—even the outcast and the criminal. During the last fifty years, all the German states, and more especially Prussia and Saxony, have developed excellent national systems of education, and France has followed their example. Russia and the new Kingdom of Italy are also now organising primary instruction; and at the same time, as in all European countries, they are making provision for the instruction and professional training of the teachers in Normal Schools (q. v.). The schools for instructing the middle classes, and grammar-schools (French, *lycées*; German, *gymnasiums*), whose object is to prepare pupils for the universities, have received increased attention. Universities themselves, too, have been further developed, their curriculum extended in range, their objects elevated, and their number increased.

To return to primary instruction. In England there was no national system, properly so called, before 1870, but voluntary efforts were largely aided by the state in the form of Privy Council grants. These grants were also extended to Scotland, as it became necessary to supplement the parochial schools there, owing to the increase of population. The principal conditions on which these grants were made were, that they were only to supplement local efforts, that the schools should pass a satisfactory examination before a government inspector, and that the Bible be read in them. As much additional religious instruction might be given as the school-managers pleased, but no schools were admitted to Privy Council aid from which the Bible was excluded. Under the stimulus afforded by these grants, the educational wants of England were, after 1839, to a great extent supplied; but many districts were left unprovided with schools, and many more very badly supplied. In

1870, an important measure, entitled "An Act to provide for Public Elementary Education in England and Wales," was passed by parliament, according to which it is enacted that "there shall be provided for every school district a sufficient amount of accommodation in public elementary schools available for all the children resident in such district, for whose elementary education efficient and suitable provision is not otherwise made." It is enacted further, that all children attending these schools, whose parents are unable, from poverty, to pay anything towards their education, shall be admitted free, and the expenses so incurred be discharged from local rates. The new schools are placed in each district under "school-boards" invested with great powers—among others, that of compelling parents to send their children to school. An act in most respects similar to the above was passed in 1872 for Scotland, whose educational wants had previously been well supplied.

In Ireland, a national system instituted and maintained by the state exists, and one of its main features is the separation of the religious from the secular teaching—at least in theory. The extent to which this principle has been encroached upon in the course of working out the scheme, is not accurately known, but is worthy of special inquiry.

In the British colonies, as in the United States of America, adequate state systems of education have been provided on the basis of the secular principle. See the articles NATIONAL EDUCATION, and PRIVY COUNCIL, COMMITTEE OF, ON EDUCATION.

**NATIONAL EDUCATION**, Systems of, the provision made by various states for the education of their citizens. In England, the term national education is commonly used as implying only a provision made for the instruction of children of the poorer classes. But it is capable of a much more extensive application, and in most of the countries in which the state provides for the education of the people, the state regulates, more or less, all instruction, from that of the primary school to that of the university. In England national education has no existence. The Parish Schools (q. v.) of Scotland at one time made a near approach to being national, but the altered religious circumstances of the country have made them cease to be so. The imperfect means adopted to supply the deficiency in both parts of the kingdom, are described under the head of PRIVY COUNCIL, COMMITTEE OF, ON EDUCATION. See also SCHOOLS, PUBLIC AND GRAMMAR; INDUSTRIAL SCHOOLS; REFORMATORY SCHOOLS, &c. In Ireland the foundation of a really national system was laid in 1833 in the "National Schools" (supplemented since by the Queen's Colleges and University), the principle of which is briefly stated under IRELAND. These schools have exhibited a steady and even surprising progress, when we consider the determined opposition they have met with from powerful ecclesiastical parties, both Catholic and Protestant. In several of the British colonies the local legislatures have boldly dealt with the question on the national principle, in opposition to the denominational. See VICTORIA. As this is likely to be one of the first important subjects to come before the reformed parliament, it may be opportune to give our readers a sketch of what some neighboring nations have done in regard to it. Before entering upon the description which we propose to give of the principal systems of national education, it will be proper to give some account of the obstacles which have hitherto prevented the establishment of a national system among ourselves, and to indicate some of the matters as to which we have to look for instruction from foreign experience.

And, first, in Great Britain the establishment of a national system of education, and of all interference with education on the part of the state, has until lately been opposed upon principle by a numerous and respectable body of politicians. They for the most part consisted of Dissenters of the middle class, who, beginning with Voluntaryism in ecclesiastical matters, had passed on—at least the leaders had—to the doctrine of *laissez faire* in politics. The others were chiefly speculative persons, deeply imbued with the same doctrine, who, profoundly disbelieving in the wisdom of statesmen, and the capacity of officials, and apparently in the possibility of foresight in large affairs, held that the state should undertake as little as possible, and leave things to what they called their natural course. The arguments used by these two classes were not always alike. Individuals of the former class were apt to go back to the religious ground from which they started, maintaining that education ought to be religious, that the state ought not to teach religion, that

therefore education was out of the province of the state. But what the spokesmen of both classes most insisted on was this, that education should be left to the law of supply and demand, or rather, to the voluntary action of individuals, single or combined. It was in that way, they declared, that the education of the people could be most beneficially carried on; for so carried on, it would always be, both in kind and in extent, what, on the whole, the circumstances of the people required. In the hands of government, they said, an educational system must be, more or less, an instrument of state. And at the best, the extent and the quality of the instruction provided must depend upon the will of persons who might be very ignorant of the wants of the people. They used declamation about the bad way in which governments did everything they attempted; about the danger of creating a host of new officials; and about the impropriety of interfering with natural laws and of discouraging voluntary agency. Then they enlarged upon the great progress which education had made in England since the beginning of this century, independently, as they said, of the state—maintaining not only that it had been as great as the circumstances of the country permitted, but that it was almost as much as the state had accomplished in any country; and that it proved that in England, supply and demand, or the voluntary principle, would soon provide for the education of the whole people. The greater part of the increase in the supply of education, so far as it was not due to the action of the state, had come from the benevolent exertions of individuals. But their chief reliance was upon the agency of individuals or societies inspired by benevolence or religious zeal. They held that the same objections did not apply to voluntary organisations which lay against the state; they declared that it was the great glory of England to accomplish by such means things which elsewhere were attempted only by the state. Combined voluntary action, they said, was consonant with the national habits and institutions; it was a part of the system which had made the English a free, self-reliant, and enterprising race; it should be fostered, not discouraged; and it was worth our while to pay a price if necessary, rather than let it be superseded by the action of the state.

It was answered, first, that the commercial principle of supply and demand, unless supplemented by the benevolence of individuals, could not be expected to educate the people except by very slow degrees; that education must create the demand for education; that children of the lower classes in large towns, unless assistance or stimulation came to them from without, had at present no more chance of receiving instruction than if they were living in Africa. And the nation would lose incalculably by delay in educating the masses; for nothing would so greatly increase its power and prosperity, so materially improve the condition of the humbler classes, as the education of the whole people. The importance of voluntary agencies was admitted; but why was the state to be precluded from at least co-operating with them? The state, it was said, had a greater interest in educating the people than any of her citizens could have; and, moreover—this was the real question—could undertake it more successfully. Voluntary agency, it was maintained, was too slow, too uncertain, too spasmodic in operation, to be permanently and solely relied upon in a matter of such great national concern. The friends of state action confidently appealed to the experience of foreign countries as shewing the superior efficiency of state education, and pointed to the effects which government stimulation on a limited scale, had had at home. It is now several years since this controversy was at its height. The Voluntaries have since that been acquiescing in the interference of the state with education; and recently, several of their foremost men have frankly admitted that they had been mistaken, and that the state, by what it has done for education, has made good its claim to the regulation of it. The course of political events has recently added greatly to the importance of popular education; and at present it may be said that there is practically no opposition upon principle to the control of education by the state.

There have always, however, been obstacles to the establishment of a national system more formidable than the opposition of the Voluntaries, and these appear to remain unabated.

The most important of them are those which are concerned with the place, if any, to be assigned to religion in the school instruction. Upon this matter, there is a conflict of opinions which seems almost irreconcilable. A party, which is growing

in numbers, and which is respectable from its activity and intelligence, holds that the state should give nothing but secular instruction; that religion is beyond its province, and should not be taught within its schools; that, indeed, with a population divided into numerous sects, a practicable scheme of state education, embracing religion cannot be devised. To this party, a portion of the English Voluntaries now seems disposed to ally itself. There are others who believe it possible to teach an undenominational Christianity in schools; who desire that the state schoolmaster should confine himself to this; and that dogmatic teaching should be left to the religious bodies. A third party hold that dogmatic teaching should be given in state schools; that religious teaching, to have any value, must be dogmatic; but that arrangements might be made for the religious instruction of children by persons of their own persuasions; and, at anyrate, that children should be exempted from the religious instruction given in a school, if their parents should so desire. The most numerous body of all are satisfied with the system of aiding denominational schools which now exists; because they approve of schools being, as for the most part they now are, under clerical supervision, and fear that by any change the influence of the clergy upon education would be weakened. Among the managers of Church of England schools, fault is scarcely found with more than one point in the present system; there is an incessant agitation against the "Conscience Clause," which the state has placed among the conditions of its aid, by which it is stipulated that religious instruction shall not be given contrary to the wish of the parent. Between the Denominationalist and the Secularist there is a difference which scarcely admits of compromise; and until they agree, a national system is hardly possible. The former would most probably oppose any scheme for supplementing the Denominational system—for the purpose of educating the classes which this system does not educate—unless it were to include religious teaching.

The question of religious instruction has been found a troublesome one in nearly every country where the state regulates education, and there is nothing more instructive, in foreign experience, than the ways in which, in different systems, this difficulty has been disposed of. Next to this, the most important thing to be observed is, the parts which, in different systems, are assigned to the state and to the locality respectively; for it is unquestionable that there are some dangers attaching to state education, when the influence of the state is predominant, and that the function of the state in education must be carefully defined. By the mere selection of schoolbooks, the state could powerfully influence the rising generation; and in Austria, and, it is said, in France also, the school has been made use of as an instrument of state policy. With a popular government, however, there is not much risk of it being used for sinister purposes; and in this country, we are in more danger of having recourse too little to the powers of the state than of trusting it too much. The possibility of making education compulsory, is another matter upon which foreign systems of education throw much light: we are perhaps more interested in noting how far indirect methods can be resorted to for compelling attendance at the schools. Upon the limits of the instruction which should be attempted in schools for the poorer classes—a subject which has been much discussed in connection with the Revised Code of 1861—and upon the results of government regulation of the middle and upper schools also, there is much to be learned from the foreign educational systems. We begin with

#### *State-education in Holland.*

There are several countries in which—if school statistics could be taken as a test—popular instruction is more widely diffused than it is in Holland; but in no European country is it so uncommon to meet a man who cannot easily read and write. The primary schools of Holland have a high reputation for the solidity of the instruction they impart, and have, by competent observers, been declared to be the best in Europe. A small and wealthy state—rich, too, in the public spirit of its citizens—with a population singularly docile and orderly, the task of educating the people has been for Holland exceptionally free from difficulty. It had the start of most other European nations in the work of popular education. So far back as 1811, its primary schools had been celebrated in a Report by the famous Cuvier. It has had an educational law since 1806; and of this law, though it underwent modification in

1857, it is necessary to give some account. Its author was M. Van Den Ende, who, from 1806 till 1833, had the superintendence of popular education in the country.

On the face of it, this law seemed far from making a complete provision for the education of the people; it left much—in any other country, it would have been a great deal too much—to the public spirit of local authorities. It did not make education compulsory; it did not even enforce the establishment of public schools; but it provided for two things being done thoroughly—the inspection of the schools and the examination of the teachers—and to this seems to have been chiefly due its eminent success. Each province of Holland was formed into a certain number of school-districts, and over each school-district was placed an inspector. The inspector was made supreme over primary instruction in his district. He was a member of every school-committee, and school-committees could be named only with his concurrence; no teacher, public or private, could exercise his calling without his permission; and he inspected every school in his district twice a year. The united inspectors of the province formed the provincial commission for primary education. This commission met three times a year, and received from each of its members a report upon his district; once a year, it sent a deputy to the Hague, to form, with the deputies from other provinces, a commission to discuss and regulate school-matters, under the direction of the Minister for the Home Department and his Inspector-general. The inspectors in the various provinces were appointed by the Home Office, on the presentation of the provincial commission. It has been said that in Holland public spirit is very strong. State-employments are thus deemed very honourable; and the inspectors gave their services gratuitously—receiving only an allowance for expenses. It was one of the duties of the provincial commission to examine teachers for certificates. First, the teacher had to get a *general admission*—a certificate of competency, admitting him into the teaching profession; he had to get a *special admission*, also, before he could exercise his profession. There were four grades of certificates—the first or second grade had to be obtained by a school-master, public or private, in the towns; the third grade qualified for a village-school; the fourth grade was for under-masters and assistants. To the highest grade were admitted those candidates only who gave signs of a *distinguished culture*. For public masterships, when they fell vacant, a competitive examination was held; the successful candidate received his *special admission*—his appointment to exercise his profession in the school. For special admission as a private teacher, there was no second examination; it was in the power of the municipality, with the concurrence of the inspector, to grant it upon application. Although there were no obligatory provisions in the law, the provincial and communal administrations were charged by the government to provide the means of instruction in their localities, to insure a comfortable subsistence for teachers, and to obtain a regular attendance of the children in the schools; and they did all this to the best of their ability. Free schools for the poor were provided in the towns; in the villages, schools to which the poor were admitted gratuitously. Every effort was used, both by the lay authorities and the clergy, to draw poor children into the schools; and the schoolmasters were provided with incomes much superior to what is usually paid to schoolmasters in any other European country. To this M. Cuvier attributed much of the success of the Dutch schools. Some of the best scholars were kept in the school to assist in the teaching; they became under-masters, and eventually masters; and thus, even before the institution of normal schools, an efficient body of teachers was provided. In the normal schools which were afterwards established, school-methods and the practice of teaching formed a more prominent part of the instruction than in those of other countries. It soon appeared, that the free schools for the poor in towns were giving better instruction than could be obtained by the lower middling classes; and intermediate schools had to be established in the towns (*tusschen-schoolen*), in which, for a small fee, an excellent education was provided. Above the intermediate school was the French school, in which, besides a sound commercial education, modern languages were taught; above that was the Latin school, giving a classical education, and preparing for the universities. The classical schools and the universities of Holland do not receive from foreign observers the commendation so freely bestowed upon the other parts of the educational system of the country.

Under this law, the public schools were non-denominational; no dogmatic in-

struction was to be given by the teacher or in the school; but the instruction was to be such as to "train its recipients for the exercise of all social and Christian virtues. The religious education of the children, however, was not overlooked. The government exhorted the clergy of the different communions to take upon them the religious instruction of children of their own persuasions; and this the clergy willingly did—giving up a portion of every Sunday to this duty. The schoolmaster instructed the children in the truths common to all religions, and on Saturdays, when the Jews were absent, in the New Testament and the Life of Christ. M. Cuvier, in 1811, stated that he found the education religious, though not dogmatic; and in 1834, high satisfaction with it was expressed by M. Cousin, an earnest advocate of religious education. It was thought that the Dutch schools had proved the possibility of teaching in schools an unsectarian Christianity. But it was chiefly upon this point that the controversy arose which led to the enactment of 1857; and as regards it, it cannot be said that the controversy is yet ended.

There were other matters which excited a demand for the alterations then made in the law. The constitution of 1848 had granted the liberty of instruction, and was therefore in conflict with the law of 1806. The school attendance had been falling off. Some of the municipalities had been evading their duty to the schoolmasters and the schools. It was thought desirable that the duties of the commune in regard to education should be carefully defined by law. The changes made, however, were not of much practical importance.

The law of 1857 granted "liberty of instruction;" still requiring from the private teacher the certificate of competency, it rid him of the veto of the municipality and the inspector. It expressly prescribes that primary schools, in each commune, shall be at the commune's charge; they are to be in sufficient number; and the states' deputies and the supreme government are to judge whether, in any commune, they are in sufficient number or not. If the charge of its schools is too heavy for a commune, it receives a grant in aid, of which the state and the province each contributes half; but there is no fixed point at which the commune can demand this aid. The law fixes the minimum salary for a schoolmaster at 400 florins (about £84); for an under-master at 200 florins. (The schoolmaster's salary, however, is usually much higher; in towns, not unfrequently four times as much.) It provides that when the number of scholars exceeds 70, the master is to have the aid of a pupil-teacher; when it exceeds 100, of an under-master; when it exceeds 150, of an under-master and pupil-teacher; for every 50 scholars above this last number, he is allowed another pupil-teacher; for every 100 scholars, another under-master. School-fees are to be exacted only of those who can afford to pay them; and the municipalities are enjoined to "provide as far as possible for the attendance at school of all children whose parents are in the receipt of public relief." The law defines the subjects of primary instruction as follows: Reading, writing, arithmetic, the elements of geometry, of Dutch grammar, of geography, of history, of the natural sciences, and singing. There is still a competitive examination for the office of public schoolmaster; a list of those who have acquitted themselves best is made up by the inspector and a committee of the communal council, and from this list the selection is made by the whole body of the council. For the provincial commission, consisting of the inspectors of the province, there has been substituted a salaried provincial inspector; and the provincial inspectors are assembled once a year to deliberate upon the state of primary instruction. The Minister of the Home Department, assisted by a referendary, is the supreme authority in matters connected with education.

Upon the subject of religious instruction, the law was left unaltered. The enactment of 1857 provides as follows: "Primary instruction, while it imparts the information necessary, is to tend to develop the reason of the young, and to train them to the exercise of all Christian and social virtues. The teacher shall abstain from teaching, doing, or permitting anything contrary to the respect due to the convictions of Dissenters. Religious instruction is left to the different religious communions. The schoolroom may be put at their disposal for that purpose, for the benefit of children attending school, out of school-hours." This was the conclusion arrived at, after much excited discussion.

In 1848, all religions were, in Holland, placed by the law on a perfect equality; and immediately thereafter, an attack was begun by the Roman Catholics on the reli-

gious instruction of the schools. Professedly neutral, they maintained that it was really Protestant, and probably they were right. The schoolmasters, on the demand of the Roman Catholics, were enjoined to comply more strictly with the law; add thereupon there began among the orthodox Protestant bodies a violent agitation against the law—a movement for connecting every public school with some religious communion. The Roman Catholics, believing that in Holland neutral schools must be Protestant, desired that the instruction should be purely secular; and a considerable party among the Protestants contended for the same object. The only party in favor of the existing law were the Rationalists or New-school Protestants, who attach more importance to the moral and civilizing side of Christianity than to its dogmatic aspects. Between the Denominationalists on one hand and the Secularists on the other, the victory fell to this last party. Of course, the decision was a compromise; and neither the High Protestant party nor the Roman Catholics regard it with satisfaction. The consequence has been that, advantage being taken of the newly-conceded freedom of instruction, there has been a great increase in the number of private elementary schools conducted on the denominational basis. The non-denominational school in Holland cannot be considered entirely successful, since the opposition to it seems to be leading to primary education being to a considerable extent taken out of the control of the state.

*State-education in Switzerland.*

In no part of Europe has the education of the people been more successfully prosecuted than in Switzerland. In all the cantons, French and German, it has been carefully attended to by the governing bodies; and for small communities, provided the rulers have intelligence and public spirit, it is comparatively a simple and easy task. To those who are interested in school-methods and school-management, nothing can be more instructive than the education of the German cantons. Their primary schools are unsurpassed; those of the canton Aargau have the reputation of being the best in Europe. The experience of the French cantons throws light upon more than one of the questions which occur in the construction of a national system. It is with the latter class of questions that we are concerned; and to the French cantons—Geneva, Vaud, Freiburg, Neuchâtel, and the Valais—the following statement is confined.
